Urban Flooding Solutions

- Jim Morgan, City of Pacific – Flooding is multi-causal with both riverine and urban flooding. The urban flooding is a result of the riverine flooding. Removal of sedimentation is the only thing that will help the problem unless you build more pump stations.
 - Government canal – is there potentially some type of solution that could be developed to keep the canal from flooding?
 - If the river stays full for too long, you get percolation of the groundwater.
 - With pump stations, you have to have a very good telemetry system.
