The County Council adopted open space priorities in 1998. These priorities were established for any County program that provides for the preservation of open space. Open space resources were categorized as high, medium, or low priority for preservation or acquisition. In 1999 the County Council adopted a Comprehensive Plan text amendment which established a revised open space/greenbelt map based upon the high priority open space categories (critical salmon habitat, fish and wildlife habitat, wetlands, tidal marshes, estuaries, rivers and streams, marine waters, and wooded areas). These areas will receive the highest priority for any Pierce County programs that acquire or otherwise preserve lands for open space.

**PIERCE COUNTY COUNTY-WIDE PLANNING POLICIES**

All jurisdictions within Pierce County participate in the development of the County-Wide Planning Policies (CWPPs.). Each jurisdiction’s comprehensive plan needs to be consistent with the policies established in the CWPPs. The Pierce County CWPPs require all jurisdictions to plan for the provision of open space; consider as open space parks, environmentally sensitive lands and greenbelts, natural buffers, scenic and natural amenities unique geological features; designate appropriate open space; and encourage new housing to locate in a compatible fashion with open space designations or outside designated open space.
The Pierce County Comprehensive Plan contains several policies that address open space. These policies establish some general criteria for areas that should be considered for open space. These criteria include areas where natural processes (e.g., wetlands and tidal actions) occur or sites that contain unusual landscape features (e.g., cliffs and bluffs), wooded areas, environmentally unique areas, and parcels which provide connectivity in the open space network. The open space/greenbelt areas within the County are depicted in the map referenced in policy 19A.30.170 I. Section 19A.30.130, Objective 57A, states County programs which provide for preservation of open space shall have established priorities and these priorities will be used to rate open space proposals for Conservation Futures funding, Open Space Current Use Assessment taxation, Development Regulations bonus densities, and other County programs which acquire or preserve open space areas. Section 19A.30.130, Objective 59B, sets forth policies on the management and stewardship of County-owned open space lands. Finally, 19D.170 identifies the County’s open space priorities grouped under high, medium, and low priorities.

The Pierce County Comprehensive Park, Recreation, and Open Space Plan (referred to as the Parks Plan) provides general direction and guidance for both facilities and programs.

Title 18A, Development Regulations-Zoning, Section 18A.35.025 contains standards for minimum residential amenities which include provisions for on-site open space areas. These standards require the dedication of open space land per dwelling unit for subdivisions and mobile home parks. Section 18A.35.050 addresses open space issues such as density incentives, open space location and designation criteria, permitted uses, classification mechanisms, and public access. Permitted uses within this designated open space include pervious and impervious surface trails, passive recreation and associated accessory structures, agricultural practices and associated structures, aquaculture, utility easements, and drainfields.

Different open space programs and development regulations lend themselves to protection and restoration of various designated open space areas. For example, when designated open space areas fall within the jurisdiction of the State’s Shoreline Management Act, the County’s Shoreline Management Use Regulations are in effect. Likewise, when an open space area is located within a designated critical area, which is often the case since the mapping was primarily based upon critical area information, the County’s Critical Area Regulations would apply. Outright purchase and other acquisition efforts, such as obtaining conservation easements, can be applied through the County’s Conservation Futures Program or local land trust efforts. Property owners may choose to leave portions of their properties in an undeveloped condition in return for a reduction in their property taxes under the Current Use Assessment (CUA) program. Pierce County Conservation District Stream Team efforts and
those of other local environmental organizations work to enhance and restore degraded riparian areas. Finally, the County’s zoning regulations require a dedication of open space for certain types of development.

**EXISTING PUBLICLY-OWNED OPEN SPACE SITES**

The Gig Harbor Peninsula Community Plan area contains several designated open space sites. The County Parks Department, utilizing Conservation Futures Program monies, purchased or is in the process of purchasing open space sites including Purdy B, Narrows Park, and the Homestead site.

**SIX YEAR CAPITAL FACILITIES PLAN FOR REGIONAL OPEN SPACE**

Currently the Countywide Level of Service (LOS) for Open Space (or Resource Conservancy Land) is 2.2 acres per 1,000 in population. The current LOS for Resource Conservancy land on the Gig Harbor Peninsula is 1.1 acres per 1,000 population. The estimated 2000 plan area population is 30,500. In the year 2017 the estimated plan area population will be approximately 52,000. If the 2017 population is used as a bench mark, 57.2 additional acres of Resource Conservancy land will be needed as compared to the Countywide LOS. (Note: these population projections are subject to change based upon annexation, new census data, etc.)

**DESCRIPTION OF DESIRED CONDITIONS**

The natural systems on the Gig Harbor Peninsula provide the citizens with the opportunity to live, work, and play in a healthy and scenic environment. The native vegetation and marine and fresh waters contribute to the livability of the area the residents treasure. Preserving the remaining fish and wildlife species and the native vegetation that provides the habitat for these species is important to the residents of the Gig Harbor Peninsula. Accommodating new growth while still maintaining the functions and values of the natural environment is a high priority. The following text describes the desired condition for each resource type in more detail.

**SHORELINES**

The natural features and critical functions of the marine and freshwater shoreline areas should be preserved and protected for present and future generations. Implementation of shoreline regulations should promote long-term values and goals above short-term interests. It is important that the Shoreline Master Program (SMP) classify the Peninsula area shorelines based on the natural shoreline processes, natural features, habitat value, and the criteria identified for shorelines of the state. Development standards along shorelines should ensure the preservation of native vegetation and wildlife habitat and protect water quality and natural shoreline processes. Low impact development tools should be considered for implementation. Additional public access and recreational opportunities at shoreline locations is a community priority and should be provided whenever possible.
**Surface Water**

Surface water should not negatively impact properties located downstream from development. Uncontrolled surface water can damage property, negatively impact the natural environment, and disturb salmon spawning areas. To minimize impacts associated with uncontrolled surface water runoff, including soil erosion, flooding, and stream scouring, it is imperative that new development be properly designed. Impervious surface should be limited to the greatest extent practical. Low impact development standards should be utilized, particularly on sites that contain critical areas, environmentally sensitive areas, and designated open space.

**Groundwater and Water Supply**

The Gig Harbor Peninsula faces potential water supply problems in the future. Groundwater supplies contained within the Gig Harbor Peninsula aquifer should be protected and conserved. Water conservation measures should be implemented when possible. The Gig Harbor Peninsula is susceptible to saltwater intrusion and several locations have shown evidence of some saltwater contamination. Water availability, water needs, and water conservation measures should be evaluated in each land use decision process. Land use and development decisions should be made with an emphasis on sustaining a long-term supply of high quality groundwater upon which the residents of the Gig Harbor Peninsula depend.

**Water Quality**

Pollutants and sediment are often carried to surface water bodies by stormwater runoff. Aquifers can be damaged by non-point sources of pollution or by simply not capping abandoned wells. Modifying the way certain types of land use activities are conducted can improve water quality standards. Agricultural practices should be modified to eliminate fecal coliform bacteria contamination into riparian areas. Forest practice activities that result in erosion and increased water temperatures should be avoided by providing adequate buffers. On-site sewage system requirements and practices that could potentially allow contamination of surface water and groundwater should be eliminated. Water quality can be protected for current and future generations through the control and elimination of non-point sources of pollution, implementation of Best Management Practices (BMPs), public education, voluntary stewardship, and resource conservation. These changes should be implemented to increase the quality of water within the plan area.

**Wetlands**

Protecting wetlands within the community is a major concern. Wetland systems should be preserved, enhanced, and restored within the plan area. Efforts to educate the public regarding the function, value, and importance of protecting wetlands should be pursued. An inventory of wetlands within the plan area should be completed. Wetlands that provide protection for federal or state listed endangered or threatened plant, fish, or animal species
should receive the greatest protection. In addition, any future development activities should be conducted in such a manner as to maintain the quality and function of the existing wetland complexes. Where feasible, wetland restoration activities should be undertaken to increase the healthy functioning of wetland systems which may have degraded as a result of development actions. A comprehensive review of wetland penalty and enforcement provisions should occur to determine if these provisions are adequate to serve as a deterrent to illegal wetland activities. Property owners who do have property that contains wetlands should continue to receive assurance that a reasonable use of the property will be allowed in the future. Transfer of development rights, purchase of development rights, tax reductions, and other types of incentive programs should all be explored as methods of compensation for properties that contain wetlands.

Fish and Wildlife

The existing fish and wildlife species contained within the plan area and the natural habitats that support these species should be protected and preserved. Pierce County should provide educational information on the existing fish and wildlife species located within the plan area and on Best Management Practices (BMPs) for retaining these species. Fish passage barriers in the streams within the plan area should be removed and steam that provide quality fish habitat should be preserved. Current riparian area buffer standards should be reviewed against the best available science and increased where existing standards do not adequately protect the functions and value of the aquatic ecosystem. Wildlife corridors that facilitate wildlife movement within the plan area should be protected. Areas containing trees that provide snags, nesting, and roosting sites for state or federally listed threatened or endangered bird populations should be protected. A prioritization list of habitat improvement projects for the plan area should be developed. The Critical Area regulations should be amended to establish riparian area buffers based on the best available science. Habitat Management Plans (HMPs) should be required for development projects in all sensitive resource designations (open space corridors) and development projects within the shoreline jurisdiction. Implementation of low impact development techniques should be explored as a method to stop the degradation of fish and wildlife habitat areas. Acquisition of the remaining high quality priority habitats within the plan area is a priority.

Open Space

Protection and preservation of the ecological features of the riparian corridors and near-shore environment that help to provide a high quality of life for the citizens that live throughout the Gig Harbor Peninsula is a community priority. The County-wide open space/greenbelt map should be amended to reflect the existing and desired system of open space within the community for future generations. Open space areas that provide quality fish and wildlife habitat should be preserved and restored. Public and private acquisition, preservation, and restoration efforts within the designated open space areas should be pursued through cooperative agreements and public education and outreach efforts. Open space acquisition efforts should focus on land targeted by the community. These sites are described as high
priority open space acquisition areas. Development within designated open space areas should be limited through established density and intensity levels, appropriate uses, and low impact development techniques. Open space dedications should continue to be a development incentive option that can be used to increase the density or intensity of a project site. Native buffer areas, vegetative screens, and greenbelts should be incorporated into the overall system of open space in order to soften impacts of development, provide opportunities for trails, create opportunities for pocket parks, and promote design that is consistent with community established standards as well as providing fish and wildlife habitat. See Map E-4: Open Space Corridors.

**Environment Policies**

**Goals**

The various natural systems, critical areas, and resource lands on the Gig Harbor Peninsula provide residents the opportunity to live, work, and play in a healthy environment. The function and value of these features which contribute to the scenic beauty and livability of the area should be maintained, protected, and enhanced for the enjoyment and use of present and future generations. Protect and conserve all elements of the natural environment on the Gig Harbor Peninsula, including fish and wildlife habitat, native vegetation, aquifer recharge areas, lakes, streams, wetlands, steep slopes, and marine shorelines by carefully controlling growth and limiting development in sensitive ecosystems.

**Shorelines**

**Goal GH ENV-1** Marine and freshwater shorelines have historically contributed to the economic, recreational, and cultural identity of the Gig Harbor Peninsula. Because of the high quality of life that is offered by living and working near the water, these shoreline areas have received some of the greatest development pressures within the community plan area. It is important that the natural features and critical functions of the marine and freshwater shoreline areas be preserved and protected for present and future generations. The natural character and ecology of the shoreline environment should be preserved. Land use policy should promote long-term values and goals above short-term interests.

**GH ENV-1.1** Ensure that the Shoreline Master Program (SMP) accurately identifies and classifies all marine shorelines and freshwater lakes and streams in the Gig Harbor Peninsula plan area based on shoreline processes, natural features, and habitat value.
GH ENV-1.2 Develop a detailed inventory of shoreline conditions within the plan area, including the number, type, and location of shoreline armoring projects, stairs, docks, and piers. The survey should also include public access points, marinas, stormwater discharge points, and potential septic system failures. Valuable habitat areas, such as eelgrass beds and baitfish spawning areas, should also be included. The shoreline inventory should be integrated into the County Geographic Information System (GIS).

GH ENV-1.3 Revise the SMP to reflect shoreline environmental designations that accurately represent current conditions of the shorelines, the scientific understanding of shoreline processes, and the community's attitudes toward shoreline management.

GH ENV-1.3.1 Sites with environmental constraints, recreational land, and properties for which a land trust has an interest through ownership, easement, or other binding agreement should be designated as Conservancy.

GH ENV-1.3.2 Unique features such as sand spits, estuaries, and marine feeder bluffs should receive a Natural designation.

GOAL GH ENV-2 Development standards along shorelines should ensure the preservation of native vegetation and wildlife habitat and protect water quality and natural shoreline processes.

GH ENV-2.1 Consider implementing low impact development tools. These include reducing the amount of impervious surfaces on each site, minimizing soil disturbance and erosion, disconnecting constructed drainage courses, and utilizing micro-detention facilities on each lot, (provided such facilities would not contribute to landslide hazards or slope failures) where feasible, rather than one facility at the end of a conveyance system.

GH ENV-2.2 Require a tree canopy and native vegetation buffer plan for new development in all shoreline environments.

GH ENV-2.2.1 Discourage lawn areas that extend to the edge of slopes, bluffs, or beaches. Encourage retention of native vegetation immediately adjacent to the waterbody in any required setback.

GH ENV-2.2.2 Require protection for trees, including snags, located along the shoreline.

GH ENV-2.3 Allow new bulkheads and other hard armoring structures along shorelines only when it is demonstrated that beach nourishment or other bioengineering soft armoring techniques would likely be ineffective.

GH ENV-2.3.1 Authorize new and replacement bulkheads only when accessory to an existing residential dwelling that is in imminent danger of damage caused by beach erosion and only after alternative techniques are determined to be unsuitable.
GH ENV-2.3.2 Authorize new and replacement bulkheads for other non-water-dependent uses only when an existing structure is in imminent danger of damage caused by beach erosion, and alternative techniques have been ruled out.

GH ENV-2.3.3 Construct non-water-dependent structures (including single-family residences) along the shoreline at a sufficient distance from the shoreline to ensure that bulkheads are not necessary for the lifetime of the structure.

GH ENV-2.3.4 Prohibit new bulkheads on vacant parcels and below feeder bluffs.

GH ENV-2.3.5 Establish a tracking system for bulkheads and other shoreline armoring projects that would allow the continued tracking of these structures while facilitating a more consistent review process.

GH ENV-2.4 Base allowable uses along the shoreline on the Comprehensive Plan land use designation and SMP and permit them on a case by case basis.

GH ENV-2.4.1 Analyze the cumulative impacts of shoreline development when evaluating an individual project.

GH ENV-2.4.2 The Hearing Examiner may approve a specific land use through a site plan review process based on the unique characteristics of each site.

GH ENV-2.4.3 Permit outright or administratively detached single-family residential homes and associated accessory structures when located outside of the defined shoreline setback.

GH ENV-2.4.4 Generally prohibit new construction or any expansion of an existing structure over the water (e.g., boathouses shall be located landward of the ordinary high water mark).

GH ENV-2.5 Base residential densities on a particular site on the densities described in the Development Regulations in the Pierce County Code.

GH ENV-2.6 Strictly control requests to obtain variances from development standards along the shoreline. Grant variances only in extraordinary circumstances relating to the physical character or configuration of the building lot.

GH ENV-2.7 Prioritize vegetation and tree preservation in shoreline locations that are identified on the Open Space Corridors Map.

GH ENV-2.7.1 Encourage retention of native vegetation and trees immediately adjacent to the waterbody in any required setback.

GOAL GH ENV-3 Promote education, awareness, and outreach programs that emphasize best management practices (BMPs) and environmental stewardship for waterfront property owners.

GH ENV-3.1 Discourage the use of fertilizers and pesticides on lawns in shoreline areas. Offer educational information to residents on environmentally friendly, non-chemical alternatives.
GH ENV-3.2  To discourage erosion, encourage limbing or pruning trees for view enhancement instead of removing an entire tree. Remove tree stumps on a case by case basis.

GH ENV-3.3  Increase awareness and enforcement of SMP rules to prevent the loss of wildlife habitat.

GH ENV-3.4  To help control surface water runoff, discourage vegetation removal during construction and site development activity.

GH ENV-3.5  Encourage homeowners to reduce the amount of water entering the ground or running across the surface at high or medium bank locations. Screen drainage pipes from view along marine bluffs whenever possible.

GH ENV-3.6  Provide a list of bulkhead design options that encourage alternatives to traditional concrete, rock, or timber bulkheads. Examples include beach nourishment and soft armoring techniques such as adding drift logs and bioengineering measures that include proper groundwater and vegetation management.

GOAL GH ENV-4  Encourage shoreline restoration activities that increase the function and value of the nearshore environment.

GH ENV-4.1  Require a habitat restoration plan for shorelines on those sites that have existing shoreline violations prior to any permit approval.

GH ENV-4.2  Encourage the removal of bulkheads and other hard armoring along marine waters where it would improve fish habitat.

GH ENV-4.3  Promote the voluntary retention and replanting of native vegetation along lakes, streams, and marine waters.

GOAL GH ENV-5  Promote coordination between Pierce County and other agencies, such as the City of Gig Harbor, Army Corps of Engineers, and state agencies such as the Departments of Ecology, Fish and Wildlife, and Natural Resources, that have an interest in shoreline issues.

GH ENV-5.1  Coordinate with other agencies in the development of an inventory of shoreline conditions within the plan area.

GH ENV-5.2  Provide additional County resources to monitor the health of the nearshore environment and to enforce shoreline violations.

GH ENV-5.3  Consider monitoring shoreline areas for environmental degradation and SMP violations.

GOAL GH ENV-6  Increase recreational opportunities at existing shoreline access points and promote additional public access to shoreline locations.

GH ENV-6.1  Encourage acquisition of shoreline access points that provide opportunities for boat launches, public docks or piers, beach walking, wildlife viewing, and other shoreline-dependent uses. Protect public rights to access beaches, shorelands, tidelands, and associated waterbodies.
GH ENV-6.2  Prohibit the vacation or trading of unopened public rights-of-way at shoreline locations, except when the vacation or trade would enable a public authority to acquire the vacated property for public purposes.

GH ENV-6.3  Actively pursue public access to marine and fresh waters to provide non-waterfront neighborhoods and the general public permanent access to those waters.

GH ENV-6.4  Promote development of public and private pedestrian access to shorelands and tidelands. Property owners that provide public access to marine waters may be eligible for a property tax reduction.

GH ENV-6.5  Access and use of public beaches and state-owned tidelands in front of private waterfront properties is permitted and encouraged. Maintain mitigation of impacts (e.g., trash receptacles, buffering) to adjacent property owners at shoreline access points.

GH ENV-6.6  Include public easements dedicating access to designated public waterfront areas as part of private upland development projects prior to site development.

GH ENV-6.7  Encourage signs that provide the general public with directions to the various public shoreline access locations in the plan area.

**Surface Water**

**GOAL GH ENV-7**  Apply low impact development (LID) standards on properties designated as Rural Sensitive Resource or with the Urban Sensitive Resource Overlay, critical areas, designated open space areas, and proposed new developments on County-owned properties.

GH ENV-7.1  Require property owners to conduct a geotechnical evaluation of properties that contain landslide and erosion hazard areas prior to clearing or site development. This geotechnical report shall recommend stormwater runoff options prior to construction of a stormwater system.

GH ENV-7.2  Require a conceptual stormwater drainage plan for any of the following projects when subject to review by the Peninsula Advisory Commission (PAC):

GH ENV-7.2.1  All development projects, except for an individual single-family residence, on sites that are 3 acres in size or greater;

GH ENV-7.2.2  Commercial, civic, or industrial development in the Rural Sensitive Resource and Urban Sensitive Resource Overlay designations;

GH ENV-7.2.3  Residential subdivisions in the Rural Sensitive Resource and Urban Sensitive Resource Overlay designations;

GH ENV-7.2.4  Residential developments at a density of 4 dwelling units per acre or greater;

GH ENV-7.2.5  Any residential subdivision of land into 20 or more lots;
GH ENV-7.2.6 Buildings that exceed 8,000 square feet; and
GH ENV-7.2.7 Projects that create 50% or more impervious surfaces on a site.

GH ENV-7.3 Submit the conceptual stormwater drainage plan prior to the PAC hearing. A conceptual stormwater plan shall contain the following information to determine if the proposal is likely to meet the stormwater development standards:

GH ENV-7.3.1 An analysis of how runoff will functionally relate to the finished project;
GH ENV-7.3.2 An evaluation of the soils on the project site;
GH ENV-7.3.3 A discussion of the proposed type of stormwater control facility; and
GH ENV-7.3.4 An analysis of existing drainage patterns and existing drainage problems in the vicinity and downstream of the project site.

GH ENV-7.4 Regulate the filling or modification of surface waters and natural stormwater retention areas.
GH ENV-7.4.1 Prohibit filling or modifications that decrease or detrimentally affect the existing water levels and water storage capacity within perennial and intermittent streams, ponds, or wetlands.
GH ENV-7.4.2 Address the cumulative impacts of the decrease in natural water retention areas by the filling of potholes located on or contiguous with several separate parcels. Provide an analysis which identifies how this water will be retained elsewhere on site. Notify affected adjacent property owners.

GROUNDWATER

GOAL GH ENV-8 The Gig Harbor Peninsula is completely dependent on local groundwater for supply. Groundwater quality and supply are generally good throughout the Peninsula; however, the area is susceptible to saltwater intrusion and several locations have shown evidence of some saltwater contamination. Evaluate water availability, water needs, and water conservation measures in each land use decision process.

GH ENV-8.1 Institute minimum natural vegetation retention requirements that provide areas for infiltration of surface water and groundwater recharge to occur. Such requirements should be complimentary to vegetation retention requirements for other objectives of the Natural Environment and Open Space Element.

GH ENV-8.2 Encourage a reduction in the amount of irrigation that occurs on grass or landscape vegetation that has been installed over soils that have been scraped of the organic layer.

GH ENV-8.3 Encourage drip irrigation systems and promote water conservation methods for lawn watering (e.g., even-numbered houses would water on even-numbered days, promote conservation pricing measures, etc.).

GH ENV-8.4 Discourage extensive, irrigated landscape areas in new developments.
GH ENV-8.5 Pierce County should work with the Tacoma-Pierce County Health Department to install signage around the perimeter of wellhead protection areas and the most sensitive aquifer recharge areas.

GH ENV-8.6 Identify and protect aquifer recharge areas throughout the Peninsula through the Kitsap Basin (Water Research Inventory Area #15) planning effort.

GH ENV-8.6.1 Assess streams and develop habitat improvement projects.

GH ENV-8.6.2 Identify potential restoration areas through the Gig Harbor Peninsula Basin planning effort.

GH ENV-8.6.3 Work with existing volunteer groups, such as the Pierce County Conservation District Stream Team, to provide restoration actions on identified sites.

GH ENV-8.6.4 Provide a long-term forum for addressing water quality issues within the plan area using the current Key Peninsula-Gig Harbor-Islands (KGI) Watershed Committee or a similar organization.

GH ENV-8.6.5 Establish shellfish protection districts in areas that are affected by a shellfish downgrade to indicate a commitment to restore shellfish harvesting within the area.

GH ENV-8.7 Require that new marinas and remodels of existing marina facilities be outfitted with appropriate waste disposal facilities such as fixed or floating pumpout or dump stations. Require that public boat ramp facilities be equipped with dump stations for boaters’ portable toilets.

GH ENV-8.7.1 Require portable toilets or permanent restroom facilities and refuse containers to be located at all public boat launch locations.

WETLANDS

GOAL GH ENV-9 Require the evaluation and mitigation of the potential impacts of stormwater runoff on wetland hydroperiods when it is determined that a development project will contribute runoff to the wetland.

GH ENV-9.1 Encourage restoration of wetlands that have been degraded as a result of previous development actions within the plan area.

GH ENV-9.1.1 Pursue grants and other funding sources that could be used to restore important wetland systems that were degraded.

GH ENV-9.1.2 Promote programs that involve volunteer efforts to clean up and repair the function and value of damaged wetlands.

GH ENV-9.2 Promote and encourage direct acquisition or conservation easements at important wetland areas within the plan area, such as Winchester Swamp.
**FISH AND WILDLIFE**

**GOAL GH ENV-10**  Preserve the existing fish and wildlife species contained within the plan area and the natural habitats that support these species. Provide additional education to other agencies and to the general public on the existing fish and wildlife species located within the plan area and on best management practices (BMPs) for retaining these species. Facilitate fish passage in the creeks and streams located within the plan area.

**GH ENV-10.1**  Implement the Rural Sensitive Resource and Urban Sensitive Resource Overlay designations within Biodiversity Management Areas (BMA) and wildlife corridors.

**GH ENV-10.2**  Include BMAs and wildlife corridors as habitats of local importance in the Fish and Wildlife chapter of the Critical Areas Regulations.

**GH ENV-10.2.1**  Establish buffers that are sized according to the best available science. Buffers should be located around important features, such as heron rookeries.

**GH ENV-10.2.2**  Restrict construction activities (e.g., loud noises) that could disturb birds during nesting periods.

**GH ENV-10.3**  Require that the location of all designated riparian area buffers be clearly and permanently marked as a native growth protection area with appropriate signage on any project site prior to initiation of site work.

**GH ENV-10.4**  Require that all designated riparian area buffers be reserved as open space and identified as native growth protection areas on the face of the plat and as a deed restriction on the property. Native growth protection easements for buffers should be established and recorded as part of the approval process.

**GH ENV-10.4.1**  Require a predevelopment habitat inventory for the project site (including riparian and terrestrial habitat). The habitat inventory will provide information regarding the types of species that could be expected to live within a given environment.

**GH ENV-10.5**  Require a permit for development of ponds for farm uses, fish propagation, and wildlife or waterfowl habitat that are contiguous to wetlands, lakes, ponds, or streams. Permit such uses only if the natural drainage pattern is not adversely altered.

**GH ENV-10.5.1**  Prohibit channeling, riprapping, diking, or other stream bank stabilization methods that detrimentally increase stream flow or adversely impact the stream’s existing characteristics in any other way.

**OPEN SPACE**

Identify a system of open space corridors within the Gig Harbor Peninsula Community Plan area that serves to refine the adopted Countywide Open Space Corridors Map. Foster preservation, restoration, and enhancement of these areas that are designated as open space. Identify
implementation strategies to preserve the critical features and functions of these natural areas for future generations.

Continue to protect and preserve the ecological features of the riparian corridors and nearshore environment that help to provide a high quality of life for the citizens that live throughout the Gig Harbor Peninsula. Refine the Countywide Open Space Corridors Map to reflect the existing and desired system of open space within the community for future generations. Strive to create and enhance open space corridors along important fish and wildlife habitat locations that provide a healthy ecosystem and pleasing scenery. Identify and prioritize properties within the designated open space system for acquisition and access opportunities. Promote public and private acquisition, preservation, and restoration efforts within the designated open space areas through cooperative agreements and public education and outreach efforts. Permit limited development within designated open space areas through established density and intensity levels, appropriate uses, and low impact development techniques.

GOAL GH ENV-11  The Countywide Open Space Corridors Map identifies those areas that are the highest priority for open space preservation and enhancement. Refine the Countywide Open Space Corridors Map for the Gig Harbor Peninsula Community Plan area based on a detailed analysis of the high priority resource categories and existing development patterns on the Peninsula.

GH ENV-11.1 Identify other important areas in the community that may be located outside of the designated open space system for potential open space acquisition.

GH ENV-11.2 Consider acquiring a significant portion of the properties that are referred to as Crescent Ridge Trails for open space purposes.

GH ENV-11.3 In a rapidly developing area like the Gig Harbor Peninsula, it is important to acquire land for open space before sites become cost prohibitive.

GH ENV-11.4 Properties that are not identified on the adopted Open Space Corridors Map may be considered for public funding if the site contains high priority resources as listed in Pierce County Code, Chapter 2.114.

GOAL GH ENV-12  Encourage restoration activities that enhance the function and value of the fish and wildlife habitat ecosystems contained within the open space network.

GOAL GH ENV-13  Coordinate with the City of Gig Harbor, other agencies, and nonprofit organizations that have an interest in preserving or enhancing open space within the plan area.

GH ENV-13.1 Coordinate open space planning in the Urban Growth Area with the City of Gig Harbor.

GH ENV-13.2 Pierce County should work with the City of Gig Harbor to promote performance standards for new development within designated open space areas.

GH ENV-13.3 Carefully control development activities in the Urban Growth Area on sites that have been identified as open space in the Comprehensive Plan Open Space Corridors Map through implementation of an Urban Sensitive Resource Overlay.
GH ENV-13.4 Utilize the Gig Harbor Peninsula Community Plan open space policies when evaluating the potential environmental impacts of projects that are proposed within designated open space corridors.

GOAL GH ENV-14 The goal for native vegetation coverage shall be 75% within the Urban Sensitive Resource Overlay and the Rural Sensitive Resource zone to implement the Peninsula Open Space Corridors map.

IMPLEMENTING ACTIONS

The following is a list of actions that needs to be completed in order to implement the policies contained within the Natural Environment and Open Space Element. They are arranged according to the timeframe within which each should be completed: short, medium, or long term. Short term actions should occur immediately or within one year of plan adoption. Mid-term actions should be completed within 1-5 years. Long term actions should be completed within 5-10 years of plan adoption. The party or parties responsible for leading the effort to complete the action item are listed in parenthesis following the action. Actions are assigned to the Gig Harbor Peninsula Community Planning Board (GHPCPB), the Peninsula Advisory Commission (PAC), or Pierce County Planning and Land Services (PALS). Those actions assigned to the GHPCPB are completed as part of the adoption and implementation of this plan.

SHORT TERM ACTIONS

1. Amend the County’s Site Development and Stormwater Management Regulations. (PALS, PWU)
   • Develop and adopt Low Impact Development (LID) standards and guidelines.
   • Provide for better enforcement and maintenance of storm drainage systems.

2. Amend the County’s Shoreline Master Program. (PALS, PWU, PAC, CORPS, DOE)
   • Develop a detailed inventory of shoreline conditions within the plan area, including the number, type, and location of shoreline armoring projects, stairs, docks, and piers.
   • Integrate the shoreline inventory into the County Geographic Information System.

3. Amend the County Critical Area Regulations. (PALS, PAC, TPCHD, WDOE, WDFW)
   • Develop and adopt Low Impact Development (LID) standards and guidelines.
   • Develop standards to reduce transport of commonly used household hazardous chemicals, fertilizers, pesticides, and pet wastes into adjacent lakes, streams, and wetlands.
   • Protect areas containing trees that provide snags, nesting, and roosting sites for state or federally listed threatened or endangered bird populations.
   • Provide greater protection for those wetlands that are inhabited or utilized by federal or state listed endangered or threatened plant, fish, or animal species.
• Increase the percentage of native vegetation within designated fish and wildlife habitat areas identified in the plan area.
• Require that new vegetation plantings are native, non-invasive species within designated fish and wildlife habitat areas.
• Implement low impact development techniques within Biodiversity Management Areas (BMAs) and wildlife corridors.

4. Amend the County Development Regulations-Zoning. (PALS, PAC, PWU)
   • Require a conceptual stormwater drainage plan prior to the Peninsula Advisory Commission (PAC) review of major developments or projects on sensitive sites.
   • Review existing allowable limits of impervious surface against the best available science to determine if these standards are adequate.
   • Examine existing parking lot standards for ways to reduce the total amount of effective impervious surface.

5. Pursue programs that protect and conserve groundwater supplies contained within the Gig Harbor Peninsula aquifer. (PALS, TPCHD, DOE)
   • Implement water conservation measures throughout the plan area.

6. Work with the TPCHD and the Department of Emergency Management to enhance hazardous spill response coordination within the plan area. (PALS, TPCHD, DEM)
   • Work with Pierce County’s Emergency Management Department to identify appropriate methods for handling spill response in high-risk areas.
   • Initiate a program to install signage around the perimeter of wellhead protection areas and the most sensitive aquifer recharge areas.
   • Pursue funding opportunities to map spill locations on state routes for areas that have a potential to enter the one-year time of travel zone and/or storm drainage systems.

7. Implement a variety of strategies within the plan area that encourage public and private organizations to acquire, retain and preserve open space. (PALS, Parks, Peninsula Land Trust, PCCD, WSU)
   • Pursue open space acquisition opportunities through the Pierce County Conservation Futures Program.
   • Support the ongoing efforts of Land Trusts and similar non-profit organizations that work to preserve open space.
   • Develop and adopt a Purchase of Development Rights (PDR) and the Transfer of Development Rights (TDR) program.
   • Conduct workshops on the County’s Current Use Assessment (CUA) Public Benefit Rating System (PBRS).
   • Coordinate with the Pierce County Conservation District, the Washington State University-Pierce County Cooperative Extension Office and other government agencies in their efforts to educate property owners within the open space network on best management practices, native vegetation planting, and habitat restoration.
• Support the volunteer efforts of private organizations that are involved in habitat restoration activities on the Peninsula.
• Streamline the regulatory permitting process for habitat restoration projects.
• Encourage restoration activities that enhance the function and value of the fish and wildlife habitat ecosystems contained within the open space network.

8. Maintain the level of service standard for open space on the Gig Harbor Peninsula as identified in the Pierce County Comprehensive Plan. (County Council, Parks)

9. Review all penalties and enforcement language in the Pierce County land use codes to determine if the provisions are adequate to deter illegal activities. (PALS, PWU, TPCHD)

**MID-TERM ACTIONS**

1. Amend the County’s Site Development and Stormwater Management Regulations. (PALS, PWU)
   • Develop a monitoring program to evaluate projects that utilize LID standards to determine the effectiveness of the established goals.

2. Amend the County’s Shoreline Master Program. (PALS, PWU, PAC, WDOE)
   • Develop and adopt Low Impact Development (LID) techniques along all Peninsula area shorelines.
   • Require a tree canopy and native vegetation buffer plan for new development in all shoreline environments.
   • Update siting criteria and construction standards for bulkheads, piers, and docks.
   • Classify shoreline environmental designations that accurately represent current conditions of the shorelines, the scientific understanding of shoreline processes, and the community's attitudes toward shoreline management.
   • Require Habitat Management Plans (HMPs) for development within the Shoreline jurisdiction.
   • Conduct stream flow testing and review other current information to determine if Peninsula area creeks meet the minimum flow criteria for shorelines of the state.

3. Amend the County Critical Area Regulations. (PALS, PAC, TPCHD, WDOE, WDFW, CORPS)
   • Develop an incentive program that provides flexibility for protecting wetlands that are contained in fish and wildlife habitat management zones.
   • Establish fish and wildlife habitat buffers that are sized according to the best available science.
   • Include BMAs and wildlife corridors as habitats of local importance in the Fish and Wildlife Chapter of the Critical Areas Regulations.
   • Conduct detailed inventory of wetland complexes located within the plan area.
   • Develop a Transfer of Development Rights and Purchase of Development Rights program for wetland area density transfers.
   • Develop a wetland banking program.
• Implement adaptive management techniques for protecting critical areas as new information becomes available.
• Develop marine bluff standards to address development along the saltwater shorelines.

4. Amend the County Development Regulations-Zoning. (PALS, PAC, PWU)
• Require a conceptual stormwater drainage plan prior to the Peninsula Advisory Commission (PAC) review of major developments or projects on sensitive sites.
• Review existing allowable limits of impervious surface against the best available science to determine if these standards should be reduced.
• Examine existing parking lot standards for ways to reduce the total amount of effective impervious surface.

5. Amend the Pierce County Environmental Regulations and PALS administrative Procedures. (PALS, PWU)
• Develop a process for the preparation of Environmental Impact Statements (EISs) by an independent third party.
• Require additional pollution control measures at boat launches and other public shoreline access locations that lack appropriate facilities.

6. Provide additional County resources to monitor the health of the near-shore environment and to enforce violations. (PALS, TPCHD)
• Fund at least one additional staff person committed to shoreline management regulation and enforcement in the plan area.
• Consider adding provisions for property liens on parcels that are in violation of the SMP.
• Consider monitoring shoreline areas for environmental degradation and SMP violations.
• Promote education, awareness, and outreach programs that emphasize best management practices (BMPs) and environmental stewardship for waterfront property owners.
• Provide additional education to property owners along streams, lakes, and marine waters on the existing fish and wildlife species and habitat needs.

7. Implement strategies to improve water quality within the Gig Harbor Peninsula Community Plan area. (PALS, PWU, TPCHD, WDFW, PCCD)
• Review existing regulations and County programs to identify potential impacts on water quality and implement improvements to help eliminate non-point source discharges that detrimentally affect water quality.
• Require BMPs for agricultural activities.
• Restrict livestock access to riparian and wetland areas.
• Condition Forest Practice and road construction approvals to eliminate erosion and transport of sedimentation into lakes, streams, and wetlands.
• Develop partnership opportunities with Washington State University-Pierce County Cooperative Extension Office and Pierce County Conservation District to conduct public education and outreach efforts within the plan area that are geared toward reducing the impacts to water quality associated with household activities or property management.
• Implement adaptive management techniques for protecting water resources as new information becomes available.

8. Monitor streams, lakes, and marine shorelines within the plan area for compliance with quality standards and impacts related to development. (PALS, TPCHD, DOE, DFW, CORPS)
  • Establish volunteer groups and contact community organizations that are interested in water quality programs such as the Pierce County Stream Team.
  • Monitor wetlands for impacts related to development.

9. Inventory existing environmental conditions and features within the plan area. (PALS, PWU, WDFW, PCCD)
  • Evaluate streams within the plan area for evidence of scouring, erosion, increases in peak stormwater flows and velocities, or a reduction in biological activity.
  • Participate with the WDFW in a habitat survey of the plan area that includes an inventory of habitat types and their conditions.

10. Encourage shoreline restoration activities that increase the function and value of the shoreline environment. (PALS, WDOE, WDFW, PCCD)
  • Develop a prioritization list of habitat improvement projects for the plan area.
  • Cooperate with the WDFW and waterfront property owners in the development of any showcase habitat restoration projects.
  • Promote backyard wildlife sanctuary programs.
  • Establish shellfish protection districts in areas that are affected by a shellfish downgrade.
  • Utilize the results of the Pierce County Conservation District’s (PCCD) survey of fish passage barriers that has been prepared for the community plan area and prioritize correction of any blockages in the next Capital Improvement Program (CIP) update.

11. Pursue the restoration, acquisition, and preservation of open space areas in the community. (PALS, City of Gig Harbor, PCCD, Peninsula Land Trust, Parks, CORPS, WDOE, WDFW)
  • Coordinate with the City of Gig Harbor, other agencies, and non-profit organizations that have an interest in preserving or enhancing open space within the plan area.
  • Utilize countywide impact fees to purchase open space land.
  • Conduct public workshops on the County’s Current Use Assessment Program, Public Benefit Rating System (tax reduction) to encourage property owners to place wetlands into open space designations.
• Pursue grants and other funding sources that could be used to restore important wetland systems that were degraded prior to adoption of the Wetland Management Regulations.
• Promote programs that involve volunteer efforts to clean up and repair the function and value of damaged wetlands.

12. Initiate a public vote on a measure that would levy a real estate excise tax on real estate transactions for the purpose of acquiring and maintaining conservation areas.

**LONG TERM ACTIONS**

1. Establish a long-term forum for addressing water quality issues within the plan area using the current Key Peninsula-Gig Harbor-Islands (KGI) Watershed Committee or a similar organization. (PALS, KGI, TPCHD)
2. Develop a long-term public education, outreach, and incentive program for preserving and protecting Critical Areas. (PALS, Parks, KGI, PWU, WDOE, WDFW)
   • Work with local environmental groups such as the Peninsula Neighborhood Association, Tahoma Audubon Society, etc. to develop a workshop on identifying and protecting critical within the plan area.
   • Work with the Pierce County Conservation District and Washington State University-Pierce County Cooperative Extension Office to provide additional public education and outreach for preserving critical within the plan area.
   • Promote and encourage direct acquisition or conservation easements at important critical areas within the plan area.
Chapter 5: Economic Element

Introduction

The Economic Element of the Gig Harbor Peninsula Community Plan recognizes that the natural resources and amenities of the Peninsula are in fact those features which make it a desirable place for people to live, work, and play. Protection of these resources is paramount if the quality of life is to be maintained for both existing and future residents. Throughout the community plan, development is required to respect these resources and amenities, since poor development or over development could very easily destroy the values that enrich the community. While certain types of economic development are encouraged, the citizens and business interests do not want development to come at the expense of the natural environment.

The Gig Harbor Peninsula historically developed on commercial fishing, sport fishing, agriculture, and forestry. Today the Peninsula continues to have a relatively high concentration of employment in these sectors compared to the rest of Pierce County, but the economy has diversified away from resource-based industries to professional services and retail trade. Today the majority of citizens commute across the Narrows Bridge for employment.

The people of the Gig Harbor Peninsula recognize the geographic constraints of where they live and accept the reality that the Peninsula is not an ideal location for manufacturing opportunities. The difficulties stem from the need to cross Puget Sound via the Narrows and the lack of a deep water port in the Gig Harbor area. Industries involving significant importing and exporting of goods via truck or ship would not operate cost effectively.

In the next twenty years, the citizens would like to see less reliance on the Tacoma Narrows Bridge by providing more civic and commercial services on the Peninsula. Currently, the majority of services are available east of the Narrows Bridge. Some services are also available north of Gig Harbor in Kitsap County. As the population increases and the difficulty of crossing the bridge increases, the community plan looks for more services to be provided within the City of Gig Harbor and its Urban Growth Area. The policies within the Economic Element recognize the types of businesses that are desired on the Peninsula. These additional businesses and services are to be located within the city limits or within the Urban Growth Area.

Local ownership and the opportunity for new startup companies and home businesses are also important to the Peninsula. Local citizens and families presently own many of the successful businesses on the Peninsula. Plan policies call for the continuation of this trend through recognition and allowance of home occupations, cottage industries, and small entrepreneurs.

The Tacoma Narrows Airport is expected to continue to support aviation related industries. The airport is located in the rural area and therefore would not be served by urban facilities and infrastructure. The airport is not expected to substantially increase employment opportunities and is not intended to be an employment base.
Description of Current Conditions

Residents of the Gig Harbor Peninsula are comfortable with many of the economic changes that have occurred within their community over the past two decades. They enjoy the fact that the community has experienced some growth but that the natural environment is largely still intact. The 1975 Gig Harbor Peninsula Community Plan helped to balance economic growth with conservation of the natural environment.

The people of the Gig Harbor Peninsula and Fox Island are not willing to compromise the natural resources, shorelines, and environment for economic growth. They treasure the natural beauty and rural character of the area and want future generations to continue to enjoy it as well.

Work Force

The Gig Harbor work force is considerably more well-educated than the Pierce County work force as a whole. Based on information from the 1990 census, the area has only 1/3 the concentration of people with an 8th grade or lower education, and nearly twice the concentration of people with graduate or professional degrees compared to the rest of Pierce County. The relatively higher levels of education found in the Gig Harbor work force is reflected in the occupations of area residents. Table E-10 shows that, relative to the overall Pierce County work force, the Gig Harbor work force is heavily concentrated in executive, administrative and managerial, professional specialty, and sales positions. Many of the professional occupations are located east of the Tacoma Narrows Bridge and residents commute to employment locations.

Source: U.S. Census, 1990
Conversely, there is a low percentage of skilled laborers from the Gig Harbor Peninsula. The workforce is underrepresented in private household services, machine operators, and miscellaneous helpers and laborers. There are also a lower number of military employees in Gig Harbor than the rest of the County.

**Industry and Employment**

Employment located in the Gig Harbor area is heavily concentrated in the retail trade and services sectors, with nearly 68% of all employment in those two sectors. The services sector in Gig Harbor is dominated by professional services, with 43% of the firms providing medical, consulting, education, or legal services. The economic policies within this element support the continuation of this trend in professional services.

Table E-11 shows employment concentrations in Gig Harbor compared to Washington State and Pierce County. The location quotients in Table E-11 indicate concentrations of employment types. A location quotient greater than 1 indicates an industry sector with a higher concentration of employees than the rest of the County or Washington State. Similarly, a location quotient of less than 1 indicates a low concentration sector. Sectors with relatively higher concentrations of employment suggest that the area has some kind of comparative advantage for that sector.

Source: Washington State Employment Security Department; Pierce County Dept of Community Services

As indicated in the table, the industry with the lowest location quotient is manufacturing. This information is expected due to geographic constraints of the Peninsula, which result in additional shipping costs to transport goods to/from the Peninsula.
Statistics from the Washington State Employment Security Department for zip codes 98332 and 98335 show that 47% of firms in the Gig Harbor area have 1-4 employees and another 20% report no employees. Together, this 67% of firms represents approximately 13% of the area’s employment and provides about 12% of the area’s wages. Two firms employ 500 people or more and account for 20% of the employment and 19% of the wages paid in the area. Firms that employ between 5-99 people make up 32% of all firms and provide 56% of the area’s employment and 55% of the wages.

Data from the Washington State Department of Revenue shows the number of firms reporting gross business income from the Gig Harbor Peninsula increased by 31% between 1989 and 1999, with the greatest increase coming in the 1992 through 1996 period. Taxable retail sales increased during that time by 105%, with most of the gain coming in the period of 1997 through 1999.

**Table E-12: Taxable Retail Sales**

Source: Washington State Dept. of Revenue; Pierce County Dept. of Community Services
DESCRIPTION OF DESIRED CONDITIONS

The residents of the Peninsula are satisfied with the current economy. Conservation of the natural environment remains a priority and the citizens do not wish to see rampant economic development. However, there are a few more amenities they would like to see brought to their community.

Over the course of the twenty years of this community plan, the citizens would like more commercial, civic, and professional businesses brought to their community as a means of reducing reliance on the Tacoma Narrows Bridge. As services and professional opportunities are located on the Peninsula, fewer residents will travel across the bridge for these items. Retail services such as clothing stores, home furnishings, and restaurants are desired. The citizens would like services to be available as growth occurs.

The Economic Element policies also recognize the need for a hospital or a health care related facility. Such facilities would reduce the need for Peninsula residents to travel to Tacoma for emergencies or maintenance health care. The policies also support the continuation and potential expansion of higher education facilities in the community.

Finally, the residents and business owners of the Peninsula would like better coordination between the City of Gig Harbor and Pierce County. This coordination would allow greater consistency with land use issues and further the economic goals of both the city and County.

ECONOMIC DEVELOPMENT POLICIES

GOALS

Encourage economic development that is responsive to the needs of the community and is contained within the City of Gig Harbor's Urban Growth Area (UGA) or a Rural Neighborhood Center. Economic development should provide the community with a desirable balance of employment and economic return with its impact, provided that new economic development shall not significantly contribute to light, noise, water, air, or land pollution.

Finally, the residents and business owners of the Peninsula would like better coordination between the City of Gig Harbor and Pierce County. This coordination would allow greater consistency with land use issues and further the economic goals of both the city and County.

ECONOMIC DEVELOPMENT

GOAL GH EC-1 Encourage the establishment and protection of the small entrepreneurs who provide the Peninsula with much of its character and diversity.

GH EC-1.1 Provide basic commercial services which are scaled in size and number to the needs of Peninsula residents.
GOAL GH EC-2  Encourage, when and where economically and ecologically feasible, the retention and development of locally-oriented marine industry, aquaculture, local agriculture, and local forest products management.

GH EC-2.1 Recognize the importance of the natural resource industries of aquaculture, forestry, and marine resources.

GH EC-2.2 Encourage well-balanced and varied economic development which is clean, pollution free, and provides for employment opportunities.

GOAL GH EC-3  Promote opportunities for office parks in the UGA that can provide employment opportunities without heavy impacts to the environment.

GH EC-3.1 Work with the City of Gig Harbor, the Gig Harbor Chamber of Commerce, and the Economic Development Board for Tacoma-Pierce County to attract investment, internet, banking, telecommunications, and other similar businesses that primarily utilize office space and engage in professional occupations.

GH EC-3.2 Allow office buildings to exceed height restrictions when perimeter buffers are provided and significant environmental impacts are avoided.

GH EC-3.3 Encourage parking underneath office buildings through incentive-based regulations.

GH EC-3.4 Encourage development of new office space within the Urban Growth Area.

GOAL GH EC-4  Encourage the growth and development of commercial and civic services that are responsive to the needs of the community and minimize the need to travel across the Tacoma Narrows Bridge.

GH EC-4.1 Allow for shopping, service, and leisure-time opportunities that serve the community.

GH EC-4.2 Encourage the development of restaurants, clothing stores, auto-repair, and other services in response to growth demands.

GH EC-4.3 Support opportunities for development, expansion, or extension of higher education facilities in the community.

GH EC-4.4 Encourage the development of a hotel or conference center in the Purdy area to take advantage of the proximity to Henderson Bay.

GOAL GH EC-5  Identify existing and future demand for services to support planned actions within the Community Employment Center.

GH EC-5.1 Identify necessary infrastructure improvements through planned action(s).

**Implementing Actions**

The following is a list of actions that needs to be completed in order to implement the policies contained within the Economic Element. They are arranged according to the timeframe within which each should be completed: short, medium, or long term. Short term actions should
occur immediately or within one year of plan adoption. Mid-term actions should be completed within 1-5 years. Long term actions should be completed within 5-10 years of plan adoption. The party or parties responsible for leading the effort to complete the action item are listed in parenthesis following the action. Actions are assigned to the Gig Harbor Peninsula Community Planning Board (GHPCPB), the Peninsula Advisory Commission (PAC), or Pierce County Planning and Land Services (PALS). Those actions assigned to the GHPCPB are completed as part of the adoption and implementation of this plan.

**SHORT TERM ACTIONS**

1. Write implementing regulations that allow home occupations throughout the Gig Harbor Peninsula. (GHPCPB, PALS)
2. Provide a zone in the urban and rural area that limits the square footage of businesses to allow affordable opportunities for small entrepreneurs. (GHPCPB, PALS)
3. Allow opportunities for resource-based industries such as aquaculture, agriculture, and forestry within the plan area. (GHPCPB, PALS)
4. Ensure office parks are allowed in one or more zones within the Urban Growth Area. (GHPCPB, PALS)
5. Develop zones where shopping, service, and leisure activities are allowed and would result in minimum impacts to the environment. (GHPCPB, PALS)
6. Ensure zoning does not promote strip development and directs uses with heavy impacts to the environment or transportation system into appropriate areas. (GHPCPB, PALS)
7. Consider a zone within the Purdy area that would allow a hotel or conference center. (GHPCPB, PALS)

**MID-TERM ACTIONS**

1. Work with the city, chamber, and the Economic Development Board to promote and attract professional businesses such as investment, Internet, banking, and telecommunications. (PALS, PAC)
2. Work with the city, chamber, and the Economic Development Board to promote and attract service based businesses, such as restaurants, clothing stores, and auto-repair in response to growth demands. (PALS, PAC)
3. Work with the City of Gig Harbor and Pierce County in developing regulations to allow height restrictions to be exceeded in certain zones. (PALS, GHPCPB)
4. Work with the City of Gig Harbor and Pierce County to write incentive-based regulations that would allow parking under office buildings. (PALS, GHPCPB)
5. Decide the order in which planned actions should be completed for each Employment Center. (PALS, PAC)
6. Work with the city and/or County to complete planned actions for the various employment centers. (PALS, PAC)
LONG TERM ACTIONS

1. Work with the Chamber of Commerce, the City of Gig Harbor, Pierce County, the Economic Development Board, and private investors to encourage and attract commercial and civic services for the Peninsula that would serve the needs of the community and limit the need to travel across the Narrows Bridge. (PALS)

2. Investigate and pursue the possibility of obtaining and/or expanding higher education facilities and a hospital or health care related facilities. (PALS)
Chapter 6: Facilities and Services Element

Introduction

The Facilities and Services Element articulates the need for facilities and services that will implement the visions and goals of the community plan. Facilities and services are collectively considered infrastructure and may include public or privately funded projects. The policy statements regarding infrastructure provide direction to investors and decision-makers about what capital investments are desired and needed by the community. In some cases, this element also prioritizes the projects and suggests potential funding sources to complete the projects.

Description of Current Conditions

The following section provides an analysis of the existing infrastructure and services in the community plan area. This information provides the basis for analyzing the levels of service (LOS) for infrastructure in the community and for developing policies which articulate the community's desires. The LOS described in this section may show that some facilities or services exceed Pierce County's adopted levels of service for public facilities or that there is a deficiency in certain circumstances.

Urban Facilities and Services

Urban services include but are not limited to transportation infrastructure (such as roads, sidewalks, street trees, street lighting), parks, sanitary sewage disposal, stormwater and surface water management systems, natural gas, and electrical service. Facilities are generally considered the physical structures in which a service is provided. One of the principal goals of the Growth Management Act (GMA) is for cities to provide compact Urban Growth Areas (UGAs) that accommodate the majority of growth and development in a community so that the necessary urban facilities and services are provided and delivered efficiently and cost effectively. Urban level facilities and services are permitted only within UGAs. Certain public facilities and services must be provided at a specific LOS, concurrently with development. This requirement is intended to ensure that development will not occur without the necessary infrastructure. The City of Gig Harbor and Pierce County share a variety of land use administration responsibilities in the UGA. Currently, Pierce County's facility and service standards differ significantly from the city's standards. Citizens are faced with an uncertain development pattern, developers are challenged with a burdensome administrative process, and the affected government officials have difficulty administering the regulations. The community plan offers a framework that would provide for consistent facility and service standards in the UGA for both Pierce County and the City of Gig Harbor. Developers and property owners are typically required to construct the necessary infrastructure or provide a fee to compensate for their fair share of facilities and services (as associated with a proposed building or development permit) that are necessary to maintain an established LOS (as defined
by Pierce County). This LOS standard for public facilities is identified in the Capital Facilities Element of the Comprehensive Plan.

**Rural Facilities and Services**

Rural facilities and services generally include the same infrastructure as urban facilities and services, but at lower service levels. A notable exception to this applies to sanitary sewer. Sanitary sewer facilities are considered an urban service and are specifically prohibited from locating in rural areas or extending into rural areas except under certain circumstances. Other facilities and services may locate in rural areas, but not at urban levels of service. As with facilities and services in the UGA, facilities and services in the rural area shall be in place as impacts associated with development occur. The LOS standard for public facilities is identified in the Capital Facilities Element of the Comprehensive Plan.

**Transportation**

The transportation system on the Gig Harbor Peninsula generally reflects the area's rural past and varied topography. The road system is primarily made up of two lane roads that are aligned based upon topography and other environmental constraints. The road network does not follow a grid pattern. The primary route into and out of the community plan area is State Route 16. This state highway runs northwest to southeast through the approximate center of the plan area from the Kitsap County line to the Tacoma Narrows Bridge. A series of east-west oriented County and city arterial roadways connect the local road network to the highway. These connecting arterials include 14th Avenue/Stone Drive NW, Olympic Drive NW, Wollochet Drive NW, Burnham Drive NW/Sehmel Drive NW, and State Route 302 (Purdy Drive).

No rail service exists in the plan area and transit bus service is minimal. Transit bus service is provided by Pierce Transit and is oriented primarily to weekday commuters travelling to and from work or school in Tacoma and Seattle. No weekend service is provided. Three commuter routes serve the area. Two of these routes provide outbound morning (5 a.m. to 8 a.m.) and inbound evening service (4 p.m. to 6:30 p.m.) service only, picking up and dropping off passengers at two park and ride facilities adjacent to State Route 16. The third route operates hourly providing service to and from Tacoma Community College in Tacoma and various locations in the City of Gig Harbor.

Freight service is provided almost exclusively by tractor-trailer truck. A general aviation airport (Tacoma Narrows Airport) exists in the community plan area and provides for some limited freight and passenger service into and out of the community. The airport is primarily oriented to service the needs of the small private plane owner and meets a very small percentage of the community's transportation needs.

Nonmotorized transportation facilities, such as sidewalks and bikeways, are very limited in the community. The facilities that are present are located primarily within the City of Gig Harbor or its Urban Growth Area. The lack of nonmotorized facilities and minimal transit service results in the community being extremely dependent upon privately owned motor vehicles to meet daily transportation needs.
Parks and Recreation

Prior to 1958, the Metropolitan Park District of Tacoma provided most of the park facilities and recreation programs throughout Pierce County. In 1958, the Board of Pierce County Commissioners created the Department of Parks and Recreation for Pierce County. At this time, several park sites outside the City of Tacoma were conveyed to Pierce County. The Pierce County Parks Department continued to grow in the 1980s and 1990s and established many recreational programs such as the All Abilities Camp, Sound to Narrows Race, mobile recreation, ski school, martial arts, aerobics, Tour de Pierce, Carless Commute, Cooperative Playshops, and sports leagues.

The Pierce County Comprehensive Plan contains general policies that serve as a guide for future development of park and recreation facilities in the County. These policies cover a range of issues including the responsibility for providing of parks, technical assistance, and location criteria for new parks. Section 19A.20.090 of the Comprehensive Plan states that the primary reliance is upon cities and towns and special purpose districts to provide local park facilities and services appropriate to serve local needs. The location criteria for park and recreation areas states that new parks must be located on public roads. If a park is located in an urban area then urban services need to be available. Open space passive recreation parks should be located on land offering significant environmental features.

The Pierce County Comprehensive Park, Recreation, and Open Space Plan (referred to as the Parks Plan) provides general direction and guidance for both facilities and programs. The Parks Plan does not contain project specific plans for the County’s park properties.

In 1994, Pierce County adopted a Comprehensive Park, Recreation, and Open Space Plan for the Gig Harbor and Key Peninsulas. This plan is often referred to as the Draggoo Study. The primary goals of this plan were to:

- Provide a full range of park and recreation services for all age groups and interests.
- Provide and support an efficient management structure that preserves local control and provides a system approach to the provision of park and recreation services.
- Reduce the burden on schools in providing for community recreation needs.
- Preserve and protect important natural areas for parks, trails, open space and shoreline use.
- Develop and support a broad and reliable funding base to support plan implementation and long-term provision of park and recreation services.
- Ensure that recreation program needs are met within the Gig Harbor Peninsula.

The 1994 plan specifically addressed and made recommendations for levels of service for neighborhood parks, school-parks, community parks, natural open spaces, regional parks, and special use areas such as boat launches, shoreline access points, trails, indoor recreation spaces. Pierce County did not implement this park and recreation plan, principally because the LOS standards recommended in the plan were greater than described in the Countywide Capital Facilities Plan.
The Gig Harbor Peninsula Community Plan area contains a variety of park sites. Table E-13 describes Regional Park sites located in the community plan area that are accessible for use. See also Map E-5: Existing Parks and Recreation.

**SANITARY SEWER AND WASTEWATER**

Sewage disposal service is provided to approximately 3.7 square miles of the plan area by the City of Gig Harbor. The city currently provides sewage disposal service to 122 accounts outside its city limits. The majority these accounts are located within the designated UGA boundary. One of these accounts includes a community septic system servicing 13 residential customers. The Washington Corrections Center for Women at Purdy and the Canterwood development are also included and counted as two individual accounts. The plan area outside the City of Gig Harbor’s service area utilizes septic drainfields for sewage disposal.

**GIG HARBOR WASTEWATER TREATMENT PLANT**

The Gig Harbor wastewater treatment plant is an activated sludge plant, designed to treat a flow of 0.7 MGD (millions of gallons per day) and an organic loading of 1800 lbs. BOD$_5$/day (Biological Oxygen Demand – 5 day). The treated effluent is discharged into Gig Harbor via a submarine outfall pipe. Current plans by the City of Gig Harbor provide for an expansion to 1.6 MGD to serve a population of 16,000 by approximately 2002.

The existing collection system includes nine pump stations. Six were built in 1973-74 when the original sewer system was constructed. In 1980, as part of the annexation of the Olympic Village commercial area, a seventh pump station was constructed. An eighth pump station was constructed in 1984 as part of a community drainfield system for 20 lots, and the ninth pump was built in 1989 to serve a basin south of the City of Gig Harbor previously developed on septic drainfields.

**STORMWATER**

As natural vegetative cover is replaced with development, surface water runoff (stormwater) tends to increase both in volume of runoff and rate at which the water drains off the land. Stormwater that has not been properly addressed can result in flooding, water quality and
habitat degradation, negative impacts to fisheries, and erosion. Stormwater related issues can be correlated to the amount of impervious surface within a watershed. Although total impervious surface area related to development is not the only factor in evaluating stormwater issues, it is a readily measurable indicator that can be correlated to stormwater problems by tracking trends as total impervious surfaces increase within a basin.

In the Gig Harbor basin, rainfall from small storm events would historically stay on site, being trapped in numerous small depressions and saturating the top several feet of soil. Flooding would only occur during larger storm events when the amount of water the land could naturally absorb was reached and water would be conveyed downstream. As development occurs, many small depressions are graded smooth and the top several feet of soil is removed or compacted. The ability of the land to contain the smaller storm events is eliminated and subsequently flooding occurs during even the smallest storms.

Stormwater from impervious surfaces is typically concentrated in higher density residential developments, commercial sites, and in industrial areas, but any road, roof, or compacted turf can add to the level of impervious cover in an area. Any impervious surface can contribute a variety of pollutants to the surface water, but typically commercial areas have higher concentrations of the metals, oil, petroleum, and other compounds than runoff from other surfaces. Many of the fluids and metals that are produced by cars have a higher toxicity than pollutants from other sources. In addition, paved surfaces can increase the speed and amount of water leaving a site. This increases the size of the drainage systems needed to accommodate the additional flow.

Pierce County has a National Pollutant Discharge Elimination System permit with the Washington State Department of Ecology. This is Pierce County’s permit to discharge stormwater to waters of the state. In order to gain this permit, Pierce County has had to institute the following programs to guarantee the quality of that stormwater.

• Stormwater Management & Site Development Manual – provides guidance on reducing stormwater flows and erosion from new construction.
• Best Management Practices Manual – provides guidance on ways in which existing businesses and residences can reduce or prevent pollution.
• Illicit Discharge Ordinance – Makes it illegal for any business or individual to cause Pierce County to violate its permit. It includes an inspection program.

DOMESTIC WATER

The Department of Ecology issues water rights in Washington State. A water right is a legal authorization to use a certain amount of public water for specific beneficial purposes. State law requires every user of streams, lakes, springs, and other surface waters to obtain a water right permit unless they use 5,000 gallons or fewer each day. A water right will be issued only if it is determined that water withdrawal will not have a detrimental effect on other nearby wells. Water rights are based on anticipated average daily flows from the proposed use and are approved for a specified number of wells.
Currently within the plan area, there are 92 small Group A water systems that have either 15 or more connections or serve 25 or more people per day for 60 or more days per year regardless of the number of connections. Forty-four separate water purveyors are responsible for operating these systems. The three largest purveyors on the Peninsula are Washington Water Service Company (WWSC) at 21 square miles, City of Gig Harbor Water Department at six square miles, and Rainier View Water Company at four square miles. Peninsula Light has just begun to provide water service to its customers with an area of coverage measuring 590 acres, including approximately 263 acres on Fox Island. Fox Island Mutual Water Association (FIMWA) is the primary water purveyor on Fox Island, serving approximately five square miles.

WWSC, Gig Harbor’s Water Department, and FIMWA all have water systems plans approved by the Washington State Department of Health. As required by state law, water service areas are exclusive service areas, which means only the designated system is to provide public water service to properties within the individual service areas. The community plan area also includes a multitude of individual wells and Group B systems, which are systems serving 2-14 connections. There is not a complete inventory of individual wells or Group B systems available at this time.

**SOLID WASTE**

Solid waste management in Pierce County is governed by the Tacoma-Pierce County Solid Waste Management Plan, which under state law is an integrated system plan addressing all issues related to solid waste collection, disposal, and processing. The following solid waste management services are provided to residences and businesses in the Gig Harbor community plan area:

- Refuse collection service is provided to residential and commercial customers by American Disposal, franchised under the authority of the Washington Utilities and Transportation Commission. Waste Connection of California is the parent company of American Disposal.
- American Disposal provides curbside pickup of recyclables, including mixed waste paper, cardboard, newspaper, glass, and cans to single-family and multifamily residential customers. Under federal and state law, the County cannot be involved in commercial or industrial recycling. Several private companies in Pierce County offer commercial and industrial recycling services.
- The Purdy Transfer Station located near Purdy at 14515 – 54th Avenue NW also provides recycling facilities as well as disposal services for appliances and other non-hazardous solid waste for plan area residents.
- American Disposal provides yard waste containers and pick-up for plan area residents once per week and residents can also utilize the Purdy Composting Facility at the Purdy Transfer Station for disposing of large amounts of debris.
- Under an agreement with the City of Tacoma, Pierce County residents may dispose of their household hazardous waste at the Tacoma Landfill Hazardous Waste Collection Facility located at 3510 S. Mullen in Tacoma. The facility is open seven days per week and a list of materials accepted and not accepted at the site is available.
The existing solid waste facilities within the community plan area are described in Table E-16.

### Table E-16: Existing Solid Waste Facilities

<td></td>
</tr>
</tbody>
</table>

Solid waste that is not disposed of correctly can result in a variety of negative environmental consequences. Household hazardous waste can damage aquifers and the water quality of streams when gasoline, oils, and antifreeze are disposed of improperly. The short ravines commonly found in the Gig Harbor area can be a popular target for people looking to illegally dump garbage, yard waste, appliances, tires, hulks, and even commercial waste. Yard waste and grass clippings are the most common items dumped by adjacent landowners.

### POWER - ELECTRIC AND NATURAL GAS

#### ELECTRIC POWER

Electric power is supplied to the plan area from two sources. Peninsula Light Company supplies electric power to the entire plan area, except 115 customers at the north end of Crescent Valley Drive who are served by Puget Sound Energy.

#### PENINSULA LIGHT COMPANY

The Peninsula Light Company was established in 1925 as a non-profit member-owned utility. Peninsula Light currently serves approximately 26,000 members in a 107-square mile area of Pierce County west of the Tacoma-Narrows Bridge. The service area includes Key Peninsula, Gig Harbor Peninsula, Fox Island, Tanglewood Island, Raft Island, and Herron Island.

#### PUGET SOUND ENERGY

Established in 1997 with the merger of two local power companies, Washington Energy Company and Puget Sound Power & Light Company became Puget Sound Energy (PSE). PSE is a public utility that provides electric and gas service to a territory covering approximately 6,000 square miles in 11 counties and including more than 1.2 million homes, primarily in the Puget Sound region. PSE purchases approximately 75 percent of its electricity with the remaining fraction generated by company-owned sources.

Currently, only one small area with approximately 100 customers north of 144th Street NW between Crescent Valley Drive NW and 14th Avenue NW is being provided electricity by PSE within the plan area.
NATURAL GAS

As of October 2000, Puget Sound Energy has a total of 6,817 (6,421 residential and 396 commercial) natural gas customers in the Gig Harbor Peninsula area. The average peak winter usage for a 24-hour period is 4.8 million cubic feet of natural gas. Over the past 4 years, Puget Sound Energy has experienced a steady average of 5.8% customer growth. New customers include both new construction and conversion of existing residential and commercial customers. Puget Sound Energy anticipates this growth rate to continue into the future.

The Gig Harbor/Kitsap Peninsula is currently served by twin 8-inch-diameter natural gas lines installed in 1969 from Zenith (near Des Moines) across East Passage of Puget Sound to Robinson Point on Vashon Island. The system transitions to a single 6-inch line across Maury and Vashon Islands, another pair of 8-inch lines crosses Colvos Passage. A single pipeline that combines 8 and 12-inch lines continues into the City of Gig Harbor. Throughout the Peninsula, Puget Sound Energy operates and maintains a total of 156 miles (823,000 feet) of natural gas distribution lines that supply natural gas to the individual customers.

During late fall through early spring when natural gas use is at its peak, the existing system is unable to provide sufficient capacity to serve current customers. Puget Sound Energy has augmented the natural gas supply using trucks with compressed natural gas and liquefied natural gas to inject into the natural gas system on the Gig Harbor/Kitsap Peninsula each peak heating season to prevent service interruptions to residential and commercial users on the Peninsula. Based on Pierce County’s projections of growth within this service territory, shortfalls in supply of natural gas will increase in duration and severity.

Puget Sound Energy has completed an environmental impact study and is in the process of completing environmental permitting for the installation of a twin 12-inch gas line crossing at the Tacoma Narrows from Tacoma to Gig Harbor. As a result of a number of factors, Puget Sound Energy is presently evaluating other alternatives to meet current and future demands for natural gas on the Gig Harbor Peninsula. Included in the alternatives is a permanent liquefied natural gas facility on the Gig Harbor Peninsula.

FIRE PROTECTION

Fire District No. 5 serves a population of approximately 42,000 over an area measuring 54 square miles, which encompasses the entire plan area including the City of Gig Harbor. District No. 5 headquarters and its training facility are located at 10222 Bujacich Road NW. There are a total of nine fire stations in the district, with three designated as primary (Swede Hill, Artondale, and Gig Harbor) and staffed 24 hours a day with career personnel. The other six are staffed with volunteers and one to three resident volunteers who live at the station. Response times currently average between 5-6 minutes.

</tbody>
</table>

All stations are equipped with classrooms/community meeting facilities, an office, a full kitchen, living quarters, public and employee restroom facilities, an emergency generator, and a large paved drillground. All are handicapped-accessible and have emergency public 911 phones.

Pierce County Fire District Number 5 is in the process of developing a long-range plan that includes more prevention activities, a shared maintenance facility with the Pierce County Sheriff’s Department, and the purchase of a ladder truck. The fire district also plans to increase staffing by three additional firefighters per year for the next two years at the primary stations. The fire district plans to continue efforts to enhance its response services to include special rescue operations.

**LAW ENFORCEMENT**

Three separate entities provide police protection and enforcement within the community plan area. The Pierce County Sheriff is primarily responsible for the unincorporated portion of the plan area. The City of Gig Harbor Police Department provides service in the city limits. The Washington State Patrol focuses on SR 16 and SR 302.

The LOS standard for Sheriff Department buildings is 0.31 square feet per capita. Currently, 1,272 square feet of space is available at the Peninsula substation resulting in a deficiency of 59,446 square feet.

**PUBLIC SCHOOLS**

The plan area is served by Peninsula School District No. 401. The district includes eight elementary schools, four middle schools, and three high schools, with a total capacity of 8,217 students. Capacity is based on 1999 school district service standards of 102 square feet per student at the elementary schools, 121 square feet per student at the middle schools, and 146 square feet per student at the high schools. Enrollment in 1999 was 9,049 students.

Below is a breakdown of capacity and enrollment number of students per school:

</table>

* school is located outside of community plan area

Peninsula School District’s Capital Facilities Plan for 1999-2005 provides for the construction of an additional elementary school with a capacity for 550 students, an additional middle school with a capacity for 650 students, and an additional high school with a capacity for 1,300 students. This will increase total capacity of the district by 2,500 in the year 2005. These additional facilities will address the current net capacity deficiency of -832 students as well as accommodate the projected demand for 905 additional students by the year 2005. The projected 2005 totals will be 9,954 enrolled students with a total capacity for 10,717, leaving a net reserve capacity for 763 students.

**Library Services**

The plan area is served by the Pierce County Library System. The library system is funded primarily through a property tax levy at a rate of 50 cents per $1,000. The Pierce County Capital Facilities Plan identifies a LOS standard for library space of .47 square feet per capita.

Although the system is not divided into service areas, branch libraries generally serve the surrounding area. The Peninsula Library is a branch library located within the southernmost city limits of Gig Harbor on Point Fosdick Drive NW between 45th Street Court NW and Harbor Country Drive NW just south of the Harbor Plaza shopping center. The branch has the
equivalent of 15.9 fully employed library staff. It has a total floor space of 15,214 square feet with 90,451 catalogued books. The total collection size is 130,890.

Peninsula Library is open 56 hours per week, but residents within the Pierce County Public Library service area may visit or check out materials at any library branch in the system. Interlibrary transfer of materials is available so that a patron can pick up requested material from the branch closest to home or work. Periodicals and other catalogued materials are available online on a computer database.

**Description of Desired Conditions**

Infrastructure and services are necessary to support and sustain a healthy level of growth and development while maintaining the quality of life in the community. The description of desired conditions articulates the level of service (LOS) of facilities and services that the community desires. The description of desired conditions provides direction to investors and decision-makers about what investments are desired and needed by the community. In most cases, the policies that are described in this section are directly based on the desired conditions that have been proposed by the citizens that live in the plan area. The community intends to ensure that the infrastructure, facilities, and services which are necessary to support development are adequate to serve new projects at the time the buildings are available for occupancy and use without decreasing service levels below locally established minimum standards.

**Urban Facilities and Services**

The Urban Growth Area is intended to accommodate the majority of new growth and development in the community plan area. It is important therefore, that the majority of public expenditures for urban facilities and service should also be directed to UGA. Urban levels of service should be required as a component of all new development in the UGA. Pierce County should ensure that new development supports the costs associated with public facility and service expansions that are made necessary by each development project. The UGA should not exceed a size that can be serviced by the urban facilities and services that exist or can be provided within a 20-year planning horizon. Prior to expanding the UGA, it must be demonstrated that adequate public facilities and services can be provided for each public facility and service. In the future, the City of Gig Harbor will annex the UGA. Because the UGA will ultimately become part of the City of Gig Harbor, the city may impose its standards for outside utility contracts for those properties that will connect to the city's public utility systems.

**Rural Facilities and Services**

Urban levels of service should not be permitted outside of the City of Gig Harbor's UGA. Development that requires infrastructure that meets or exceeds adopted levels of urban services should not be permitted in the rural area. Sewer interceptors and sewer connections from interceptors shall extend only into the rural area where sewer service will remedy groundwater contamination or other health problems, as determined by the local Health Department, by replacing septic systems and community on-site sewage systems. Urban
development standards such as curbs, gutters, sidewalks, and street lighting shall be optional amenities that may be used in the rural area at the discretion of the landowner.

**TRANSPORTATION**

The transportation system on the Gig Harbor Peninsula should be improved and continue to develop such that it can accommodate existing and future volumes while minimizing the physical impacts of new road construction on the natural environment. The community also desires to improve nonmotorized transportation opportunities by providing a system of sidewalks, pathways, trails, and bicycle routes throughout the plan area. The policies in the community plan call for improving transportation system concurrency and ensuring greater equity in the funding and construction of facilities necessary to support growth by evaluating and modifying the method in which transportation impacts are assessed. Policies also call for the construction of new roadways to be in greater harmony with the natural environment. Policies are also proposed which strongly encourage the development of nonmotorized opportunities within and adjacent to new development and along new and reconstructed public roadways. A series of modifications to the project recommendations of the Transportation Element of the Pierce County Comprehensive Plan are also proposed which are intended to improve traffic circulation and safety within the community. See the Transportation Project Recommendations Map (Map 12-28).

The Transportation Project Recommendations found in the map and the tables in The Transportation Element Appendix D address both County roads and State highways. The recommendations for County roads are intended to directly affect the programming of projects in the County’s Six-Year Transportation Improvement Program and resulting implementation. The State highway projects found in the Community Plan can be viewed as advisory recommendations, but are not part of the State’s planning process. It should be noted that the State highway recommendations in this Community Plan are not completely consistent with those found in Washington’s Transportation Plan. The inconsistent recommendations can be viewed as a message from the community to the State concerning which projects might be appropriate to consider in subsequent updates of Washington’s Transportation Plan. A listing of the State Highway System Plan projects is being added to the Pierce County Comprehensive Plan as part of the 2001 plan amendment that will bring the Transportation Element in compliance with the requirements of HB1487. Future updates of the Gig Harbor Peninsula Community Plan should consider the Comprehensive Plan amendments.

**PARKS AND RECREATION**

**PARKS**

Pierce County should continue to function as the regional park provider on the Peninsula and work with the City of Gig Harbor and the community in their efforts to provide an extensive system of community and neighborhood parks. There is a strong desire to have more neighborhood and community level parks (that contain sport fields, trails, and playgrounds).
spread evenly throughout the community plan area. There is also a strong community desire to have more regional parks that provide access to the marine shoreline. These waterfront parks should include a range of facilities such as providing shoreline access at the end of County roads or boat launches with marine floats and associated parking and restroom facilities.

New park areas should be located, designed, and maintained to meet the needs of the community. It is important that neighborhood and community parks be located within walking distance of residential neighborhoods and connected, whenever possible, by nonmotorized transportation trails which serve pedestrian and bicycles. These park areas should create a balance between active recreation uses, passive recreation uses, and natural open space areas and when possible, incorporate historical or educational components.

Finding funding sources for acquisition and maintenance of new park facilities is a challenge. However, when properties suitable for parks or trails become available, they should be purchased and put in trust for future development. Existing County-owned land (including road ends at the shoreline) should be reviewed to determine if any portion of these parcels is suitable for parks. Public and private partnerships for development of parks should be encouraged and, where feasible, incorporated into community development projects. Pierce County should enter into a partnership with the Peninsula Park and Recreation District to pursue community and neighborhood park facilities. Specific funding mechanisms for acquisition, development, and maintenance of neighborhood and community parks, such as instituting a fee-in-lieu of the park land dedication or a development impact fee, should be provided. An adequate amount of land within new subdivisions and existing neighborhoods to meet the non-organized recreational needs of residents should be provided. The LOS for parks on the Gig Harbor Peninsula should be consistent with the County-wide LOS as described in the current Capital Facilities Plan. Existing parks and any new park or trail sites that are acquired should be adequately protected, through a conservation easement or covenant, so that they will remain in such capacity in perpetuity.

**Specific Park Acquisition Sites**

The community has identified the following sites as potential park and recreation facilities. The size of the site, location, ownership, and recommended use of each property are provided. All park and recreation providers, including Pierce County, the City of Gig Harbor, the Peninsula Park and Recreation District, and other private organizations should strive to acquire property for parks, trails, and open space before the properties become cost-prohibitive for parks and recreation use. The potential acquisition sites that are identified are not listed in order of priority.

Also, see Map E-6: Park Acquisition Recommendations and Map E-7: Proposed Trail System.

</tbody>
</table>

*Not in order of priority

Parking areas near boat launch sites are very limited in the plan area. The community has identified the following sites for potential acquisition. All of the properties could accommodate vehicles and boat trailers and several of the sites could provide additional amenities such as picnic tables and restrooms. The potential acquisition sites that are identified are not listed in order of priority.

</table>

*Not in order of priority*

**Recreation**

Recreation is the active use of a park or facility or passive use of a walking trail or nature area. Recreational programs often serve as a mechanism for community pride and interest. Within the community, there is a desire for more recreational facilities and programs. Additional recreational programs should be established and include: sport courts, softball and baseball fields, a swimming pool, and trail systems for horseback riding, bike riding, and walking. Recreational programs and facilities should be designed to be flexible in accommodating new recreational opportunities that may arise in the future (i.e., skateboarding and rollerblading.) The development of a community-based sports complex to reduce dependence upon County, city and school district facilities should be pursued.

**Specific Recreation Improvements**

Additional recreation facilities are desired in the community. As the population of the plan area increases, more pressure will be placed on the existing park and recreation providers (such as the public schools) to provide facilities for organized recreation. Table E-21 provides a list of active recreational facilities that the various park and recreation providers in the community should consider providing. This list does not attempt to prioritize the various needs.
Table E-21: Active Recreational Facilities Inventory and Needs Analysis

</tr>
</tbody>
</table>

(1) The facility type category includes a variety of public and private recreational facilities that are provided throughout the community. Some of these facilities (such as school district fields) may be not be accessible to the general public at various times.

(2) The recommended standard is a ratio of the number of facilities needed for the given population. The 2017 population on the Peninsula at a growth rate of 2.38 percent is estimated to be 52,222.

SANITARY SEWER AND WASTEWATER

The City of Gig Harbor provides the only sanitary sewer service in the plan area. Although Pierce County provides the majority of sewer service throughout the County, the County has no plans to provide sewer service on the Gig Harbor Peninsula. Pierce County should continue to advise applicants seeking County building or development permit approval in the UGA to contact the City of Gig Harbor early in the permit review process for information on city contracted requirements and utility construction standards. A major goal of sewage system regulations is to prevent new permanent on-site and community septic systems within the UGA, however, interim on-site septic systems may be allowed when sewer is available, but the city of Gig Harbor does not provide service. Projects that utilize interim on-site septic systems should be designed to connect with sewer facilities as they become available in the future.

STORMWATER

Many of the existing surface water runoff problems in the community are the result of development that occurred under the County’s previous site development regulations. Unfortunately, much of what appears to be “new” development now under construction was vested and as such reviewed and approved under the old site development regulations.

Accommodating new growth is important, but also of equal value is the need to maintain the natural hydrologic conditions and functions in the watershed. As new development occurs in the future, the County should strive for near zero change in hydrologic function on the property (i.e., no increase in peak flow or volume of runoff or erosion from the site.) The County should explore future revisions to the existing stormwater regulations which further reduce and/or...
eliminate the negative impacts of current development practices on the aquatic environment. New development should be designed in such a manner that surface water runoff will not increase beyond the existing condition. Low impact development techniques and surface water best management practices should be used to achieve this goal.

Many of the stormwater problems in the plan area will be reduced if policies described in the Facilities and Services Element are implemented along with the design standards from Pierce County’s Stormwater and Site Development Manual. The community would like to see a variety of programs and regulations implemented on the Gig Harbor Peninsula including:

- Institute an Impervious Cover Reduction Program.
- Identify areas along roads as “No Spray” zones.
- Encourage establishment of commercial car washes with recycling systems.
- Encourage businesses that offer oil, antifreeze, solvent, and battery recycling.
- Discourage the following activities in areas not served by sewers: cement manufacturing, chemical manufacturing, electroplaters, food processors, glass products, industrial machinery and equipment, metal products, paper and pulp, petroleum products, printing, rubber and plastic products, wood products, recyclers, laundries and other cleaning services, businesses which offer pools and spas as amenities, hotels, hospitals, nursing homes, and schools.
- Identify opportunities in land use permitting processes to get dry wells retrofitted and other BMPs installed.
- Support educational programs on water quality for industrial and commercial property owners.
- Provide incentives to property owners who voluntarily implement BMPs.
- Implement and enforce Pierce County’s Stormwater and Site Development Design Manual and Illicit Discharge ordinance.
- Establish educational and regulatory programs that will reduce the instances of improperly installed “spaghetti” drainage hose along shorelines.

The proposed Surface Water Management program includes 6 capital projects within the Gig Harbor Peninsula Plan area. Capital projects generally represent improvements and repair to existing drywells, ponds, culverts, fish ladders, floodproofing facilities, pipeline outlets, pipelines, raised roads, and habitat acquisition. The proposed financing of these capital projects is from the Surface Water Management Fund. Table E-22 describes capital facilities projects on the Gig Harbor Peninsula.

<table>
<thead>
<tr>
<th>Projects for 2001-2006</th>
<th>Projects for 2001-2006</th>
</tr>
</thead>
<tbody>
<tr>
<td>Crescent Creek Habitat Acquisition</td>
<td>Wollochet Creek Habitat Acquisition</td>
</tr>
<tr>
<td>McCormick Creek Fish Passage</td>

</tr>
<tr>
<td>Sylvia Lake Sediment Pond</td>
<td>Artondale Creek Habitat Acquisition</td>
</tr>
</tbody>
</table>

The following non-capital alternatives discuss strategies, programs, technologies, and other alternatives that do not require capital improvement projects to achieve the standards for
Surface Water Management capital facilities LOS within the Gig Harbor Peninsula Community Plan area.

- Contract with private developers to provide increased capacity to accommodate existing capacity problems/mitigate existing drainage problems.
- Acquire flood prone properties and relocate or demolish structures within flood prone areas.
- Raise existing improvements above the 100-year flood plain.
- Preclude new construction, grading, and filling within 100-year floodplain.
- Proactively enforce standards for stormwater control on new developments.
- Restrict construction of certain types and sizes during the wet season (October-March).
- Lower costs to the Surface Water Management Utility for land acquisition by pursuing shared use of County-owned property for the construction of detention/retention facilities. In some instances, these facilities could be located in the existing County Park property and County Transportation Services Division facility property.
- Inspect and enforce the maintenance of private stormwater facilities. Require that these private facilities function as they were originally intended.
- Consider a requirement of retrofitting private stormwater facilities to bring these stormwater systems up to current standards over time.
- Promote coordination between Surface Water Management and Planning and Land services by involving Surface Water Management at an early stage in the project planning process and in the comprehensive planning process.
- Acquire, enhance, expand, or create wetlands for use in a wetland banking program.
- Utilize areas for stormwater disposal in conjunction with wetlands creation.

**DOMESTIC WATER**

Groundwater must be managed so that withdrawal rates will not exceed recharge rates in order to preserve the quality and supply of the Peninsula’s groundwater resource. Pierce County does not provide domestic water service on the Gig Harbor Peninsula. The County shall advise applicants seeking County building or development permit approval who are also seeking City of Gig Harbor water utility services to contact the city early in the permit review process for information on city contracted requirements and utility construction standards.

Water conservation measures should be encouraged and implemented by Pierce County whenever possible. Pierce County and the T.P.C.H.D should work together to limit new wells and development activities that require water withdrawals in those areas on the Peninsula that have been identified as being at risk for saltwater intrusion. The County should identify and protect the aquifer recharge areas throughout the Gig Harbor Peninsula through the Kitsap Water Resource Inventory Plan for WRIA #15. Pierce County should implement adaptive management strategies based upon the information received from groundwater monitoring programs.
**SOLID WASTE**

The Gig Harbor Peninsula should be provided with an environmentally sound, economically responsible means of solid waste management that balances the need for this service with the costs of waste disposal. Pierce County should encourage recycling and promote programs that reduce the volume of solid waste. Private industry should be encouraged to provide sufficient disposal capacity for waste collection and processing capacity for recyclables produced in the plan area. All residents of the Gig Harbor Peninsula should have access to refuse disposal and recycling collection services.

**POWER - ELECTRIC AND NATURAL GAS**

Reliable utility service should be provided in the community plan area to accommodate growth in a way that balances public concerns over the impacts of utility infrastructure with the consumer's interest in paying a fair and reasonable price for utility products. Utility providers should consider the community's natural environment and the impacts that utility infrastructure may have on it together with the community's desire that utility projects be aesthetically compatible with surrounding land uses when planning for and constructing utility facilities.

Regional electrical and natural gas facilities should be permitted in the plan area. Pierce County should support expansion of electric utility facilities to meet future load requirements and support conservation measures to aid in meeting future growth needs.

**FIRE PROTECTION**

Cost effective fire protection services should be maintained in the community. Response times should not exceed the current average of 5 to 6 minutes throughout the community plan area. Pierce County and the County's Fire Prevention Bureau should continue to support the efforts of Fire District # 5 in responding to the increasing population and demand for services on the Gig Harbor Peninsula. Enforcement of fire and life safety codes should continue to be part of the review process for all building permits issued by Pierce County.

**LAW ENFORCEMENT**

The three separate entities providing law enforcement within the community plan area should provide support outside of their primary jurisdictional territory when necessary.

The level of service standard for Sheriff Department buildings is calculated in the Pierce County Comprehensive Plan at 0.31 square feet of office space per capita. This method for evaluating the LOS for Sheriff services may not be the most accurate or best approach. The County should evaluate the number of on-duty commissioned officers within the plan area to determine if a more accurate LOS is appropriate. Requiring an LOS based on the number of on-duty commissioned officers in the community would more accurately reflect the true LOS in the community.
Pierce County should also consider locating a new Sheriff’s station on the Gig Harbor Peninsula. Any new law enforcement facilities should be located in the UGA in an area that provides direct access to major arterial roads.

PUBLIC SCHOOLS

Peninsula School District Number 401 provides public education facilities in the community plan area. Pierce County should coordinate future capital facilities planning with the Peninsula School District. School district facility needs and requirements should be considered when making land use decisions that could impact district facilities. New schools should be sited in the UGA near the student population that would be served by the proposed school facility.

The school district provides many of the recreational facilities and play fields in the community. The Pierce County Parks Department should continue to work with the Peninsula School District to coordinate a schedule for limited community use of the school district facilities.

The student enrollment should not exceed classroom capacity. School impact fees should be paid to the district to adequately mitigate the impacts to school facilities that are generated by new residential growth within the community plan area.

CAPITAL IMPROVEMENTS FOR ACHIEVING LOS

Peninsula School District’s Capital Facilities Plan for 1999-2005 provides for the construction of an additional elementary school with a capacity for 550 students, an additional middle school with a capacity for 650 students, and an additional high school with a capacity for 1,300 students for a total capacity increase of 2,500 by the year 2005.

These schools will address the current net capacity deficiency of -832 students as well as accommodate the projected demand for 905 additional students by the year 2005. The projected 2005 totals of 9,954 enrolled students would be served by with a total student capacity of 10,717, leaving a net reserve capacity for 763 students.

LIBRARY SERVICES

The plan area is served by the Pierce County Library System. The 15,214 square foot Peninsula library is classified as a regional branch library. This library service should continue to be provided in the community and the LOS should keep up with population growth. Any additional library facilities should be located within the UGA in a location that is convenient to people using them.

CAPITAL FACILITIES POLICIES

GOALS

Ensure that the infrastructure, facilities, and services which are necessary to support development are adequate to serve new projects at the time the buildings are available for
occupancy and use without decreasing service levels below locally established minimum standards.

**Urban Facilities and Services**

**GOAL GH CF-1**  Pierce County shall pursue a joint planning agreement with the City of Gig Harbor addressing urban services and facilities within the Urban Growth Area.

GH CF-1.1  A joint planning agreement with the City of Gig Harbor should specify the following:

GH CF-1.1.1  Standards for determining the adequacy and availability of public facilities and services;

GH CF-1.1.2  A process for coordinating the expansion of public facilities and services; and

GH CF-1.1.3  A process for coordinating capital improvement projects within the UGA.

GH CF-1.2  The City of Gig Harbor, at its discretion, may impose its standards for outside utility contracts on those properties that will connect to the city's public utility systems.

GH CF-1.3  Work with the City of Gig Harbor in ranking possible sites for planned public facilities and services using a priority system. Coordinate the provision of public services, sanitary sewer in particular, to sites which provide the greatest possible returns, unless private property owners can assist with the costs involved in extending or providing service.

**Rural Facilities and Services**

**GOAL GH CF-2**  Develop airport-compatible uses at the Tacoma Narrows Airport without urban levels of service.

GH CF-2.1  New uses that require urban levels of service, such as sanitary sewers, shall not be permitted in the Rural Airport designation.

**Fire Protection**

**GOAL GH CF-3**  Fire District #5 provides emergency services in the community plan area. Pierce County shall support the efforts of Fire District #5 in responding to the increasing population and demand for services on the Gig Harbor Peninsula.

**Law Enforcement**

**GOAL GH CF-4**  Three separate entities provide police protection and enforcement within the community plan area. The Pierce County Sheriff is primarily responsible for the unincorporated portion of the plan area. The City of Gig Harbor Police Department provides service in the city limits. The Washington State Patrol focuses on SR 16 and SR 302. Although each department has its own primary jurisdictional responsibilities, each department should provide support throughout the community when necessary.

Pierce County Comprehensive Plan | Gig Harbor Community Plan E-141
**Public Schools**

**GOAL GH CF-5** Peninsula School District #401 provides public education facilities in the community plan area. The Peninsula School District should be represented in all land use planning efforts in the community. Student enrollment should not exceed classroom capacity.

**Library**

**GOAL GH CF-6** The plan area is served by the Pierce County Library system. The 15,214 square foot Gig Harbor Library is classified as a regional branch library. This service should continue to be provided in the community and the level of service should keep up with population growth.

**Parks and Recreation Policies**

**Goals**

Provide adequate park and recreational facilities within the community plan area that satisfy the highest standards for environmental protection while meeting the needs of Peninsula residents. Provide and maintain a level of service for regional parks in the community that meets or exceeds the countywide standard. Promote various methods for park and recreation organizations and other interested citizens in providing community and neighborhood parks.

**Regional Parks**

**GOAL GH PR-1** New regional parks within the community plan area should be designed and located to serve the needs of community residents as well as providing countywide benefits. New regional parks should meet the following criteria:

- **GH PR-1.1** Locate park sites to take advantage of the physical amenities on the Peninsula. Priorities include shorelines, forested areas, and natural areas.
- **GH PR-1.2** The size of a regional park typically exceeds 40 acres; however, these parks may be developed on larger or smaller parcels. Parks that provide shoreline access are considered regional parks regardless of size.
- **GH PR-1.3** The various park and recreation providers on the Peninsula should acquire property for parks, trails, and open space when land becomes available and prior to actual need.

**Community Parks**

**GOAL GH PR-2** Community parks should provide primarily active recreation uses. Appropriate community park facilities include:
### Table E-23: Gig Harbor Community Park Facilities

<table>
<thead>
<tr>
<th>Facility</th>
<th>Minimum Size</th>
</tr>
</thead>
<tbody>
<tr>
<td>Multi-use indoor sports complex</td>
<td>3.5 acres for a site containing an aquatic facility, multi-purpose gymnasium, aerobics room, weight room, and support space</td>

<td>NA</td>
</tr>
<tr>
<td>Restrooms</td>
<td>500 sq. ft. - sewer or holding tank</td>
</tr>
<tr>
<td>Parking</td>
<td>162 square feet per stall</td>
</tr>
</tbody>
</table>

### Neighborhood Parks

**GOAL GH-PR-3**  
Create a system of neighborhood parks on the Peninsula. Require an adequate amount of land within new subdivisions and existing neighborhoods to meet the non-organized recreational needs of residents. Homeowner organizations typically maintain and operate subdivision parks.

**GH PR-3.1**  
Neighborhood parks should be separated from one another in a relatively even manner throughout the Peninsula. Neighborhood parks should be reasonably central to the neighborhood they are intended to serve.

**GH PR-3.2**  
Neighborhood park location is most often determined by site availability and land cost; however, site features such as topography and physical constraints should be considered prior to site acquisition.

**GH PR-3.2.1**  
A one to two-mile separation between neighborhood parks is desired.
GH PR-3.3  Neighborhood parks should be sized and improved to be consistent with the area the park is intended to serve.

GH PR-3.4  Neighborhood parks should provide both passive and active recreation uses. Appropriate facilities include:

<table>
<thead>
<tr>
<th>Table E-24: Gig Harbor Neighborhood Park Facilities</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Facility</strong></td>
</tr>
<tr>
<td>Practice field for softball and youth baseball</td>
</tr>
<tr>
<td>Practice field for soccer, football, or pick-up games</td>
</tr>
<tr>
<td>Multi-use paved games court (tennis, basketball)</td>

<tr>
<td>Picnic shelter building</td>
</tr>
<tr>
<td>Trails or pathways</td>
</tr>
<tr>
<td>Natural open space</td>
</tr>
<tr>
<td>Restrooms</td>
</tr>
<tr>
<td>Parking</td>
</tr>
</tbody>
</table>

GH PR-3.5  When sport fields for league play are located on school grounds, the recreation management agency should contribute to field investment and maintenance.

GH PR-3.6  Subdivision parks (mini-parks) should generally be provided in all new residential developments.

GH PR-3.6.1  Provide mini-parks in all new residential subdivisions and multifamily residential developments except when a fee in lieu of the park land dedication has been provided to the Peninsula Park and Recreation District that will mitigate for the impacts associated with the new residential development.

GH PR-3.6.2  The recreational area in a required mini-park shall consist of a minimum of 5,000 square feet and shall be in a separately dedicated park tract.

GH PR-3.6.3  Each mini-park should be improved with a variety of amenities such as a playground, sports court, tot lot, picnic facility, gazebo, on-site water line, and associated landscaping.

GH PR-3.6.4  Connect open space tracts, screening buffers, and stormwater facilities with any mini-park when possible to create the opportunity for a system of walking trails.
**TRAILS**

**GH PR-3.7** Opportunities for property acquisition that provide shoreline access trails, create looped or circuit trails, and trails that connect to the Tacoma-Lake Cushman Transmission Line Trail are a priority.

**GH PR-3.8** The trail system on the Gig Harbor Peninsula should eventually be linked with trail systems on the Longbranch Peninsula, in Kitsap County, and the regional trail system on the east side of the Tacoma Narrows Bridge.

**GH PR-3.9** Provide development incentives such as bonus densities and increased impervious coverage for projects that incorporate trails into the project site plan.

**GH PR-3.9.1** Consider designated trails for each subdivision and site plan approval.

**GH PR-3.9.2** Utilize the development incentives described in the Land Use Element to encourage trails in new development.

**RECREATION**

**GOAL GH PR-4** Encourage the development of a community-based sports complex to reduce dependence upon County, city, and school district facilities.

**GOAL GH PR-5** Encourage the development of a community center.

**GOAL GH PR-6** Encourage the multi-use system of sport fields for practice, league play, and tournaments (3-tiered concept).

**GH PR-6.1** Facilities generating crowd noise should be located in a manner as not to disturb adjoining residential uses.

**GOAL GH PR-7** Support the efforts of land trusts, the Peninsula Metropolitan Park and Recreation District, Tahoma Audubon, other open space organizations, and individuals in their efforts to acquire natural areas and environmentally sensitive lands on a Peninsula-wide basis.

**SHORELINE ACCESS**

**GOAL GH PR-8** Encourage acquisition of shoreline access points that provide opportunities for boat launches, public docks or piers, beach walking, wildlife viewing and other shoreline-dependent uses.

**GH PR-8.1** Boat launch length should be adequate to make the facility usable year-round at high and low tides. The site should be located in sheltered waters that have some protection from high winds if possible. Boat launch facilities should include a dock or pier to facilitate boat ingress and egress as appropriate for the location.
GH PR-8.2 Promote development of public and private pedestrian access to shorelands and tidelands. Property owners that provide public access to marine waters may be eligible for a property tax reduction.

GH PR-8.3 Prohibit the vacation or trading of unopened public rights-of-way at shoreline locations except when the vacation or trade would enable a public authority to acquire the vacated property for public purposes.

GH PR-8.4 Public easements dedicating access to designated public waterfront areas should be included as a part of private upland development projects prior to site development of the private development.

**TRANSPORTATION POLICIES**

GOAL GH T-1 Pierce County supports the efforts of Pierce Transit to acquire property and develop an effectively buffered park-and-ride lot near the proposed 24th/36th Street NW interchange. Such a lot will allow more direct access to eastbound bus service for residents of Fox Island and the southern Gig Harbor Peninsula.

GOAL GH T-2 Require site design that separates auto, pedestrian, and bicycle traffic access for safety purposes.

GOAL GH T-3 The County shall consult with the city of Gig Harbor and consider applying the city of Gig Harbor Public Works standards when constructing nonmotorized transportation improvements within the Urban Growth Area.

GOAL GH T-4 Buffer any new road in the unincorporated area that would otherwise be visible from SR 16 through retention of existing native vegetation and/or new native plantings, including shrubs and evergreen trees. Additional buffering provisions are included in other elements of this community plan.

GOAL GH T-5 Plant and maintain landscaped areas at the north side of the Purdy spit bridge and those areas within public rights-of-way at freeway interchanges to promote visually pleasing entrances to the community.

GOAL GH T-6 Encourage the Washington State Department of Transportation (WSDOT), Department of Corrections, and Pierce County to manage and replant any forested areas within their control along Highway 16 so as to maintain a complete visual screen along this highway.

GOAL GH T-7 Pierce County and the city of Gig Harbor should enhance landscaping within freeway rights-of-way in cooperative planting efforts undertaken with the Washington State Department of Transportation.

GOAL GH T-8 Street lighting, pedestrian facilities, and other safety improvements are a high priority adjacent to community facilities.
GOAL GH T-9  Utilize the results of the Pierce Conservation District's (PCD) survey of fish passage barriers that has been prepared for the Gig Harbor Peninsula and prioritize correction of any barriers in the next Capital Improvement Program (CIP) update.

GOAL GH T-10  Pierce County shall take an active role in coordination with WSDOT concerning proposed projects on state highways in Pierce County.

   GH T-10.1  Pierce County shall encourage completion of SR 16 interchange improvements to adequately accommodate future traffic levels and provide accessibility for motorists and nonmotorized travelers.

   GH T-10.2  Overcrossings and undercrossings of freeways should include safe and accessible sidewalks and/or paved shoulders for pedestrian and bicycle traffic.

   GH T-10.3  Pierce County shall coordinate with the WSDOT concerning the provision of adequate roadway improvements to accommodate changes in traffic patterns related to the proposed Narrows interchange at 24th/36th Street NW and any other interchange revisions.

   GH T-10.4  Pierce County shall encourage the WSDOT to avoid steep cuts that will not sustain natural growth, and to replant and maintain native vegetation, including shrubs and evergreen trees, on all existing cuts and fills on freeway interchanges where sight distance would not be affected.

   GH T-10.5  Pierce County shall support the dialogue with any community forum for the purpose of discussing local transportation issues and the study of related programs and projects.

   GH T-10.6  Pierce County recommends improvements to SR 302, including rehabilitation of the Purdy spit bridge, operational improvements at the SR 302/SR 302 spur intersection, and establishment of a new SR 302 route in Kitsap County that connects to a reconstructed Burley-Ollala interchange (as proposed in the State Route 302 Corridor Study, WSDOT, August 1993).

UTILITIES POLICIES

SANITARY SEWER AND WASTEWATER

GOAL GH U-1  Pierce County does not provide sanitary sewer or wastewater treatment on the Gig Harbor Peninsula. Pierce County shall support the City of Gig Harbor's efforts to provide sewer service in the Urban Growth Area that accommodates planned urban densities and urban development patterns, consistent with the Countywide Planning Policies.

   GH U-1.1  Pierce County shall advise applicants seeking County building or development permit approval who are also seeking City of Gig Harbor sewer utility services (sewer) to contact the city early in the permit review process for information on city-contracted requirements and utility construction standards.
GH U-1.2 Prohibit new uses that require urban levels of service, such as sanitary sewers, in the Rural Airport designation. Urban levels of service shall be permitted only in the rural area pursuant to code.

GOAL GH U-2 Pierce County and the City of Gig Harbor should coordinate the phased expansion of sewer interceptors within the Urban Growth Area.

GH U-2.1 The City of Gig Harbor should continue to plan for capacity and facilities needed to serve the anticipated growth within its Urban Growth Area.

<table>
<thead>
<tr>
<th>Stormwater</th>
</tr>
</thead>
<tbody>
<tr>
<td>GOAL GH U-3 Provide assistance to property owners for reducing stormwater flows and implementing best management practices.</td>
</tr>
<tr>
<td>GH U-3.1 Consider underground stormwater retention systems by providing development incentives.</td>
</tr>
<tr>
<td>GH U-3.2 Contract with private developers to provide increased capacity to accommodate existing capacity problems/mitigate existing drainage problems.</td>
</tr>
<tr>
<td>GOAL GH U-4 Raise existing improvements above the 100-year floodplain.</td>
</tr>
<tr>
<td>GH U-4.1 Preclude new construction, grading, and filling within the 100-year floodplain.</td>
</tr>
<tr>
<td>GOAL GH U-5 Restrict construction of certain types and sizes during the wet season (October-March).</td>
</tr>
<tr>
<td>GOAL GH U-6 Lower costs to the Surface Water Management Utility for land acquisition by pursuing shared use of County-owned property for the construction of detention/retention facilities.</td>
</tr>
<tr>
<td>GH U-6.1 Inspect and enforce the maintenance of private stormwater facilities. Require that these private facilities function as they were originally intended.</td>
</tr>
<tr>
<td>GH U-6.2 Consider a requirement of retrofitting private stormwater facilities to bring these stormwater systems up to current standards over time.</td>
</tr>
<tr>
<td>GOAL GH U-7 Acquire, enhance, expand, or create wetlands for use in a wetland banking program. Utilize areas for stormwater disposal in conjunction with wetlands creation.</td>
</tr>
<tr>
<td>GOAL GH U-8 Evaluate streams within the plan area for evidence of scouring, erosion, and other evidence of an increase in peak stormwater flows and velocities or a reduction in biological activity.</td>
</tr>
<tr>
<td>GH U-8.1 Develop a prioritization list of habitat improvement projects for the plan area.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Domestic Water</th>
</tr>
</thead>
<tbody>
<tr>
<td>GOAL GH U-9 Encourage the regional management of small water systems on the Peninsula.</td>
</tr>
<tr>
<td>GH U-9.1 Encourage the physical inter-tying of small water systems whenever possible.</td>
</tr>
</tbody>
</table>
GOAL GH U-10  
Mandate water conservation measures for all land uses.

GH U-10.1  
Promote the development of cost-sharing programs to help people purchase low-flow fixtures (e.g., appliances, faucets, and toilets) for their existing homes.

GOAL GH U-11  
Pierce County shall work with the Tacoma Pierce County Health Department to limit new wells and development activities that require water withdrawals in those areas on the Peninsula that have been identified as being at risk for saltwater intrusion. Saltwater intrusion (i.e., chloride levels exceeding 100 mg/L) has been identified through sampling of private wells on Allen Point, Point Evans, Henderson Bay near Kopachuck, Fox Island, Point Fosdick, and Horsehead Bay. The most significant saltwater intrusion has occurred in wells bordering Horsehead Bay.

GH U-11.1  
Promote water conservation measures in the summer months when saltwater intrusion tends to peak as pumping rates are the highest and rainfall (aquifer recharge) is the lowest.

GOAL GH U-12  
Planning and Land Services shall work with the Surface Water Management division of Public Works to identify and protect aquifer recharge areas throughout the Gig Harbor Peninsula through the Kitsap Water Resource Inventory Plan (addressing water supply and availability) for Water Resource Inventory Area (WRIA) #15. Coordinate the planning for WRIA #15 with other planning efforts in Pierce County.

GH U-12.1  
Utilize the WRIA #15 Plan information in future updates to the community plan.

GH U-12.1.1  
Coordinate the WRIA #15 Plan with the Gig Harbor Peninsula Basin Plan (addressing surface water management and capital facilities).

GH U-12.2  
Involve the Gig Harbor Peninsula Basin Advisory Committee in the WRIA #15 planning effort.

GOAL GH U-13  
Request the TPCHD to start a program to prevent septic failures through public education and routine septic checks.

GOAL GH U-14  
Require systems to satisfy current regulations prior to expanding service to additional customers.

GOAL GH U-15  
Explore the feasibility of a regional water supply system.

GOAL GH U-16  
Promote educational programs that provide information to property owners concerning wellhead protection measures.

GOAL GH U-17  
Standardize water monitoring on a regional basis.

SOLID WASTE

GOAL GH U-18  
Explore opportunities to reduce per capita solid waste generation to less than 3.45 pounds per person per day.

GH U-18.1  
Reduce the volume of solid waste by encouraging manufacturers and retailers to reduce packaging waste at the retail level.
GH U-18.2  Implement local, state, and national waste reduction measures.
GH U-18.3  Support local recycling programs and increase participation in the single-family curbside program to 90% and in the yard waste curbside program to 50%.
GH U-18.4  Encourage recycling at multifamily residences by providing information to managers of apartment complexes and to developers on how to size recycling bins to meet code and to provide efficient services.

GOAL GH U-19  Provide opportunities for recycling at transfer locations for the public and commercial haulers.
GH U-19.1  Expand the number and capacity of drop-off and buy-back recycling facilities.
GH U-19.2  Consider a requirement for mandatory curbside solid waste and recycling collection throughout the Peninsula.
GH U-19.3  Encourage the Pierce County Solid Waste Division to work with the haulers and recyclers to develop additional programs, such as conducting a pilot community recycling day or facilities for disposal of hard to handle solid waste such as appliances, tires, used batteries, etc.
GH U-19.4  Work with the local newspaper to regularly promote the location of and the proper use of the free recycling drop-off sites that are located throughout the community.

GOAL GH U-20  Only those waste processing technologies that are protective of human health and the environment (e.g., no adverse odor impacts to neighboring properties) shall be permitted.

GOAL GH U-21  Encourage businesses to accept the return of problem waste (i.e., oil, batteries) from products they sell, for proper disposal.

POWER

GOAL GH U-22  Accommodate natural gas storage facilities within Employment Centers.
GOAL GH U-23  Support the installation of natural gas supply facilities across the Tacoma Narrows to the southern portion of the Gig Harbor Peninsula through the appropriate land use permitting and environmental review process.

IMPLEMENTING ACTIONS

The following is a list of actions that needs to be completed in order to implement the policies contained within the Facilities and Services Element. They are arranged according to the timeframe within which each should be completed: short, medium, or long term. Short-term actions should occur immediately or within one year of plan adoption. Mid-term actions should be completed within 2-5 years. Long term actions should be completed within 5-10 years of plan adoption. The party or parties responsible for leading the effort to complete the action item are listed in parenthesis following the action. Actions are assigned to the Gig Harbor Peninsula Community Planning Board (GHPCPB), the Peninsula Advisory Commission (PAC), or
Pierce County Planning and Land Services (PALS). Those actions assigned to the GHPCPB are completed as part of the adoption and implementation of this plan.

**SHORT TERM ACTIONS**

1. Require urban development standards and urban levels of service as a component of all new development in the Urban Growth Area. If level of service standards are not being met, amend regulations as necessary. (PALS, PWU)

2. Require that new development supports the costs associated with public facility and service expansions that are made necessary by each development project. (PALS, PWU)

3. Ensure that the UGA includes only those areas that are capable of providing urban levels of service over the next 20 years. (PALS, City of Gig Harbor)

4. Require that the level of service (LOS) standards for facilities and services that are adopted in the Pierce County Comprehensive Plan or Gig Harbor Peninsula Community Plan are maintained. (PALS, PWU, T.P.C.H.D)

5. Amend regulations as necessary to allow interim on-site approved septic systems in the UGA where sewer facilities are not available. (PALS, T.P.C.H.D)

6. Facilitate protection and conservation of groundwater supplies contained within the Gig Harbor Peninsula aquifer. (PALS, T.P.C.H.D)
   - Support efforts to establish a water budget for the Gig Harbor Peninsula.

7. Promote reliable and cost-effective solid waste service that is consistent with the Tacoma-Pierce County Solid Waste Management Plan. (PWU)

8. Encourage recycling and a reduction in the volume of solid waste in the community. (PWU)

9. Amend regulations to permit regional electrical and natural gas facilities in the plan area. (PWU)

10. Support expansion of electric utility facilities to meet future load requirements and support conservation measures to aid in meeting future growth needs. (PALS)

11. Support the efforts of Fire District Number Five in responding to the increasing population and demand for services on the Gig Harbor Peninsula. (PALS)

12. Coordinate capital facilities planning with the Peninsula School District. (PALS, PWU)

13. Work with the Peninsula School District to coordinate a schedule for limited community use of the school district facilities. (PALS, PC Parks, Peninsula School District)

**Parks**

14. Require that the level of service (LOS) standards for facilities and services that are adopted in the Pierce County Comprehensive Plan or Gig Harbor Peninsula Community Plan are maintained. (PALS, PWU, T.P.C.H.D)
15. Require that regional parks and recreational facilities are provided within the community plan area that meets the County-wide LOS standard. (PC Parks)

16. Provide opportunities for community involvement in siting and developing the County’s regional park system on the Gig Harbor Peninsula. The Pierce County Parks Department should forward park improvement recommendations to the PAC. (PC Parks, PAC)

**Transportation**

17. Require that the level of service (LOS) standards for facilities and services that are adopted in the Pierce County Comprehensive Plan or Gig Harbor Peninsula Community Plan are maintained. (PALS, PWU, T.P.C.H.D)

18. Annually consult with the Peninsula School District to prioritize safety improvements near schools and established bus stops. (PALS, PWU, Peninsula School District)

19. Ensure that transportation facilities are developed in a manner that will not encourage or promote growth or development beyond the UGA. (PALS, PWU)

20. Require that new roads are designed and constructed in a manner that minimizes impacts to streams, wetlands, wildlife habitat, and other critical areas. (PALS, PWU)

**Mid-Term Actions**

1. Work with the City of Gig Harbor in ranking possible sites for planned public facilities and services using a priority system. (PALS, City of Gig Harbor)

2. Coordinate the provision of urban services and utilities within the Urban Growth Area.

3. Develop a joint planning agreement with the City of Gig Harbor addressing urban services and facilities within the Urban Growth Area. This agreement should address the following: (PALS, City of Gig Harbor, PC Council)
   - Standards for determining the adequacy and availability of public facilities and services.
   - A process for coordinating the expansion of public facilities and services.
   - A process for coordinating capital improvement projects within the UGA.

4. Pursue planned actions within the UGA pursuant to WAC 197-11-165, 197-11-168, and 197-11-172. (PALS, City of Gig Harbor)

5. Utilize the results of the Pierce County Conservation District’s (PCCD) survey of fish passage barriers that has been prepared for the Gig Harbor Peninsula and prioritize correction of any barriers in the next Capital Improvement Program (CIP) update. (PALS, PCCD, PWU)

6. Coordinate the phased expansion of sewer interceptors within the Urban Growth Area. (PALS, PWU, City of Gig Harbor)
7. Amend development regulations to provide standards that establish near zero change in hydraulic and hydrologic function on a property after development. (PALS, PWU, PAC)
   - Implement low impact site development techniques.
   - Revise existing development standards when the standard does not adequately prevent new development from increasing surface water drainage problems or where the standard does not eliminate the possibility of damage from storm events.

8. Review existing allowable limits of impervious surface against the best available science to determine the adequacy of these standards. (PALS, PWU, WSDOE)

9. Implement programs to reduce impacts associated with stormwater runoff in the plan area. (PALS, PWU)
   - Evaluate streams within the plan area for evidence of scouring, erosion, and other evidence of an increase in peak stormwater flows and velocities or a reduction in biological activity.
   - Develop a prioritization list of habitat improvement projects for the plan area.
   - Provide assistance to property owners for reducing stormwater flows and implementing best management practices.

10. Amend and adopt regulations that integrate stormwater detention and retention facilities into the natural environment. (PALS, PWU)

11. Develop and adopt an enforcement and maintenance program for private stormwater facilities. (PALS, PWU)

12. Study a regional water supply system on the Gig Harbor Peninsula. (PALS, T.P.C.H.D)

13. Prohibit new individual wells within the Urban Growth Area. (PALS, T.P.C.H.D)

14. Prohibit new wells on sites that are at high risk for saltwater intrusion, unless it can be demonstrated through a hydrogeologic assessment that additional groundwater withdrawal will not worsen the problem in the vicinity. (PALS, T.P.C.H.D)

15. Amend the Capital Facilities Plan to adopt a level of service, based on the number of on-duty commissioned officers in the community, which would more accurately reflect the true level of service in the community. (PALS, PC Sheriff, PC Council)

16. Work with the Peninsula School District to determine if impact fees for schools are adequate to mitigate the impacts to the facilities that are generated by new residential growth within the community plan area. Amend the school impact fee ordinance if necessary. (PALS, PC Council, PAC)

Parks

17. Acquire property that will contribute to the community-wide system of parks, recreational facilities, trails, and open space. (PC Parks, PALS, PCCD, Land Trust, PPRD)
18. Work with the various park and recreation providers on the Peninsula to provide community park facilities throughout the plan area. (PC Parks, PALS, PCCD, Land Trust, PPRD)

19. Work with the various park and recreation providers on the Peninsula to provide a system of neighborhood parks in the community. (PC Parks, PALS, PCCD, Land Trust, PPRD)

20. Require subdivision parks in all new residential developments unless a fee in lieu of park dedication is provided. (PC Parks, PALS)

21. Work with the various park and recreation providers on the Peninsula to provide a community-wide system of trails that will serve park, recreation, and open space needs. (PC Parks, PALS, PCCD, Land Trust, PPRD)

22. Work with the various park and recreation providers on the Peninsula to develop indoor and outdoor recreation facilities throughout the community at regional, community, and neighborhood parks and at school sites. (PC Parks, PALS, PCCD, Land Trust, PPRD)

23. Acquire open space tracts for passive recreation including shoreline access and wildlife viewing. (PC Parks, PALS, PCCD, Land Trust, PPRD)

24. Acquire shoreline access points whenever possible. (PC Parks, PALS, PCCD, Land Trust, PPRD, DNR)

25. Prohibit the vacation or trading of unopened public rights-of-way at shoreline locations except when the vacation or trade would enable a public authority to acquire the vacated property for public purposes. (PWU, PALS)

26. Work with the City of Gig Harbor, the Peninsula School District, the Peninsula Park and Recreation District, the Peninsula Park and Recreation Council, and other interested citizens in providing park and recreational facilities in the community. (PC Parks, City of Gig Harbor, Peninsula School District, PPRD, PPRC, PAC)

- Pierce County Parks Department should provide the various park and recreation provider’s technical expertise in site planning and facility needs assessments.
- Pierce County Parks Department should provide assistance in the preparation of grants for property acquisition, operation, and maintenance.
- Pierce County Parks Department should work with the Peninsula School District to coordinate a schedule for limited community use of the school district facilities.

27. Adopt rules that allow developers to offer a payment in lieu of park land dedication when they are developing subdivisions. (PALS, PC Parks)

28. Develop park facilities that generate funds. Incorporate revenue collection into the design of new parks. (PALS, PC Parks)

29. Charge user fees at sites that provide recreational opportunities at a rate that will support the facilities maintenance and operating costs. (PC Parks)
Transportation

30. Work with Pierce Transit to develop a transit system to serve the internal and external travel needs of Peninsula residents. (PALS, PWU, PC Transit)

31. Implement transportation demand management programs. (PALS, PWU, PC Transit)
   - Assist Pierce Transit and other agencies in evaluating boundary and service extensions, additions, and revisions.
   - Implement programs that encourage carpooling, bicycling, walking, transit usage, telecommuting, and compressed work-weeks.
   - Examine the possibility of requiring developers of employment sites to implement transportation demand management measures.
   - Consider providing developers with incentives or credits for implementing transportation demand management measures.

32. Pursue the expansion of the existing park and ride lots and development of new lots in the regional park and ride lot system. (PALS, PWU, PC Transit)

33. Require that new and reconstructed arterial roadways within the UGA are provided with curb, gutter, and sidewalks and facilities to accommodate bicyclists. (PALS, PWU)

34. Pursue consistent short and long-term transportation planning in the UGA. (PWU, City of Gig Harbor, WSDOT)

35. Explore joint funding of transportation projects when viable, including application for state and federal grants.

36. Study the viability of developer impact fees for funding transportation improvements within the Gig Harbor Peninsula Community Plan area. Create an impact fee ordinance to fund transportation improvements if feasible. (PALS, PWU, PC Council, City of Gig Harbor)

Long Term Actions

1. Implement adaptive management strategies based upon the information received from groundwater monitoring programs. (PALS, T.P.C.H.D)

2. Monitor and evaluate projects that utilize LID standards to determine the effectiveness of the established goals. (PALS, PWU)

3. Implement the changes to the stormwater regulations identified in this Element in the next substantive revision to the County’s Stormwater Management and Site Development Manual and related regulations. (PALS, PWU)
Gig Harbor Community Plan

Park Acquisition Recommendations

Chapter 7: Plan Monitoring

**Purpose**

The 1990 State Growth Management Act (GMA) requires jurisdictions planning under GMA to report on progress made in implementing the Act, and to subject their comprehensive plans to continuing evaluation and review. As part of the County’s Comprehensive Plan, the Gig Harbor Peninsula Community Plan is subject to this requirement. One mechanism for conducting this evaluation and review is to monitor the development standards, regulations, actions, and other programs called for in the plan for the purpose of determining their effectiveness in fulfilling the vision of each of the six elements of the plan.

This section provides a framework both for monitoring the various actions undertaken to implement the plan and for offering recommendations to make adjustments to the actions in order to achieve the vision of the plan. Actions may include the development and implementation of regulations and design standards, working with the City of Gig Harbor to coordinate the provision of facilities and services, developing educational programs and handouts, acquiring parks, preserving open space, and other actions. This framework for monitoring provides a means for measuring the effect of each action, identifies participants and their roles in monitoring the actions, lays out time frames for monitoring, and specifies how the monitoring program should be documented. Information obtained from the monitoring program will be used to offer recommendations to decision makers as to what changes to the community plan may be needed in order to attain specified goals and meet the visions in the plan.

**How to Measure the Effect of Standards**

The Gig Harbor Peninsula Community Plan identifies actions that need to be implemented to meet its vision, goals, objectives, principles, and standards. Monitoring evaluates the effectiveness of the actions in fulfilling the plan policies. The monitoring program outlined here includes several steps which are intended to identify actions taken, the ease with which they can be used, and whether the actions actually meet the objectives they were intended to achieve.

To do this, the monitoring program is divided into five steps: Actions, Inputs, Process, Outputs, and Outcomes. Each of the steps and the responsible participant are discussed briefly here.

**Phase 1 – Actions:**

Phase 1 monitoring would consist largely of reviewing the policies and standards stated in the plan and identifying all the actions that need to be undertaken to be consistent with the plan. The actions should be grouped according to the objectives they are intended to meet. PALS staff and the Peninsula Advisory Commission (PAC) would be the primary participants in this activity.
**PHASE 2 - INPUTS:**

Phase 2 monitoring would determine whether actions called for in the plan have actually been undertaken and completed. PALS staff would evaluate if regulations and design standards have been adopted. Review to determine if other actions have been completed and could be done by the PAC or other County departments.

**PHASE 3 - PROCESS:**

Phase 3 monitoring would evaluate whether an action is straightforward, understandable, or easy to use. In the case of regulations and design standards, those persons who have submitted permit applications requiring compliance with the regulations and design standards would need to be involved in the evaluation. The Pierce County Hearing Examiner and the PAC, which review such applications, as well as PALS staff, would need to be included in the monitoring. PALS staff would coordinate the monitoring and could conduct interviews or distribute questionnaires to persons who have submitted or reviewed permit applications subject to the regulation being monitored.

**PHASE 4 - OUTPUTS:**

Phase 4 monitoring would determine whether the action has been carried out as stated in the plan. For example, monitoring would determine whether a regulation or design standard has been complied with and identify reasons for any noncompliance. In regard to non-regulatory activities, monitoring would determine whether the objectives of the activity have been met. Participants would include residents, property owners, the PAC, and PALS staff.

**PHASE 5 - OUTCOMES:**

Phase 5 monitoring would evaluate the extent to which each action results in the desired effect on the community. The primary participants are the residents and property owners in the plan area. Assistance would be provided by the PAC and PALS staff. PALS staff would assist in organizing public meetings, preparing and distributing questionnaires, and using other means to gather this information.

**TIMELINE**

It is anticipated that the Gig Harbor Peninsula Community Plan will take a substantial period of time to be implemented. There are a number of actions that can be accomplished within a short timeframe, some will take much longer, and others will involve ongoing actions with no specific completion date. It is important that monitoring be done on a continuing basis with specific actions monitored at different times.

In regard to monitoring the development and implementation of regulations and design standards, it would be appropriate for monitoring to be phased over time as the five phases...
Outlined above are accomplished. Phase 1 would begin almost immediately upon the plan adoption. Phase 2 would take place within two years following the plan adoption. This would provide adequate time for the County Council to adopt implementing regulations called for in the plan. Phases 3, 4, and 5 would occur within two to three years following completion of Phase 2. This would allow time for the regulations to be applied to a number of development projects. Phase 3 analysis of how understandable the regulations are, and the ease to which they can be applied, would then be based on the application of the regulations to those projects developed within that time period. Phases 4 and 5 monitoring would be done simultaneously with Phase 3 monitoring. The total time for initial monitoring for Phases 1 through 5 would be about five years. As changes are made to regulations and design standards, the monitoring cycle would need to be repeated to address the changes.

Other actions that do not involve the implementation of regulations or design standards would be monitored on a similar timetable. Phase 1 and Phase 2 would occur within two years of adoption of the plan, while Phase 3, 4, and 5 monitoring would occur within five years of plan adoption.

As amendments are made to the plan, monitoring would need to continue to determine how effective the changes are in carrying out the goals in the plan. In addition, it would be appropriate to continue monitoring all actions in the plan every five years to evaluate whether the actions continue over time to effectively carry out those goals.

**Documentation**

A review of baseline information is necessary to effectively monitor whether the goals of the Gig Harbor Peninsula Community Plan are being met. Information regarding community attitudes, visual characteristics of the community, community services, infrastructure, business climate, land uses, permitting activity, and other community characteristics would be evaluated.

As each phase of monitoring is completed, a report should be prepared by PALS staff which identifies the action being monitored, the specific purpose of the monitoring, methods used in monitoring, data collected, analysis of the data, and recommendations for further action. The report should be submitted to the PAC for review and comment and to the County Council for its consideration.

**Recommendations for Further Action**

In addition to determining the effectiveness of the plan in fulfilling the goals of the community, a key component to monitoring would be the recommendations for further action. These recommendations should clearly identify the specific goals being addressed, how the recommended action corrects a deficiency in the plan, how the recommended action will contribute to fulfilling the goal in question, and a timeline for completing the proposed action.
The Graham Community Plan’s narrative text and policies are in addition to the Countywide Comprehensive Plan narrative text and policies and are only applicable within the Graham Community Plan Boundary.

- “Current” or “Existing” conditions are in reference to conditions at time of adoption (Adopted Ord. 2006-52s, Effective 3/1/2007).
- “Proposed” or “Desired” conditions are those which required Council action and may have also been amended over time through a Comprehensive Plan Amendment (amendments are reflected in this document).

Chapter 7: Plan Monitoring ................................................................. F-217
Chapter 1:  Introduction

GREATER GRAHAM COMMUNITY

The greater Graham area in Pierce County has experienced a significant amount of growth during the past several decades. Some of this growth has been at the expense of the areas’ rural atmosphere. Pierce County and representatives from the community have identified a community vision, discussed issues and created policies that will assure sensible and appropriate levels of development within the plan area over the next 20 years.

The result of this work is the creation of a community plan that provides a framework for consistent land use standards in both the urban areas and in the outlying rural and natural resource lands. Higher density and intensity development is directed into urban areas, where it can be supported by urban level services and facilities. This also allows rural and natural resource areas to retain the low density, agricultural, and forested character that the community values.

GENERAL DESCRIPTION OF THE PLAN AREA

The Graham Community Plan area is located in south central Pierce County at the fringe of the County’s urban growth area limits. The plan area is bounded by the communities of Spanaway, Frederickson, and South Hill to the north. The northernmost limits range from 208th St. E. at the western edge up almost to 176th St. E. at SR 161 (Meridian Avenue). SR 7 (Mountain Highway) is located along the western boundary of the plan area and 352nd St. E. represents the southern boundary. The plan area extends as far east as the Puyallup River Valley. The intersection of 264th St. E. and SR 161 is roughly the geographic center of the plan area.

The plan area is approximately 76.5 square miles in size and encompasses almost 49,000 acres of urban, rural and natural resource lands. Many small, distinct communities are located within the plan area including Graham, Elk Plain, Kapowsin, Thrift, and Rocky Ridge, and some plan area residents associate themselves with other neighboring communities such as Eatonville and Orting. Major north/south transportation routes within and adjacent to the plan area include Mountain Highway, SR 161,
which bisects the center of the plan area, Webster Road and the Orting-Kapowsin Highway. The main east/west access routes through the plan area are 224th, 304th, and 352nd Streets E.

While a small portion of the northern plan area is located within the County’s Urban Growth Area boundaries, the majority of the plan area is very rural in character with rolling pasturelands, timberlands and low density rural residential housing. There are many unique environmental features within the plan area including a myriad of lakes and a complex system of rivers and creeks, many of which are salmonid bearing. These systems also support a variety of wildlife species. Morse Nature Preserve, located at the headwaters of Muck Creek, provides an excellent opportunity within the plan area for bird watching and educational events.

**GROWTH TRENDS, POPULATION AND DEMOGRAPHICS**

**GROWTH TRENDS**

During the years between 1990 and 2000, the Graham plan area had a higher percentage of population growth than the surrounding communities and Pierce County as a whole. The following is an example of the comparative growth (expressed in percent) from 1990 to 2000 between the plan area and other areas:

- Graham - 58%
- South Hill - 44%
- Frederickson - 52%
- Pierce County (incorporated and unincorporated) - 20%

**CURRENT POPULATION**

The year 2000 population within the plan area was calculated at 32,513 people. Of the total plan area population, it is estimated that 2,837 of those people reside inside the Comprehensive Urban Growth Area (CUGA) boundary while the remaining 29,676 residents live in either designated rural or natural resource areas.

**TWENTY-YEAR POPULATION FORECAST**

Population forecasting is an inexact science. A number of different assumptions are put into population models in an attempt to predict what the population will look like in the future. Another layer of complexity is added to this task when considering the implementation of social policies, such as the Growth Management Act, and determining how they may affect growth. To acknowledge these differences, the projected population growth between the years 2002 and 2022 for the Graham plan area is estimated between 6,700 and 13,000 people.
The lower population projection is a product of the Pierce County Population Allocation process. Through this process, substantial emphasis is placed on the urban growth policies adopted in cities’ and towns’ comprehensive plans that have the effect of redirecting growth back within city limits. The accuracy of this low range relies on the success of implementing those policies. The higher estimate results from the same modeling process; however, the results were not further refined to incorporate cities’ and towns’ policies. In general, the exclusion of these policies from the forecasting process generates higher growth estimates in urban and rural areas of unincorporated Pierce County.

Demographics

Demographics for the plan area were compiled from information contained within the year 2000 U.S Census survey. The following nine census tracts encompass the plan area and were used to derive the demographic information; 731.07, 731.09, 731.13, 731.14, 731.15, 731.16, 731.17, 731.18, 731.19.

The age of the population within the plan area is generally younger than Pierce County’s average. Approximately 62 percent of the population is between 18 and 65 years of age, while 31.4 percent of the population is under the age of 18. The County as a whole has roughly 27 percent of its population under the age of 18.

The income characteristics indicate the households in the plan area have a higher income level than Pierce County as a whole. The median household income for Pierce County is approximately $45,200 and 64 percent of the households in the plan area have an income of $45,000 or higher. Roughly 10 percent of the households within the plan area have an income less than $20,000 and approximately 11.6 percent have an income level of $100,000 or higher.

History of the Plan Area

Early History through the 1900s

Pre-1850s

Before the 1850s, the Graham and Kapowsin areas were largely forested and the Elk Plain area was a vast prairie. Native Americans inhabited these areas for thousands of years and maintained a fire regime to help foster the oak woodland and prairie areas. The community planning area was part of the traditional lands of the Nisqually and Puyallup Indian Tribes. The Puyallup villages were located near the northeastern portion of the community planning area. The Nisqually people considered the area a major part of...
their “bread-basket” as the area was teeming with fish and wildlife and the prairies provided nuts, roots and other edible plants. The variety of resources was also used for shelter, clothing and other household provisions. The Nisqually people called Kapowsin Lake “Tuh-powt-se,” Muck Creek “Y’ll-whaltz,” and Orting Prairie “Tu-wa-quotes.”

Also prior to 1850, Elk Plain was utilized by the Hudson’s Bay Company as a grazing area and its employees lived in the Muck Creek Area. In 1850, the Donation Land Claim Act was passed by U.S. Congress. The only donation land claim within the community plan area was filed by John McCloud for 320 acres near Muck Creek. Prior to this, Native Americans used the site as a summer campground. John McCloud married a local Native American woman and had a daughter. Some of their descendents still live in the area.

### 1850s – 1900

In 1862, The Homestead Act was passed by U.S. Congress bringing more settlement into the area. The area was still largely forested with huge trees and it took months to clear an acre of land. Some of the first settlements included the Peter Leber Settlement, the first post office in 1884, and the Barling Place, which raised and sheared sheep for wool. The cultivation of hops as a cash crop was widespread in the area until 1890 when hops lice devastated hops production.

During this time many school districts, often one-room schools, were formed and churches were constructed to serve new parishes. Newly formed school districts included: Muck Creek/Oak Knoll School District (S.D.) No. 5 in 1859; Spanaway S.D. No. 6 in 1860; Spanaway S.D. No. 25 in 1882; Kirby S.D. No. 49 in 1888; Thrift S.D. No. 41 in 1891; Rocky Ridge S.D. No. 59 in 1891; and Elk Plain S.D. No. 80 in 1892. In 1898, Bethany Lutheran Church was constructed.

Railroads played an especially important role in shaping the character and pattern of development in the plan area. Railroads were brought through the hinterlands of Pierce County to reach the areas where natural resources such as timber, coal, and mineral resources were extracted. They also provided transportation for livestock and farm products and milled wood products. Tacoma Eastern Railroad was extended in 1900 to Frederickson, Graham, Thrift and Tanwax Junction. In 1901, the railroad reached Kapowsin and by 1904 the line was extended to Elbe and Ashford.

From an early period, Mountain Highway (SR 7) and Meridian (SR 161) were the two main north-south thoroughfares that connected the rural communities located within the plan area to the bigger cities and towns. In the 1890s, Mountain Highway was a country road, extending southward through prairie and into a forested area at Benston’s Hill after crossing Muck Creek. In the early 1900s, daily horse-drawn stage coaches traveling on the road from Tacoma to Ashford passed by Elk Plain. Webster Road and many other roads in the area were also constructed during the 1880s and 1890s.
The Early 1900s through the Early 1950s

1900 – 1920s

During the early 1900s, many logging camps were established in the eastern portion of the plan area at Kapowsin and along the Tacoma Eastern Railroad line and logging mills sprang up along the shores of Lake Kapowsin. By mid-1906, five shingle or saw mills were in full operation at Lake Kapowsin, 23 mills were in full operation along the Tacoma Eastern railroad line, and several additional mills were under construction.

The Electron Hydropower Plant was also constructed and went into service in 1904. Electron was the first major hydroelectric project in Pierce County and the largest in the state at the time.

Mountain Highway became one of the first concrete paved highways in the state largely due to the extraordinary efforts of Torger Peterson, an early settler of the Ohop Valley. By the fall of 1926, 49 miles of highway from Tacoma to the Mt. Rainier park entrance was paved with concrete.

Farming continued to flourish in the plan area during the early 20th century. Most farmers tended chickens, cows, and vegetable gardens and logged timber for their livelihood. Granges were organized in the 1920s to promote farmers' interests in taxation, water and utility provisions, pricing, distribution, and transportation issues. They also provided for agricultural research, education, and as community gathering places for social and family activities and events. During this time period the following granges were established.

- Loveland Grange No. 782, May 23, 1921, later renamed Elk Plain Grange No. 782.
- Thrift Grange No. 804, 1921, rechartered to Kapowsin Grange No. 804.
- Benston Grange No. 892, November 5, 1928, later consolidated with the Elk Plain Grange.

1930s – 1950s

By the 1930s through 1950s timber mills were starting to decline due to dwindling timber resources. Some mills, such as the one in Harding, that were burned in fire accidents were not
replaced. As logging activity decreased, so did employment in the area. Former loggers and sawmill workers had to find work elsewhere. During this time many plan area residents began commuting to work in Tacoma, DuPont, Fredrickson, and other urban centers.

Much of the existing road network within the plan area was constructed by this time period and tourism on Mountain Highway to Mt Rainier became more active. Some of the earlier roads included the Orting-Southern Road which later became Orting-Kapowsin Highway, L. C. Tallman Road (158th Ave. E.), Mathias-Webster Road, Eustis Hunt Road East, Muck-Kapowsin Road (224th St. E.), Thrift Extension Road, McDonald Road (264th St. E.), and the Graham Farm-to-Market Road (Meridian [SR 161]).

During 1945 planning for the area’s first park (Frontier Park) began. The St. Paul and Tacoma Lumber Company was persuaded to donate 20 acres of land just north of Graham, with the proviso that it be used as a park. The first picnic was held there that same spring. The local residents donated labor and funds to make improvements to the land. Soon the field was prepared for baseball and other activities. By 1952, the Rainier Riding Club was given permission to use some of the park’s space to create a quarter mile track and other improvements.

**THE 1950S THROUGH THE 1970S**

During post-World War II, farming continued within the plan area including berries, cherries, bulbs such as daffodils and tulips, poultry farms and dairy farms. Logging and timber mill production dwindled but plywood milling was introduced and became established in the plan area. During the 1960s, residential growth started expanding.

In May 1963, a Board of Directors for Frontier Park was created and incorporated under the new name. In 1967, the Pierce County Fair Board was invited to hold its annual fair at the park and the board accepted. The fair moved from Sumner to Frontier Park in August 1968. The Pierce County Fair has remained at the park since that time. It remains one of the sources of community pride.

**THE 1970S THROUGH PRESENT**

During the 1970s through the early 1990s, the plan area experienced a building boom in residential housing, including mobile home placement. Zoning within the plan area was General, which allowed for virtually all uses. Crime also increased during this time period and police protection became an important issue.

In 1994, the County adopted the Pierce County Comprehensive Plan. This plan designated most of the plan area as rural with low residential densities permitted. Commercial areas within the plan area were contained within designated Rural Activity Centers (e.g., 224th St. E. and Meridian) and Rural Neighborhood Centers. Further commercial sprawl down Mountain Highway and Meridian was stopped by defined centers and rural zoning.
## Individual Community Histories

### Benston

Benston was originally called Huntersville. The name was changed in 1892 to honor local citizen Adam Benston, an employee of the Hudson’s Bay Company, who later served as a mail carrier. The Benston School District split from the Muck District in 1878 and operated until 1930 when it merged with the Kapowsin District. Benston was an agricultural community raising crops such as wheat, oats, and barley, and livestock for beef and dairy products.

### Electron

Electron was the first major hydroelectric project in Pierce County and the largest in the state at the time it was constructed. When the construction of the facility was at its peak, the project employed between 1,500 and 2,000 workers who were stationed in “camps” at the various project sites. The Electron [Hydroelectric] Plant went into service in 1904. The Electron Plant became part of a power distribution system that included Snoqualmie Falls (1898), White River (1911), the Georgetown Steam Plant (1906), Nooksack Falls (1906), the York Street Stream Plant in Bellingham, gas properties in Bellingham and coal mines in Renton. A 300 mile long 55,000 volt transmission line connected these systems and provided a regional power supply system in the Puget Sound area.

The importance of the Electron Plant has been diminished by the development of other power sources in the area over the past decades. However, the Electron dam and powerhouse were still operational in 2004 and celebrated its 100th anniversary with nearly 60 employees and retirees.

### Elk Plain

Elk Plain got its name from the herds of elk that grazed the prairie area. Native Americans who inhabited the area kept the land open for grazing through regular burning of the area. By the mid-1840s, the Hudson’s Bay Company used Elk Plain as a grazing area for their estimated 6,000 sheep and 3,500 head of cattle. The former Puget Sound Agricultural Company land was not open to settlers until Washington Territory and Pierce County could purchase the land for $750,000 in 1867 after a long court battle over the sale price. Early industry included a sawmill that used to be located at about 240th St. E. Some of the pioneer families included Beattie, Ockfen, Wright, Moe, Theil, Rohr, Ehlers, Fisher, Kinsman, and Fuchs. Many of their descendents still live in the area.

The Elk Plain School District was created in 1892 on land donated by S. E. “Amos” Moe. A two-room schoolhouse was built on the site where Elk Plain Elementary is located today. In 1901, the Elk Plain Café was built as a gas station and roadside café. Within a couple of years, cabins were added in back for weary tourists traveling on the road to the mountain.

Loveland Grange No. 782 was formed in 1921. This grange was started by local residents who wanted to form an organization for mutual support in seeking fairer compensation for their properties when the local area was condemned for the construction of Camp Lewis, which
began in 1917. The grange meetings also led to the formation of the Loveland Mutual Light Company. The company’s interests were sold in 1971 to what is now Tacoma Public Utilities. Elk Plain School District No. 80 was consolidated into Bethel School District No. 403 in 1949.

### Graham

Around 1900, Smith Graham, foreman for the Cascade Timber Company, was among the first who started harvesting timber in the area. In the early 1900s, the Tacoma Eastern Railroad (later the Milwaukee Railroad) built tracks from Tacoma through Frederickson, Harding, Graham, Thrift, Tanwax Junction, Kapowsin, and Elbe. The railroad and lumber companies established mills and logging camps in the Graham area. Graham was a necessary stop for the trains transporting lumber to mills located in Kapowsin.

Between 1905 and the 1960s a variety of businesses operated in the community such as a shingle mill, barbershop, blacksmith shop, feed and supplies, auto and tractor repair shop, tavern, restaurant, cold storage lockers, and a meat market.

### Harding

The settlement of Harding was a railroad stop and mill site located along a spur line adjacent to the Tacoma Eastern Railroad right-of-way. It was located one mile west of present-day Graham and was named after Henry and Charles Harding, the first mill operators at that place. With a mill operating in the community and active logging operations in the vicinity, Harding was a small but thriving community from the 1900s to 1920s, complete with a store, boarding house, dance hall, cookhouse, and several smaller homes. In its heyday, an interesting addition was the Japanese village, which consisted of neatly kept homes admired by the community.

### Kapowsin

The community settled by Euro-Americans in 1888 got their start through the booming logging industry like many other small communities in the southern portion of the County. The name of the community is likely to have been derived from the Native American name Kapousen which means “shallow place” and was also the name of the leader of the local Native American band that lived along the lakeshore.

From 1888 to 1929 the rise and growth of Kapowsin was tied inextricably to logging, milling, and railroads. The Kapowsin Post Office opened in 1890. The Tacoma Eastern Railroad reached the area from Tacoma in 1901 and was joined later by the Northern Pacific Railroad to transport timber resources harvested from the area. The first sawmill in Kapowsin was built by the Kapowsin Lumber Company in 1901. By mid-1906, five mills were in full operation on the lake - two shingle mills and three lumber mills.
By 1915, Kapowsin was a thriving community with an estimated population of 750. It had a vibrant business section that served the community that included a restaurant, café, theater, three general stores, two churches, telephone and telegraph office, bakery, bank, laundry, hotels, and doctor’s office. Electricity was provided to the community as early as 1905 by the Electron Power Plant. Samuel Fix installed a water system from 1913 to 1914. A very small four-room school was built in late 1904. Later, a much bigger school building was built which housed students from grade one through twelve with an average student population of 280 students. Its first high school class graduated in 1914. A major gymnasium, which included a swimming pool, was built in 1922. The gymnasium was considered the finest in the County at the time.

By 1928, logging in Kapowsin was in sharp decline because much of the surrounding timberland had been cleared. Workers in the logging industry and those who served their needs started to move on. Most of the mills closed down except one. The demise of the community accelerated in 1928 when the City of Tacoma, which coveted Kapowsin Lake for a municipal water supply, announced plans to acquire considerable land around the shores of the lake. The city announced its plans to purchase the mills, stores, homes, churches, and any other standing buildings and level them. However, the City soon discovered a major artesian source of water in South Tacoma and no longer needed the water from the lake, which required transporting water 25 miles to the City.

By 1930, Kapowsin reverted back to being a rural farming community. Kapowsin School District continued to provide a sense of civic identity. Eventually, Kapowsin School District was consolidated with Bethel School District in 1949. The influx of new residents seeking the quiet solitude of Kapowsin Lake has been gradual. Kapowsin is now a community of a variety of residents engaged in dairy and fruit farming, logging, and recreational fishing, in addition to retirees.

**Kirby**

Kirby was a small sawmill camp on the Tacoma Eastern Railroad, 14 miles southeast of Tacoma. The railroad reached there in about 1900. There was no village at Kirby. It was a train stop from which lumber was hauled to Tacoma. The North Star Lumber Company built a mill in about 1908 and in 1912 the mill was bought by the Kirby Lumber Company. The mill burned in 1913. At the time, there were 55 men employed at the mill. Kirby was also the site of a small schoolhouse.

**Leber**

Leber, a small community located about 340th St. E. and Mountain Highway, included the old Weyerhaeuser Elementary School, a fire station, and a small grocery and gas station. This is one of the oldest communities in Pierce County. The Leber Post Office was established in 1884. It was named after an early settler, Peter L. Leber, who served as the first postmaster. Mr. Leber’s small log cabin served as the original post office. His home site still contains several of the rough hewn cedar out-buildings he constructed. A train route was extended from Tanwax Junction through Leber and on to the Silver Lake area lumber mills in the early 1900s.
**ROCKY RIDGE**

Rocky Ridge is an area from approximately 260th St. E. over the North Fork of Muck Creek to the ridge of Muck Creek hill and between 8th Ave. E. (Pole Line Road) and Webster Road. The current Rocky Ridge Elementary School is located on part of the William Benston Sr. family homestead. The original Rocky Ridge School District used a one room schoolhouse from 1910 to 1949 when it was consolidated into the Bethel School District. The history of settlement in the area extends back to the days of Fort Nisqually.

**TANWAX JUNCTION**

Tanwax Junction was a creation of the railroad and logging industries which flourished in the area from 1901 to 1928. It did not begin as a residential community but as a railroad switching station serving the Tacoma Eastern Railroad, as well as the spur lines of the Tan wax and Western Railway and the Tide Water Lumber Company. It was located on the flat plain above the bustling logging community of Kapowsin, just off the now Orting-Kapowsin Highway. The Junction may also have met the immediate needs of the logging industry by serving as a small collector point for railroad cars hauling logs to the Tacoma logging mills.

**THRIFT**

The first homesteaders of this area arrived in the 1880s. The settlement dwindled in the late 1890s but increased in size after 1900 with the arrival of the Tacoma Eastern Railroad. The Thrift family arrived in 1903. Earlier the railroad stop located in the area was called Summit due to the steep grade the logging trains had to ascend. The name was changed to Thrift to avoid confusion with another community called Summit located near Puyallup. Thrift was an early logging site and hop growing area near the turn of the century.

The first store in Thrift was called Edmans Corner. It was located on the corner of Orting-Kapowsin Road and Muck-Kapowsin Highway (224th St. E.). After being sold a couple of times, it was renamed the Thrift General Store. The first two-room Thrift School was built across Muck-Kapowsin Highway from the store. Thrift School District No. 41 organized in 1891 was consolidated into Kapowsin School District No. 347 in 1949.

**PLANNING HISTORY**

Pierce County has been conducting comprehensive planning and regulating land use for over four decades. The following is a brief description of the major planning efforts initiated within Pierce County during this time period.

**COUNTY PLANNING**

**1962 PIERCE COUNTY COMPREHENSIVE PLAN AND ZONING**

The first Pierce County Comprehensive Land Use Plan and the Pierce County Zoning Code were adopted in 1962. Zoning districts were established that dictated the appropriate location for
commercial business and residential homes. However, the 1962 plan did not offer much protection from incompatible uses nor recognize the unique individuality of communities. Under this plan, most of the plan area was zoned General, which allowed a variety of use types and higher levels of residential density than what is currently allowed in the rural and resource zones.

1994 PIERCE COUNTY COMPREHENSIVE PLAN

The Growth Management Act (GMA) was passed by the Washington State Legislature in 1990. This legislation required Pierce County to engage in countywide planning with the cities and towns located within Pierce County and to update its existing comprehensive plan and development regulations in conformance with the requirements outlined in the new law.

In 1991, Interim Growth Management Policies were adopted as a transition between the 1962 Comprehensive Plan and the new planning required under the GMA. The Pierce County County-Wide Planning Policies were adopted in 1992, which provided the framework and process by which Pierce County and the cities and towns within the County established urban growth areas, provided infrastructure and services, and preserved agricultural and natural resource lands.

In 1994, per the requirements of the GMA, Pierce County adopted a new Comprehensive Plan, which replaced the 1962 Pierce County Comprehensive Plan in its entirety. This plan established population projections, urban growth areas, rural areas and natural resource lands. The new Countywide plan became effective January 1995, with its implementing development regulations becoming effective July 1995. The majority of the plan area was redesignated to rural as a result of the 1994 Comprehensive Plan.

COMMUNITY PLANNING

Although the GMA does not require comprehensive plans to provide for community plans, Pierce County Ordinance No. 90-47s directed County officials to prepare a community plans element of the Comprehensive Plan. The Comprehensive Plan community plans element identifies which communities will receive a community plan; provides the framework for community planning; and establishes the flexibility for communities to refine comprehensive plan land use designations and associated densities and apply design standards to achieve a local vision, while remaining consistent with the Comprehensive Plan and the GMA.

Since 1994, several community plans have been adopted throughout unincorporated Pierce County including the Upper Nisqually Valley, Gig Harbor Peninsula, Parkland-Spanaway-Midland (PSM), South Hill, Frederickson and Mid-County. The majority of unincorporated County residents now live in community plan areas.
SCOPE OF THE COMMUNITY PLAN

LEGISLATIVE AUTHORITY TO DEVELOP THE PLAN

The 1994 Pierce County Comprehensive Plan Community Plans Element identifies Graham as an area to receive a community plan. In 2001, the County Council authorized the initiation of a community plan for the greater Graham area.

In 2002, the County Council adopted Resolution No. 2002-65s, which required the community planning boards and the Planning and Land Services Department to use the adopted Upper Nisqually Valley, Gig Harbor Peninsula, and PSM community plans, and implementing regulations for these plans, as a template for developing future community plans and regulations. Specifically, this Resolution encourages communities to use the existing menu of land use designations and classifications, employ the established use types and levels of use, and recommend changes to administrative processes or development regulations that apply at a countywide scale (e.g., nonconforming use provisions and critical area and stormwater regulations).

PURPOSE AND USE OF THE COMMUNITY PLAN

The Graham Community Plan gives the residents, businesses, property owners, and the County a clear and more detailed sense of how the community should develop in the future and what standards should be utilized to control the character of the community. The purpose of the plan is to:

- Develop a long-range vision for the community;
- Evaluate the vision for the community in light of the Pierce County Comprehensive Plan and make refinements as necessary to ensure consistency between the overall countywide plan and the community plan; and
- Identify actions necessary to implement the community plan, including: adopting or revising land use regulations; identifying priorities for use of public funds to develop physical improvements, such as sidewalks, street landscaping, street lights, water-related improvements, and park development; social programs; economic programs, etc.

COMPONENTS OF THE COMMUNITY PLAN

DEVELOPMENT OF THE VISION STATEMENT

Visioning is a process completed through a series of public meetings or workshops structured to allow the community to articulate hopes for the future. A vision is a statement that provides direction and represents a reflection of who and what the community is and wants to become. Statements, thoughts, and ideas brought forth in the visioning process become the basis for the overall vision statement and provide a context for the individual goals outlined in each plan element.
PLAN ELEMENTS

Each community plan contains elements that address land use, community character and design, economic development, natural environment and facilities and services. These elements contain a description of existing conditions (background information), description of desired conditions, policies and implementing actions.

POLICIES (GOALS, OBJECTIVES, PRINCIPLES AND STANDARDS)

Policies can be categorized into a hierarchy of goals, objectives, principles and standards and collectively serve to implement the vision. Goals describe a desirable future for the community and identify specifics on how the values and hopes set forth in the vision statement will be accomplished. Goals provide the framework for developing the objectives, principles and standards and implementing actions within each element. Objectives are statements which specifically define goal actions. Principles set a particular course of action to accomplish objectives. Standards are specific benchmarks or targets, either quantitative or qualitative, for achieving objectives and principles. When applying the policy statements, each is afforded equal weight and consideration.

IMPLEMENTING ACTIONS

Implementing actions provide the mechanism to accomplish the vision, goals, objectives, principles and standards. Implementing actions are phrased as directives to refine or change policy documents, regulations, capital facility plans, or programs; implement studies or other data collection efforts; or coordinate agencies and community groups to work towards accomplishing other non-regulatory measures.

CONSISTENCY WITH THE PIERCE COUNTY COMPREHENSIVE PLAN

The Growth Management Act requires consistency between plans and implementing development regulations. Furthermore, the Pierce County Comprehensive Plan Community Plans Element contains specific policies that require consistency between the Comprehensive Plan and community plans. The goals, objectives, principles, and standards in the Graham Community Plan are consistent with the provisions in the Pierce County Comprehensive Plan.

PUBLIC INVOLVEMENT

Public involvement is an essential component in the development of an effective community plan. Development of the plan incorporated a variety of public involvement strategies including the formation of a Community Planning Board (CPB), public workshop and open house, and community surveys and assessments. These efforts help ensure that the plan represents the general will and values of the community.
COMMUNITY PLANNING BOARD

The development of the Graham Community Plan could not have been accomplished without the Graham Community Planning Board (CPB). Appointed in the spring of 2002, this board consisted of fifteen members representing a variety of interests and geographic locations throughout the community plan area.

This group was charged with the following responsibilities: 1) serving as a sounding board for the community; 2) developing a community plan and implementing development regulations that address community concerns while remaining consistent with the Comprehensive Plan; and 3) forwarding a recommended plan to the Pierce County Planning Commission and Pierce County Council.

The CPB conducted bi-monthly public meetings starting in March 2002 and continuing through December 2005. A total of 83 CPB meetings were held during this time period and many members of the community attended, enriching the planning process. In addition, a history subcommittee of the CPB conducted 14 separate meetings to work on development of the historic resources section of the plan.

OPEN HOUSES

The CPB worked on developing an overall vision for the community and goal statements for each element throughout the spring and summer of 2002. In September 2002, the CPB held its first open house at Graham Elementary School. This open house was used to provide information to the general public on the community planning process and receive public opinion on the draft vision and goal statements. Many members of the community attended and offered feedback and some suggested changes to the draft documents.

A second open house was held at Kapowsin Elementary School on December 12, 2005 to present the CPB’s final recommendations. This open house gave the public an opportunity to review and comment on the draft plan and proposed implementing regulations prior to its transmittal to the Pierce County Planning Commission and County Council. The CPB used the open house forum to solicit important community feedback regarding their proposed recommendations.

WDOT HIGHWAY 161 ROUTE DESIGN PLANNING (RDP) PROCESS

The Washington State Department of Transportation (WDOT) prepares Route Development Plans (RDPs) for state routes and highways within Washington. These plans typically address issues such as highway mobility needs (tied to existing traffic volumes and forecasts of future demands), highway safety, transit services, nonmotorized transportation needs, access, and environmental constraints.

WDOT commenced an RDP on SR 161 from 234th St. E. south to its intersection with SR 7, in the spring of 2003. The WDOT conducted five stakeholder group meetings for the RDP planning process. Both County staff and community planning board members served on the...
stakeholders group. Three open houses were held (April, June and September 2003) within the community to solicit input on highway needs including improvements to the segment traversing Graham Hill. Approximately 100 residents participated in these open houses. This is the first time that WDOT has developed an RDP at the same time a local community plan is being developed.

**SURVEYS AND ASSESSMENTS**

**GRAHAM COMMUNITY ASSESSMENT - 1999**

The Tacoma-Pierce County Health Department (TPCHD) conducted a community assessment within the Graham area in 1999. The purpose of the assessment is to help communities identify and understand their public health issues and then implement actions which will make the community a healthier place to live and work. This assessment was one of the catalysts to begin a community plan for the greater Graham area and provides valuable insight into community values and issues.

The assessment contains a series of recommendations centered on the following major themes: controlling growth and development, sharing data and information, improving the natural environment, supporting schools and school related activities, reducing crime and increasing safety, and improving County relations. Other miscellaneous recommendations relevant to the community planning process include: developing a community center(s), creating alternative non-sports related activities in the community such as art and theatre, and constructing road improvements to increase safety.

**GRAHAM COMMUNITY PLAN SURVEY - 2002**

In late December 2001/early January 2002 the Pierce County Planning and Land Services Department mailed surveys to 3,337 households throughout the community plan area. An additional 150 surveys were conducted by telephone. A total of 3,487 surveys were distributed by either mail or telephone.

The intent of the survey was to solicit input on a variety of issues including perceived quality of life; adequacy of facilities and services within the plan area; quality of the natural environment; and location and intensity of residential, commercial, and industrial uses. The survey was divided into three categories: existing conditions in the community, policy choices for the community, and household characteristics. Respondents were provided space at the end of the survey to add their own comments.

A total of 257 mailed surveys were completed and returned. This equates to a return rate of 7.7%. When added together with the additional 150 telephone surveys, a total of 407 surveys were completed. Statistically, this represents a sufficient number of surveys returned to obtain an accurate representation of household opinion to within approximately +/-5 percent.
In December 2001 the Washington Department of Ecology (WDOE) published a document titled “Assessment of Surface Water and Groundwater Interchange within the Muck Creek Watershed Pierce County.” This assessment focused on two creek systems located within the plan area including South Creek and Muck Creek. The study was initiated because of intermittent stream conditions negatively affecting salmonids using these systems. The purpose of the assessment was to evaluate the potential cause(s) of intermittent flow conditions within the watershed, provide a general overview of the hydrologic setting which gives rise to problematic conditions, and offer recommendations to help guide area residents and water use managers as they work to enhance or restore instream habitat.

The TPCHD has initiated a watershed plan, under State legislation ESHB 2514, within the Clover/Chambers Creek watershed (WRIA 12). The Nisqually Indian Tribe is the lead for developing the same type of watershed plan for Nisqually River Watershed (WRIA 11), which is also currently underway. These planning efforts will help determine groundwater availability and allocation of groundwater within the watershed. The plans will also analyze water quality and habitat conditions, which are related to water supply issues. Both of these plans provide an assessment of existing environmental conditions within the plan area.

**Summary of the Graham Community Plan**

The Graham Community Plan contains policies and implementing actions for five subject areas or elements: Land Use Element, Community Character and Design Element, Natural Environment Element, Economic Element, and the Facilities and Services Element.

**Land Use Element**

The Land Use Element addresses the location and intensity of land uses throughout the community. A complete description of land use designations and their implementing zone classifications can be found in this element.

**Community Character and Design Element**

The Community Character and Design Element addresses community character, historic and cultural resources, design (commercial, residential, signs, etc.), viewsheds and other aesthetics. This element contains policies that will guide the creation of implementing design standards and guidelines.

**Natural Environment Element**

The Natural Environment Element examines the natural resources found in the area. The policies contained within this element address environmental concerns and guide future development with consideration of on-site environmental constraints and natural hazards.
**Economic Element**

The Economic Element analyzes at the economy of the area and considers a myriad of opportunities to diversify the economic base. The policies within this element provide guidance on ways the community can enhance its economic environment.

**Facilities and Services Element**

The Facilities and Services Element addresses infrastructure and services needed to support the proposed land use growth and development. Infrastructure includes capital facilities such as roads, trails, sewage disposal, parks, and utility lines. The policies within the community plan identify the capital improvements that are necessary to support the plan (sewers, water, sidewalks, etc.) and discuss potential partnerships and sources for funding opportunities.

**Plan Monitoring**

The Plan Monitoring section provides a framework both for monitoring the various actions undertaken to implement the plan and for offering recommendations to make adjustments to the actions in order to better fulfill each of the visions in the plan. This framework provides a means for measuring the effect of each action, identifies participants and their roles in monitoring the actions, lays out time frames for monitoring, and specifies how the monitoring program should be documented. Information from this program will be used in the next plan update cycle to help identify what changes the communities plan may need in order to attain specified goals and meet the visions in the plan.

**Implementation**

The plan also contains proposed actions, located at the end of each element, which serve to implement various plan policies. These actions are grouped into short-term, mid-term and long-term endeavors. Short term actions should occur immediately or within one year of plan adoption. Mid-term actions should be completed within 2-5 years. Long term actions should be completed within 5-10 years of plan adoption. The party or parties responsible for leading the effort to complete the action item is listed in parenthesis following the action. Actions are assigned to a lead entity or entities as the primary responsible party to complete. Examples include the Graham Land Use Advisory Commissions (LUAC), Tacoma-Pierce County Health Department (TPCHD), Public Works & Utilities (PWU), Parks and Recreation (Parks), Economic Development (ED), Pierce County Sheriff, Pierce County Planning and Land Services (PALS) or other county departments or outside agencies and entities as noted.

**Vision Statement**

The greater Graham community, a vibrant, largely rural community, strives to enhance its country image while responding positively to the increasingly diverse needs and expectations of its citizens. It is a community that appreciates its history and maintains the best aspects of rural
living -- safe and peaceful neighborhoods, small town friendliness, affordability, and an abundance of natural beauty highlighted by the splendor of Mount Rainier. It maintains its distinctive natural environment by preserving open space, greenbelts, lakes, streams, wetlands, and agricultural areas. Planned growth is designed to enhance the community's rural atmosphere while protecting natural resources, and incorporates a level of public infrastructure to meet current and future needs. A variety of transportation modes are interconnected within the community, operate efficiently, and provide convenient access to nearby urban areas. Businesses, schools, fire district, law enforcement, and other community services are recognized as an important part of the community's resource base. A compact and attractive town center serves as the focal point for commerce and community activities for all ages. Passive and active parks, trails, and recreational facilities are accessible throughout the community.
Chapter 2: Land Use Element

**INTRODUCTION**

The Land Use Element of the Graham Community Plan provides direction regarding the location of different uses (residential, commercial, industrial, resource lands, etc.) and the density or intensity related to those uses (i.e., how many dwelling units or how big structures can be). This element serves to refine the policies contained in the Pierce County Comprehensive Plan and where the community plan provides more specific guidance or criteria regarding land uses, the provisions of this plan shall govern. In cases where this plan does not provide specific guidance, then the policies in the Pierce County Comprehensive Plan shall be used to determine land use objectives and standards. Finally, the policies contained in this element provide the foundation for changes to the County’s Development Regulations including the zoning maps and codes.

**DESCRIPTION OF CURRENT CONDITIONS**

**EXISTING LAND USES, VESTED PROJECTS, AND NONCONFORMING USES**

**EXISTING LAND USES**

The Pierce County Assessor-Treasurer’s Office (A/T’s office) identifies information for current uses, acreage, and land ownership. The existing land uses within the plan area have been classified by the A/T’s office into various categories such as residential, commercial, industrial, etc. Table F-1 provides specific information regarding existing land uses within the plan area including acreage, percent of plan area, and total parcels in each category. Map F-2 illustrates where these various land use categories are found within the plan area.

</tbody>
</table>

A little more than half the plan area is classified as unbuilt environment, primarily in the natural resource and vacant categories. Of the approximate 12,936 acres categorized as natural resource, 7,835 acres is in forestry use while 5,028 acres is being utilized for agriculture. These two uses represent over a quarter of the plan area (27%), while vacant lands comprise just under a quarter of the plan area (22%). The smaller number of total parcels for the unbuilt environment classification indicates that generally these uses are located on large sized parcels of land. The most prevalent use category within the built environment classification is residential (43%), with the majority designated as single family (28.3%). Residential categories cover over 22,447 acres of land throughout the plan area. Commercial and industrial uses represent only 2% of the total plan area situated on less than 1,000 acres land.
Vested Projects

Washington State law allows for the vesting of land use and building applications. Vesting is a term that means a fully completed application is grandfathered to be reviewed (and a site subsequently developed) under the land use regulations that were in effect at the time that a fully completed application was submitted. In contrast to Washington’s vested rights doctrine, in most other states the regulations that apply to a project are those in effect on the date that the local government grants a permit. Many applications, especially those for longer-term project types such as formal subdivisions (preliminary and final plats) and short plats may be in the “pipeline” for years going through the review and approval process. The County has enacted vesting regulations which require vested applications (pending on July 28, 1996) that have remained in an inactive status be expired (i.e., become null and void) after a one-year time period has elapsed from notification to the property owner. The Hearing Examiner has the authority to grant a single, one-year time period extension to this requirement.

Any fully completed project applications submitted prior to January 1, 1995 were vested under the County’s pre-Growth Management Act (GMA) land use regulations, which established the comprehensive urban growth area (CUGA) and rural lands and associated residential densities. In some cases, pre-GMA vested applications for subdivisions of land contain a higher proposed residential density than is now allowed in the urban zones (e.g., MSF) or rural zones (e.g., Reserve 5 and Rural 10). Table F-2 provides a more detailed description of the pre-GMA vested, pending status formal subdivision applications. Map F-3: Vested Preliminary Plats identifies where the lands for these applications are located throughout the plan area.

| **Total Number of Estimated Lots** | 2,930 |

* Records indicate that the applicant plans on developing commercial uses on five lots and a senior housing facility on remaining lot

The plan area contains approximately 31 active vested applications for formal subdivisions of land, with an estimated 2,930 new lots. Two of the applications, Dayspring and Tanwax Ridge, appear to be expired, which would trip conformance with existing land use regulations should the applicant wish to resubmit a new application for land division. Several of the applications exceed the current allowable density for either MSF or rural residential zones.

**Nonconforming Uses**

A nonconforming use is a use or activity that was lawful prior to the adoption, revision, or amendment of the Comprehensive Plan or development regulation but that fails by reason of such adoption, revision, or amendment to conform to the present requirements of the Comprehensive Plan or development regulation. Title 18A, Pierce County Development Regulations – Zoning contains nonconforming use standards that regulate continued existence and expansion of existing, legal nonconforming uses. These standards allow for expansions in the rural area, through application of a nonconforming use permit, with no maximum cap on the percentage of increase. However, expansions are limited to the parcel on which the use was originally established.
CURRENT COMPREHENSIVE PLAN DESIGNATIONS, ZONING CLASSIFICATIONS, AND OVERLAYS

Land use designations, zone classifications and overlays indicate the type, intensity and density of land uses authorized by the Comprehensive Plan. The 1994 Pierce County Comprehensive Plan, as amended, establishes 10 different land use designations within the plan area. These designations are implemented with 10 zones of the same names. One overlay (Mineral Resource Overlay) is located within the plan area; however, several other areas that function as overlays, such as Shoreline jurisdiction and open space corridors, are also found within the plan area and therefore warrant additional discussion. The Thun Field Airport Overlay, which lies just to the north of the plan boundary, is also included in this discussion because of its impact on and applicability to portions of the plan area. Some of these designations and zones, found inside the County’s comprehensive urban growth area (CUGA) are intended for urban levels of development and uses. Other designations and zones apply to rural and natural resource areas.

The CUGA boundary traverses the northern portion of the plan area generally located at 208th St. E. and jogs at Meridian north to 200th St. E. Rural designations and natural resource designations are located outside identified urban growth areas (UGAs) and the amount of public facilities directed within these areas is very limited, with one key provision being the prohibition on extension of sewer service into these rural areas. It should also be noted that the County’s specified land use designations may not be consistent with the existing uses described in the previous section, which results in a nonconforming use status.

Table F-3 depicts the various comprehensive plan designations, zoning classifications, and overlays, contained in the plan area. Map F-4: Historic Land Use Designations illustrates geographically where these land uses are applied.

The Comprehensive Plan And Development Regulations Contain More Land Use Designations, Zoning Classifications And Overlays Than Those Listed In Table F-3 And Discussions Of These Other Unlisted But Available Land Use Designations, Zones, And Overlays May Be Found In The Pierce County Comprehensive Plan And Zoning Code. Overlays Are Applied Over An Underlying Land Use Designation And Zone And Are Therefore Not Calculated In The Total Land Acreage For The Plan Area.

The Moderate Density Single-Family (MSF); Reserve 5; and Rural 10 and 20 land use designations and zones are intended to primarily accommodate residential uses. The Mixed Use District (MUD), Rural Activity Center (RAC), and Rural Neighborhood Center (RNC) zones provide for a range of commercial and light industrial activities. The Employment Center (EC) zone allows for heavy industrial and warehousing uses. Natural resource uses are facilitated in the Designated Forest Land (FL), Agricultural Resource Lands (ARL), and Mineral Resource Overlay (MRO) designations/zones. The Airport Overlay (AO) addresses compatibility issues between public use airports and adjacent land uses; however, this overlay has not yet been applied in the plan area. The zones vary by the level of density and intensity that is allowed. Each land use designation/zone classification contained within the plan area is described in greater detail below.

**EMPLOYMENT CENTER**

The Employment Center (EC) designation and zone is located within the CUGA and allows for industrial, manufacturing, warehousing, and related office and service jobs. Within these categories a variety of uses may occur including product assembly, fabrication, processing, heavy trucking, wholesale activities, corporate office, and office park development. Some commercial uses that are subordinate to and supportive of employment uses are also permitted. There are 17 acres of designated EC, located along SR 7 just south of 224th St. E., which represents less than .04% of the total plan area.

**MIXED USE DISTRICT**

The Mixed Use District (MUD) designation and zone is located within the CUGA and offers opportunities for auto-oriented commercial and land intensive commercial uses along major arterials, state highways, and major transit routes. Commercial activity within a MUD is
intended to serve a customer base beyond the surrounding neighborhoods or community. The MUD also allows a mixture of high density residential uses. The plan area contains 669 acres of MUD, comprising a little over one percent of the total plan area. There are two places with MUD designation/zoning; one area is located north of 200th St. E. on either side of SR 161 and the other area is situated along SR 7 at the intersection with 224th St. E.

**Moderate Density Single-Family**

The Moderate Density Single-Family (MSF) designation and zone is located within the CUGA and provides areas for urban level single-family and two-family residential development at densities of two to six dwelling units per acre. The “bright-line” for urban level residential development has been established through Puget Sound Growth Hearings Board decisions to be four dwelling units per acre. This designation and zone is located north of 208th and 200th Streets E. and encompasses less than 3% (1,283 acres) of the total plan area.

**Rural Activity Center**

The Rural Activity Center (RAC) designation and zone create areas where residents can gather, work, shop, and entertain, and tourists traveling to outlying recreation areas can obtain needed services. A broad range of commercial, service, and residential uses is envisioned within a RAC. These areas should have immediate access onto state routes or major arterials and should be configured to provide an alternative to the strip development typically found along these types of road systems. There are two RACs within the plan area; one located at SR 161 centered in the vicinity of 224th St. E. (Graham) and the other at the intersection of SR 161 and 304th St. E. (Benston). There are currently 440 acres designated/zoned RAC, representing less than 1% of the total plan area.

The Pierce County Comprehensive Plan outlines specific location, size and expansion criteria for RACs including:

- RACs should be located no closer than five miles from any satellite city UGA or the CUGA boundary.
- RAC boundaries may only be expanded if an evaluation of existing developable lands and unoccupied commercial building square footage demonstrates a need for more land and the expansion area comes no closer than five miles to a UGA or CUGA as described above.
- Proposed expansions of RACs should be compatible with other adjacent uses and should not go into areas of natural hazards.
- New RACs should not exceed 125 acres in size.

**Rural Neighborhood Center**

The Rural Neighborhood Center (RNC) designation and zone provides for limited convenience shopping, services, and residential uses consistent with density allowed in surrounding designation(s), and should have immediate access onto state routes, major arterials, or secondary arterials. There are six RNCs within the plan area situated on 83 acres, which constitutes less than 1% of the total plan area. The RNCs are located in the following areas:
• SR 7 at the intersection with 260th St. E. (Rocky Ridge).
• SR 7 at the intersection with 304th St. E. (Johnson’s Corner).
• SR 7 at the intersection with SR 702/352nd St. E. (Eatonville Cutoff).
• Orting-Kapowsin Highway at the intersection with Kapowsin Highway East (Kapowsin).
• Orting-Kapowsin Highway at the intersection with 224th St. E. (Thrift).
• 208th St. E. at the intersection with 54th Ave. E. (Shady Acres).

The Pierce County Comprehensive Plan outlines specific location, size and expansion criteria for RNCs including:

• RNCs should be located no closer than two miles from any satellite city UGA or the CUGA boundary.
• RNC boundaries may only be expanded if an evaluation of existing developable lands and unoccupied commercial building square footage demonstrates a need for more land and the expansion area comes no closer than two miles to a UGA or CUGA as described above.
• RNCs that provide for development in a continuous strip pattern along road systems is discouraged.
• RNCs should be of a scale and intensity that is appropriate for maintaining a rural character.

**RESERVE 5**

The Reserve 5 (Rsv 5) designation and zone was established to accommodate expansions of the UGA at such a time in the future when the land capacity within the CUGA or satellite city’s UGA has been depleted. The Rsv 5 allows for residential development at a density of one dwelling unit per five acres, with the criteria that proposed lot sizes shall not exceed 12,500 square feet (except that new lots may be increased to 21,780 square feet in the Rsv 5 when residential densities are reduced to one unit per ten acres) and shall be clustered in groups of not more than 12 lots. The plan area contains 3,679 acres of Rsv 5, which represents a little more than 7% of the total plan area. This land use designation and zone is located in the northwest portion of the plan area and generally contains an existing land use pattern of smaller platted lots. The southern edge of the Rsv 5 was established along the boundary between the Chambers Clover Creek Watershed (WRIA 12) and the Nisqually Watershed (WRIA 11).

The Pierce County Comprehensive Plan establishes specific criteria for expansion of the CUGA or a UGA into the Reserve designations including:

• Land capacity within the CUGA or UGA is evaluated and the need for additional land capacity is clearly demonstrated.
• The housing affordability and density objectives of applicable comprehensive plans have been monitored and evaluated.
• Demonstration that adequate public facilities and services can be provided to service urban development and ensure a high quality of life.
• Adequate land use regulations are in place to discourage sprawl and strip development.
Rural 10 and Rural 20

The Rural 10 (R10) and Rural 20 (R20) designations and zones provide for a range of low density residential uses. The intent is to accomplish a rural land use pattern that promotes rural uses, while not requiring urban level services. Cluster development is encouraged within rural residential designations and zones and density bonuses are provided within developments for the dedication of permanent open space. One accessory dwelling unit is also allowed on a residential lot where an existing single-family dwelling exists. The designation and zone number (e.g., 10) represents the base number of acres required per primary dwelling unit (du) as follows:

- R10 allows a density of one du per 10 acres with a density incentive of two dwelling units per 10 acres when 50% of the property is dedicated as open space.
- R20 allows a density of one du per 20 acres with a density incentive of two dwelling units per 20 acres when 50% of the property is dedicated as open space (note: open space dedications shall be located in an area adjacent to Designated Forest Lands zones).

The majority of the plan area (74%) is designated as R10 (36,268 acres). There are 1,438 acres of R20 land (almost 3% of the plan area), which are mostly located in the eastern portion of the plan area near the fringe of designated forest land.

Designated Forest Land

The Designated Forest Land (FL) designation and zone are intended to provide an adequate supply of forest lands for long-term commercial timber harvesting activities. The FL designation and zone allow for timber harvesting, associated forestry activities, and limited residential development at a density of one du per 80 acres. The plan area contains 2,233 acres of FL, which is almost 5% of the total plan area. This designation/zone is located along the eastern edge of the plan boundary.

Agricultural Resource Land

The Agricultural Resource Land (ARL) designation and zone represent lands that have been designated as having long-term commercial agricultural significance. The lands within this category meet the minimum guidelines outlined in WAC 365-190-050 and are comprised of lands that are primarily devoted to the commercial production of horticultural, viticultural, floricultural, dairy, apiary, vegetable, or animal products, or of berries, grain, hay, straw, turf, seed, Christmas trees not subject to the excise tax imposed by RCW 84.33.100 through 84.33.140, finfish in upland hatcheries, or livestock, and that has long-term commercial significance for agricultural production.

Designation of agricultural lands of long-term commercial significance requires consideration of growing capacity, productivity, and soil composition of the land for long-term commercial production and parcel size and proximity to other uses for long-term viability of agricultural use. Urban lands, lands that are already characterized by urban growth and designated forest lands are excluded from this designation. The Comprehensive Plan ARL policies provide specific
criteria for removal of lands from the ARL designation, which includes amendment through adoption of a community plan.

In addition to farming or ranching activities, the ARL designation/zone also allows one du per 10 acres and limited development related to agriculture. Community plans may provide for variations in the density and uses allowed under prescribed guidelines. A community plan may also provide for some civic uses (religious assemblies, small public safety stations such as fire and police) on ARLs following specific criteria.

About 5% of the plan area is designated ARL, situated on 2,838 acres of land. Designated ARLs occur in a scattered pattern but the majority of these lands are generally located in the central and southern portions of the plan area.

**Mineral Resource Overlay**

The Mineral Resource Overlay (MRO) identifies lands that are intended for long-term mineral extraction activities. Typically, lands designated as MRO have an existing surface mining operation that has been permitted through the Washington State Department of Natural Resources (WDNR) and a County issued conditional use permit or historic unclassified use permit, which dictates time limitations, performance standards during mining activities, and reclamation actions.

There are 365 acres of designated MRO land within the plan area, representing less than 1% of the total land area. These lands are located in the extreme northeast corner of the plan area and at the southeast corner of 224th St. E. and Mountain Highway (Elk Plain Road Shop). All of the land within the plan area designated as MRO is currently owned by Pierce County – Public Works and Utilities Department.

**Airport Overlays**

The Growth Management Act (RCW 36.70A) recognizes the inherent social and economic values of aviation. The law specifically lists public use airports as essential public facilities (RCW 36.70A.200) and requires counties and cities to protect general aviation airports from incompatible development (RCW 36.70A.510 & 547) with implementation through comprehensive plan policies and development regulations.

The Pierce County Comprehensive Plan and Zoning Regulations contain policies and land use regulations regarding lands that are located around airports. The intent of these policies/regulations is to minimize land use incompatibilities and reduce risks to life safety through establishment of performance standards, maximum building coverages, limitations on the number of persons on site at any one time, or requirements to construct buildings with noise attenuation features.

The Zoning Code establishes an Airport Overlay Zone that provides specific standards for the Pierce County (Thun Field) Airport area of influence. The recently adopted South Hill Community Plan identifies the area of influence for the Pierce County Airport. Part of this area of influence (4-outer safety zone and 6-traffic pattern zone) covers the northern portion of the plan area (see Map F-6: Pierce County Airport - Thun Field Area of Influence). Maximum height
limits within this area of influence are prescribed through Federal Aviation Administration standards, which are illustrated in Map F-7: Pierce County Airport - Thun Field Object Height. However, the current Zoning Code regulations only apply within the South Hill Community Plan area and do not apply to the affected area within the Graham Community Plan boundaries.

The Zoning Code also contains a Rural Airport Overlay (RAO) that includes standards for airports in designated rural lands. This overlay provides use and density restrictions intended to protect the airport from neighboring land uses that are incompatible with aviation activities and buffer requirements designed to minimize impacts between the different uses.

The plan area does not currently have any RAO despite the fact that there are several small, residential airfields located within the plan area. According to the Washington State Department of Transportation, Shady Acres Airport is considered a Public Use Airport and as such should receive consideration for an Airport Overlay.

**SHORELINE JURISDICTION**

The Shoreline Management Act (RCW 90.58) provides for the management of water bodies or watercourses identified as Shorelines of the State. Areas under jurisdiction of the SMA include the water body/course, all lands within 200 feet of the ordinary high water mark, and associated wetlands and floodplains.

The Pierce County Shoreline Master Program and Shoreline Management Use Regulations identify policies and land use regulations for designated shorelines. The Shoreline Management Use Regulations establishes a shoreline jurisdiction; provides five different shoreline environment categories; outlines allowable uses, densities, bulk standards such as setback requirements within these environments; and identifies permit processes for each type of proposed use. The five types of shorelines environments include Urban, Rural Residential, Rural, Conservancy, and Natural. These environments are similar to zoning designations in that they allow different land uses, densities and activities ranging from the most intensive uses (Urban) to very limited uses (Natural).

The plan area contains four of the five designated shoreline environments including: Rural Residential, Rural, Conservancy, and Natural. Designated shorelines within the plan area are described and mapped in greater detail in the Natural Environment Element, Description of Existing Conditions.

**CRITICAL AREA**

The Growth Management Act (RCW 36.70A) requires local jurisdictions to adopt regulations addressing critical areas. Critical areas are defined under five categories including: wetlands, frequently flooded areas, geologically hazardous areas (landslide, erosion, seismic, mine, and volcanic), aquifer recharge areas, and fish and wildlife habitat conservation areas. The County’s Critical Area Regulations, as amended, act as an overlay by providing standards for development in and adjacent to critical areas that may affect the location, density and intensity, layout and design of proposed development as envisioned in the various land use designations and zones.
Title 18A, Development Regulations-Zoning sets forth criteria for calculating the allowable number of dwelling units. Within urban zone classifications the allowable number of dwelling units (i.e., allowable density) is calculated by multiplying the net developable acreage of the site by the allowed density in dwelling units/acre. Net developable acreage is determined by removing the total amount of land designated as environmentally constrained from the total parcel size. Environmentally constrained land is defined as erosion hazard areas, landslide hazard areas, and wetlands (as set forth in the Critical Area Regulations) and all land below the ordinary high water mark of lakes, streams, ponds, and tidal waters. This provision does not apply to rural zone classifications, in which density is calculated based on gross site acreage.

There are a variety of critical areas scattered throughout the plan area. Critical areas within the plan area are described and mapped in greater detail in the Natural Environment Element, Description of Existing Conditions.

**Open Space Corridor**

The Growth Management Act (RCW 36.70A) contains a goal to encourage the retention of open space [36.70A.020(9)]. The GMA also requires local jurisdictions to provide for open space corridors and greenbelts within and between urban growth areas and explicitly states that these open space corridors include lands useful for recreation, wildlife habitat, trails, and connection of critical areas.

The Pierce County Comprehensive Plan contains policies that address open space. Map F-8: Open Space Corridors identifies the designated open space corridors throughout Pierce County, which is based upon high priority open space categories (fish and wildlife habitat, wetlands, rivers, streams, creeks, marine waters, and wooded areas). These designated open space areas serve as an overlay in which more detailed land use regulations can be applied to accomplish the preservation of open space corridors. For example, special requirements and standards contained within Title 18A, Zoning and Title 18J, Design Standards and Guidelines can be utilized within open space corridor overlay areas. In addition, several County programs address open space preservation, including the Conservation Futures Program (fair market value acquisition of properties and conservation easements for open space purposes) and the Current Use Assessment Program-Open Space (tax reductions given to retain property in an open space condition).

The plan area contains 28,289 acres of land identified within the open space corridor overlay. These areas are described and mapped in greater detail in the Natural Environment Element, Description of Existing Conditions.

**Solid Waste Facilities**

The Graham Community Plan area contains the County’s main solid waste landfill facility, which is located at 304th Street East and east of SR 161. This landfill was authorized pursuant to Conditional Use Permit CP8-89/AE9-95/AE10-95. Solid waste handling facilities are listed in the Growth Management Act as essential public facilities [RCW, 36.70A.200 (1)]. This section of the Act requires each County and City planning under GMA to include a process for identifying and siting essential public facilities. In addition, the Pierce County Comprehensive Plan and Solid
Waste Plan identify this landfill as a public facility. However, this facility is currently not labeled with an essential public facility overlay. Consideration should be given to application of an essential public facility – solid waste facility to this landfill facility. This would be consistent with what has been done for other essential public facilities such as creating an airport overlay for Thun Field Airport and Tacoma Narrows Airport or a state corrections overlay for McNeil Island State Corrections Center.

**Vacant, Redevelopable, and Underdeveloped Lands and Vacancy Rates**

As described above, many of the Pierce County Comprehensive Plan policies require an analysis of existing developable lands and unoccupied commercial building square footage that demonstrates a need for additional lands prior to proposing expansions of various land use designations and zones. The amount of vacant, redevelopable, and underdeveloped lands provides part of this analysis. Evaluating the amount of available commercial space and the limitations on future development also affects such decisions.

**Vacant Lands**

Vacant lands include unimproved parcels and also properties that have had structures removed or where uses, such as farming, have been abandoned. The vacant category does not include lands that are being used for agricultural or forestry purposes or that may be large parcels with a single-family dwelling, as these lands would be classified as agricultural, designated forest land, or single family.

Table F-4 provides an analysis of the amount of vacant acreage throughout the plan area and the percentage this represents. Map F-9: Vacant Land illustrates where these parcels are located.

</table>

\(^{(1)}\) This is the total acreage of the RAC or RNC which may include land area outside the Graham Community Plan boundaries.

Vacant lands account for 10,813 acres of land within the plan area, representing almost one-quarter of the total plan area. The majority of vacant lands are located within the R10 designation/zone. However, some of this land area may be currently utilized for unaccounted agricultural or forestry activities. There are 360 acres of vacant land in the commercial and industrial centers located within the plan area. The total amount of vacant land within commercial and industrial designations signifies that there is currently room for additional new development; however, a more detailed analysis is warranted to determine if expansion should be proposed for any of the individual centers. Most of the centers have large vacant land areas. Several areas (Elk Plain EC, Johnson’s Corner RNC, and Thrift RNC) have no vacant lands and the Mixed Use District in Elk Plain has a small level (1.01%) of vacant acreage. This situation may indicate a need to increase the size of these centers to accommodate future growth but this should be evaluated in conjunction with whether the total amount of redevelopable lands is also low and consistency with the GMA provisions for Limited Areas of More Intensive Rural Development (LAMIRD) criteria.

**REDEVELOPABLE AND UNDERDEVELOPED LANDS**

Redevelopable commercial and industrial parcels are zoned for commercial or industrial uses with a land value greater than or equal to the improved value. Underdeveloped residential parcels are either zoned for residential uses where the existing land use is residential, with an
area greater than or equal to 43,560 square feet, or zoned for commercial that allows residential uses where the existing land use is residential with an area greater than or equal to one-quarter acre. Underdeveloped only applies to urban land use designations.

Table F-6 provides an overview of redevelopable and underdeveloped lands. Map F-10: Underdeveloped and Redevelopable Land illustrates where these parcels are located in the plan area.

</tbody>
</table>

There are a total of 480 acres of properties identified as redevelopable within the commercial and industrial centers. Within the MUD designation/zone, there are 324 acres identified as redevelopable for commercial uses and 149 acres within the RACs. The MSF designation and zone has 502 underdeveloped parcels for residential uses. This reflects the fact that single-family dwelling units are situated on larger, more rural sized parcels. Only 12.79 acres within the MUD designation/zone are identified as underdeveloped which indicates that there is currently single-family or some other types of residential uses mixed in with the commercial uses.

Table F-7 identifies the amount of total acreage and redevelopable acreage within each individual commercial and industrial center. This table also depicts the total percentage the quantity of redevelopable land represents.

</tbody>
</table>

Nearly half (45%) of the properties within the Meridian MUD and over half (63%) of the properties in the Elk Plain MUD are considered redevelopable. The Graham RAC has 109 acres that are redevelopable, which represents approximately one-third (29%) of the total properties. The Shady Acres RNC indicates zero redevelopable properties but the entire six acres are also listed as vacant (see Table F-4). The Thrift RNC has no redevelopable parcels; however several of the properties within the RNC contain single-family/mobile homes that could possibly convert to or redevelop as commercial uses. The Kapowsin RNC has a small percentage (9%) of redevelopable parcels.

### Vacancy Rates

A windshield survey of tenant space vacancy within the plan areas’ MUDs and RACs was conducted in September 2003. This information was used during discussions regarding the size of commercial centers within the plan area. At that time very little vacant (leasable) space was available. The survey found two spaces in Graham Square, three spaces in Graham Town Center, one space in Bethel Station (in the Time Oil building), and one space north of the barber shop. About 15,200 sq. ft. of vacant commercial space was identified, out of the 425,575 sq. ft. estimated to exist in the Graham MUD and RAC zones, which reflects a vacancy rate of about 3.57%.
RURAL DEVELOPMENT CRITERIA AND LIMITED AREAS OF MORE INTENSIVE RURAL DEVELOPMENT (LAMIRD) EVALUATION

GROWTH MANAGEMENT ACT REQUIREMENTS FOR RURAL DEVELOPMENT

The Growth Management Act (GMA) was enacted to prevent the inappropriate conversion of undeveloped land into sprawling, low-density development and development that conflicts with agricultural and forestry activities. Contained within the GMA are specific criteria for what constitutes rural development. Acceptable rural uses include rural residential development, forestry and agriculture. Rural areas may also provide for a variety of rural densities, uses, essential public facilities, and rural governmental services needed to serve the permitted densities and uses.

In 1997, the GMA was amended to include new criteria for limited areas of more intensive rural development (LAMIRD). The LAMIRD criteria allows for limited areas of more intensive rural development, including necessary public facilities and public services to serve a limited area. Limited areas are defined as infill, development or redevelopment of existing commercial, industrial, residential, or mixed-use areas, whether characterized as shoreline development, villages, hamlets, rural activity centers, or crossroads developments. Development or redevelopment (in terms of building size, scale, use or intensity) within these areas shall be consistent with the character of the existing areas. Development and redevelopment may include changes in use from vacant land or a previously existing use so long as the new use conforms to an existing area or existing use that was in existence on or before July 1, 1990.

More intensive rural development may also include small-scale recreational or tourist uses, including commercial facilities to serve those recreational or tourist uses, which rely on a rural location and setting, but that do not include new residential development. A small-scale recreation or tourist use is not required to be principally designed to serve the existing and projected rural population. Public services and public facilities shall be limited to those necessary to serve the recreation or tourist use and shall be provided in a manner that does not permit low-density sprawl.

The LAMIRD criteria also allows for the intensification of development on lots containing isolated nonresidential uses or new development of isolated cottage industries and isolated small-scale businesses that are not principally designed to serve the existing and projected rural population and nonresidential uses, but do provide job opportunities for rural residents. Rural counties may allow the expansion of small-scale businesses as long as those small-scale businesses conform to the rural character. Public services and public facilities shall be limited to those necessary to serve the isolated nonresidential use and shall be provided in a manner that does not permit low-density sprawl.

Each county is tasked with the responsibility to adopt measures to minimize and contain the existing areas or uses of more intensive rural development, as appropriate. Lands included in such existing areas or uses shall not extend beyond the logical outer boundary of the existing area or use, thereby allowing a new pattern of low-density sprawl. Existing areas are those that are clearly identifiable and contained and where there is a logical boundary delineated...
predominately by the built environment, but that may also include undeveloped lands if limited. In establishing the logical outer boundary the following shall be addressed: the need to preserve the character of existing natural neighborhoods and communities; physical boundaries such as bodies of water, streets and highways, and land forms and contours; the prevention of abnormally irregular boundaries; and the ability to provide public facilities and public services in a manner that does not permit low-density sprawl.

**Pierce County Comprehensive Plan Policy Regarding LAMIRD**

In 2004, Pierce County initiated a review to complete the 10-year update of the Comprehensive Plan as required by the GMA. The update process included reviewing any new provisions that were incorporated into the GMA since the County adopted its Comprehensive Plan in 1994. One of the issues raised was the new LAMIRD criteria and the need to conduct an evaluation of all the Rural Centers (Rural Activity Centers and Rural Neighborhood Centers) in the County. The County Council made the policy choice to conduct this evaluation at the community plan scale. A new policy was incorporated into the Pierce County Comprehensive Plan that states upon the initiation or update of a community plan in the rural area of the County, all rural centers shall be evaluated and updated as necessary to be consistent with GMA provisions in RCW 36.70A.070(5) for LAMIRDS. This policy became effective on February 1, 2005 and applies to the Graham Community Plan process.

**LAMIRD Evaluation of the Rural Centers**

Review of the Rural Activity Centers and Rural Neighborhood Centers logical outer boundaries and uses consisted of a determination of what uses were in existence within the current Rural Center boundaries on or before July 1, 1990; what commercial or industrial uses were developed between July 1, 1990 and the present; what parcels contain vested applications for a commercial or industrial use; vacant lands; and other low density residential (mobile homes, single family) or agricultural uses. While the GMA establishes a July 1, 1990 date for determining logical outer boundaries and uses it is also important to consider uses that were developed in legal conformance with the applicable regulations during the time period that spans between 1990 and today. These uses either relied upon the previous non-GMA zoning or on the RAC and RNC zoning to develop. Applications for conforming uses have a vested right to develop under the regulations that were in place at the time of application.

The following text, tables, and Map F-11 through Map F-18 illustrate the LAMIRD evaluation for each rural center. A series of maps for each rural center visually depict the uses in place on or before July 1, 1990, uses developed between 1990 and today, vacant lands, vested applications and other types of uses (i.e., single-family, single-wide or double-wide mobile homes, etc.). The Rural Activity Centers and Rural Neighborhood Centers contain a range of uses that are more intensive than single-family residential, such as commercial, industrial and civic uses. These uses include mixed retail, business offices, grocery stores, sales of general merchandise, personal services, banks, churches, schools, auto repair and service facilities, fire stations, warehouses, medical and veterinary offices, restaurants and taverns, granges, and manufacturing. Table F-8 provides a more detailed description of uses and vested applications for each rural center.

</tbody>
</table>

**GRAHAM RAC (SR 161 AND 224TH ST. E.)**

The uses in existence before July 1, 1990 form a logical outer boundary of the rural commercial center located at the intersection of SR 161 and 224th St. E. In addition, 232nd Street East, 234th Street East and a railroad right-of-way provide a logical outer boundary at the southern boundary. There is a range of commercial and light industrial uses that were in existence on or before July 1, 1990 and that were developed between 1990 and today. In addition, there are several vested applications for commercial uses within this RAC.

**BENSTON RAC (SR 161 AND 304TH ST. E.)**

Within the Benston RAC there is a gas station/mini-mart located at the northeast corner of the intersection which was established before July 1, 1990. The parcel at the northwest corner of that intersection contains a hay and portable building sales operation. The two parcels at the southwest corner are developed with a vacant house and pole building that have historically accommodated several commercial uses including a restaurant, beauty salon, and sign business. The other parcels within the RAC are vacant and, as of the writing of this plan, there are no vested applications for development proposals on any of these properties.

**SHADY ACRES RNC (208TH ST. E. AND 54TH AVE. E.)**

The Shady Acres RNC is currently comprised of one vacant parcel and, as of the writing of this plan, there is no vested application for a development proposal.

**ROCKY RIDGE RNC (SR 7 AND 260TH ST. E.)**

Within the Rocky Ridge RNC there are existing commercial/industrial uses (realty office, mini-warehouse, manufacturing and mini-mart/gas station) between 260th St. E. and 267th St. E. The current RNC boundaries south of 260th St. E. form a logical outer boundary. The properties to the north of 260th St. E. are currently vacant and fall outside the logical outer boundary and, as of the writing of this plan, there are no vested applications for development proposals on either of these properties.
Johnsons Corner RNC (SR 7 and 304th St. E.)

The portion of the Johnson’s Corner RNC that falls within the plan area is developed with intensive uses (mini-mart, warehouse, and tavern) that were in existence before July 1, 1990.

Eatonville Cutoff RNC (SR 7 and SR 702/352nd St. E.)

The parcels within the Eatonville Cutoff RNC that are located within the plan area are currently vacant and, as of the writing of this plan, there are no vested applications for development proposals.

Kapowsin RNC (Orting-Kapowsin Hwy and Kapowsin Hwy E.)

The Kapowsin RNC is an example of the classic rural node containing a small grocery store, fire station, grange, post office, and tavern. These uses are tightly clustered at the intersection of Orting-Kapowsin Highway and Kapowsin Highway. All these structures were in existence on or before July 1, 1990 with several dating back to the earlier part of the century. Two parcels contained within the RNC are developed with single-family residences. These parcels are either between existing commercial uses or serve to form a regular boundary.

Thrift RNC (Orting-Kapowsin Hwy and 224th St. E.)

The properties within the Thrift RNC that are located to the north and south of 224th St. E. on the west side of Orting-Kapowsin Highway are developed with more intensive uses (general store, church, mobile home park and warehouse) that were in existence before July 1, 1990. These uses form a logical boundary. The three properties to the east of Orting-Kapowsin Highway are either vacant or single family and property owners and others have verified that these parcels have been used for contractor yard type uses.

Description of Desired Conditions

One of the most significant issues addressed within the community plan process is land use. How land is utilized within a community directly affects the community’s character and quality of life perceived by its residents. Generally speaking, the land uses within the plan area should reflect a rural character and provide a stepped-down scale from the intensity and density of uses found in the more urban neighboring community plan areas of South Hill, Frederickson, and Parkland-Spanaway-Midland. As such, the community has chosen to lower the maximum urban residential densities and commercial intensities. In addition, rural residential densities have also been amended to reflect a larger lot pattern or provide increased protections for or from critical areas. Finally, agriculture is very important to citizens within the plan area and the area designated as farm land has been significantly increased to more accurately reflect current farming and agricultural activities. The following section describes in greater detail the proposed land use designations and zoning classifications as recommended in this plan.
Two new land use designations (Rural Sensitive Resource and Rural Farm) will be applied within the Graham Community Plan area. Five new zoning classifications (Community Employment, Single Family, Moderate High Density Residential, Rural Sensitive Resource, and Rural Farm) and one zoning overlay (Thun Field Airport Overlay) will also be applied to the Graham Community Plan area. Although the community plan proposes to change two land use designations within the area, one of the proposed designations (Rural Sensitive Resource) is already defined and policy direction is included in the County Comprehensive Plan. The Rural Farm designation establishes new policy language in the Comprehensive Plan. The proposed zoning changes outlined in the community plan also create one new zone classification (Rural Farm) within the Pierce County Zoning Code, and otherwise utilize existing zone classifications applied either Countywide or in other community plans. The following text, tables, and maps illustrate the proposed changes in land use designations, zone classifications, and overlays contained within the community plan and correlating acreage changes for each. (See Map F-1: Land Use Designations, and Map F-19: Proposed Open Space Corridors)

<sup>(1)</sup> Portion of acreage change is the result of parcel data shifting to centerline of the road.
<sup>(2)</sup> Commercial and/or industrial center deleted.
Urban Designations and Zones

Employment Center Designation

The Employment Center (EC) designation provides land for industrial and heavy commercial uses including manufacturing, trucking and warehousing, and auto services. Under the 1994 Pierce County Comprehensive Plan, 17 acres of land within the plan area are designated EC. The community plan proposal would retain the same area as an EC land use designation and rezone this area to Community Employment.

Proposed Zoning – Community Employment

The CE zone would be applied to the same 17 acres of current EC zone along Mountain Highway just south of the intersection with 224th St. E. This new zone scales back the range of allowed industrial and commercial uses to low to moderate intensity, which better reflects a rural character. Examples of allowed industrial uses include forest based industries, contractor yards, food processing and packaging, breweries and wineries, salvage yards and vehicle storage, and industrial services and repair facilities. Commercial uses that are allowed include administrative and professional offices, educational services, indoor and outdoor amusement and recreation, building materials and garden supplies, bulk fuel dealers, business services, eating and drinking establishments, small scale food stores, motor vehicle related sales and services, personal services, pet sales and services, rental and repair services, small scale sales of general merchandise, storage and wholesale trade. Some of the uses are only allowed through the application of a conditional use permit, which will give surrounding property owners the opportunity for review of proposed uses through a public hearing process. Residential uses and lodging will be prohibited in the CE.

Mixed Use District Designation

The primary role of the Mixed Use District (MUD) is to serve auto-oriented commercial activities and a range of moderate to high intensity uses. MUDs are areas with a diversity of commercial retail, service, and office uses and are typically characterized by individual businesses on separate lots with separate access and parking lots. Commercial activity in MUDs caters to a customer base beyond the surrounding neighborhoods or community due to its placement on a roadway used by residents of more than one community. MUDs also offer the opportunity for higher density residential developments. The land area designated MUD remains the same as under the current plan (669 acres).

Proposed Zoning – Mixed Use District and Moderate High Density Residential

The MUD designation will be implemented by two zones: Mixed Use District (MUD) and Moderate High Density Residential (MHR). The MUD zone will continue to offer a variety of auto-oriented, moderate to high intensity uses including commercial, service, light industrial, office, civic, and residential. The MHR zone allows for a variety of higher density residential use types including multifamily, single-family attached, mobile home parks, and senior housing and
also some compatible civic uses. Densities within MHR range between a minimum of four dwelling units per acre up to a maximum of 15 dwelling units per acre.

The MUD zone along Mountain Highway at 224th St. E. will be retained within the current boundaries. The existing MUD zone along SR 161 north of 200th St. E. will be separated into MUD and MHR zones. The MHR zone is applied where land is already developed with a higher intensity residential use or is surrounded by residential uses and does not have direct access to SR 161. The new MHR zone is 484 acres. The remaining vacant properties that have access to SR 161 will be retained in MUD zoning. The MUD zone has been reduced to 184 acres.

**Moderate Density Single-Family Designation**

The Moderate Density Single Family (MSF) designation allows for single-family or two-family dwellings. Commercial and industrial uses are prohibited and some limited civic uses are allowed. Specific densities are based on physical constraints and the availability of urban services such as sewers. The designation generally allows two to six dwelling units per acre. The land area to which this designation applies will stay the same as established through the current plan (1,283 acres).

**Proposed Zoning – Single Family**

The MSF designation will be implemented by a new Single Family (SF) zone. This zone is intended to provide a transition zone from the higher densities allowed in South Hill to the rural portion of the plan area. The SF still allows for single-family dwellings but at a maximum density of four dwelling units per acre. Some compatible civic uses are also permitted. There are 1,283 acres proposed to be zoned SF.

**Rural Designations and Zones**

**Rural Activity Center Designation and Zone**

The Rural Activity Center (RAC) designation provides for a range of commercial, office, service, and civic uses necessary to serve a rural population. The intensity of development should be smaller scale (i.e., buildings with less square footage) than commercial development allowed within the urban portions of the plan area. The plan proposes to retain the Benston RAC located at SR 161 and 304th St. E. and the Graham RAC at SR 161 and 224th St. E. with some slight modifications, described in greater detail below. The RAC zone implements the RAC designation. The RAC designation and zone is decreased by 234 acres to 206 acres.

**Rural Neighborhood Center Designation and Zone**

The Rural Neighborhood Center (RNC) designation recognizes several historic commercial and civic centers in the rural area, typically located at cross-roads of main thoroughfares or old town centers. The uses within a RNC should be constrained in intensity and size and limited to only those uses that provide necessary services to rural residents and tourists. The RNC zone
implements the RNC designation. The RNC designation and zone is now 53 acres with a reduction of 30 acres from the current plan.

**PROPOSED CHANGES TO THE RURAL ACTIVITY CENTERS AND RURAL NEIGHBORHOOD CENTERS**

The rural centers were evaluated using the criteria in the Growth Management Act for limited areas of more intensive rural development (LAMIRDs). This criterion was also balanced with the desire to recognize the current development pattern and historic commercial activities. The following text provides a synopsis of the decisions for each rural center.

**Graham RAC:** The Graham RAC located at 224th St. E. and SR 161 includes many commercial businesses that have been in existence since before July 1, 1990. In the years between 1990 and today the Graham Town Center shopping complex was developed, which includes a range of retail and service uses. The boundaries in the Graham RAC have been adjusted to limit the area of rural commercial zoning based on LAMIRD criteria. The Commercial uses in existence in July of 1990 were identified and establish the logical outer boundary of RAC. As a result, many commercial uses that were legally developed are proposed to be redesignated to R10 and will become nonconforming.

**Benston RAC:** The Benston RAC located at 304th St. E. and SR 161 contains several existing businesses. This RAC should be retained to recognize both existing and historic businesses and provide a location for rural services, given this node’s distance from any other rural center.

**Shady Acres RNC:** The Shady Acres RNC located at 208th St. E. and 54th Ave. E. should be removed from RNC classification as the land is currently vacant and other rural centers or urban commercial areas are located in close enough proximity to serve the needs of rural residents in this area.

**Rocky Ridge RNC:** The boundaries of the Rocky Ridge RNC at SR 7 and south of 260th St. E. should be retained to recognize the historic businesses and those that developed during the last 15 years. In addition, the two vacant parcels just north of 268th St. E. should be retained to connect to the existing commercial development across Mountain Highway (located outside the plan area) in order to form a regular boundary. Removal of these parcels would truncate the RNC. However, the two vacant parcels to the north of 260th St. E. fall outside the logical outer boundary and should be redesignated to R10.

**Johnson’s Corner RNC:** The Johnson’s Corner RNC on the southeast corner of SR 7 and 304th St. E. contains a mini-mart/gas station and tavern and should be retained as RNC to recognize these existing businesses.

**Eatonville Cutoff RNC:** The Eatonville Cutoff RNC at SR 7 and SR 702/352nd St. E. should be removed from the RNC classification and redesignated to R10 as the land is currently vacant.

**Kapowsin RNC:** The Kapowsin RNC clustered at Orting-Kapowsin Highway and Kapowsin Highway E. should be maintained. This RNC contains a mix of rural uses including a tavern, grocery store, fire station, grange, and post office. The other two parcels located within this RNC contain single-family residences but inclusion of these properties in the RNC is necessary to create a logical outer boundary based on infill and the desire to create a regular form.
Thrift RNC: The Thrift RNC located at Orting-Kapowsin Highway and 224th St. E. should be retained.

Rural 10 Designation and Zone

The Rural 10 (R10) designation primarily accommodates low-density single-family residential, agricultural, forestry, and recreational uses. Some types of civic uses and recreational uses, such as parks and trails, are also permitted in this designation. The residential density within the R10 is one dwelling unit per 10 acres with a bonus density of two dwelling units per 10 acres when 50% of the property is set aside as open space. Existing parcels that are less than 10 acres and are zoned R10 can be built upon as long as the other criteria such as septic, water, critical areas, and other County requirements are met. The R10 zone implements this plan designation.

The R10 designation and zone has been modified within the plan area to include some of the Rural 20 (R20) properties and exclude lands now designated and zoned RSR, R20, and RF (explained in greater detail below). The R10 decreased by 23,882 acres to 12,385 acres.

Rural 20 Designation and Zone

The Rural 20 (R20) designation is utilized within the volcanic hazard areas of the plan area. This designation provides for very low-density single-family residential, agricultural, and forestry uses and other uses that may accommodate congregations of people or people with special needs have been restricted. Most of the areas that are located within the volcanic hazard area currently fall within designated R20. Areas designated R10 within the volcanic hazard area are redesignated to R20 and areas outside the volcanic hazard area designated R20 are redesignated to R10. The R20 designation increased by 253 acres to 1,186 acres. The R20 zone implements this plan designation.

Rural Sensitive Resource Designation and Zone

The Rural Sensitive Resource (RSR) designation includes those properties designated as open space on the Pierce County Open Space Corridor map and is located within 500 feet of sensitive water bodies such as wetlands, Muck Creek, South Creek, Kapowsin Creek, etc. This designation is intended to protect surface waters, aquifers, and fish and wildlife habitat from degradation by more intensive rural residential development and some types of civic uses that may be also be permitted in other rural classifications. New development within the RSR shall utilize low impact development techniques and the properties located within this designation are considered a high priority for community open space preservation and acquisition efforts. Residential densities within this designation are limited to a base density of one dwelling unit per 10 acres. Organizational camps are appropriate in areas designated RSR. There are 22,514 acres within the plan area that have been redesignated to RSR. The RSR zoning classification implements this plan designation.
The Rural Farm (RF) designation includes properties that are five acres or more in size, which are currently being used for or have historically been used for farming activities or have been previously zoned agriculture and that are not currently designated as Agricultural Resource Land (ARL). This new RF designation is intended to recognize properties that provide agriculture within the community but may or may not meet the soils criteria for designation as ARL. It should be noted, however, that parcels meeting the criteria for Rural Farm that fall within the volcanic hazard area will be designated R20. A variety of agricultural related uses are allowed within the RF designation as well as the protections and incentives afforded to ARL. Densities within this designation are limited to one dwelling unit per 10 acres. There are 4,206 acres within the plan area that have been redesignated to RF. The RF zoning classification implements this plan designation.

The Designated Forest Land (FL) designation is intended to conserve and reflect areas of long-term commercial forestry. Uses that are allowed within this designation include timber harvesting and related forest resource based industries. Some civic uses, such as fire and police stations, are also allowed in this designation. The FL area is located in the eastern portion of the plan area. The land area to which this designation applies will stay the same as established through the current plan (2,233 acres). The Forest Land zone implements this plan designation.

The Agricultural Resource Land (ARL) designation is intended to preserve parcels that contain prime agricultural soils for long-term agricultural activities. These properties are identified through a Countywide process. This designation allows for a variety of agricultural uses. One parcel of land that is currently being utilized for a landfill operation will be removed from the ARL designation. The ARL zone implements this plan designation.

The Thun Field Airport Overlay will be extended into the plan area based on the Thun Field - Area of Influence map. The same regulations that were adopted through the South Hill Community Plan shall be applied to the Thun Field Airport Overlay area within the Graham Community Plan. There are 250 acres within the plan area to which this airport overlay will be applied.

Pierce County has not yet conducted an evaluation of all the potential mineral resource lands within the County. Until such time as this study has been completed, no new mineral resource
overlay areas should be established within the plan area. Surface mining operations should be restricted to sites that already have issued Washington State Department of Natural Resources surface mining permits and County approval for such operations. New surface mining operations are prohibited until the Countywide evaluation of potential mineral resource lands has been conducted. The land area to which this overlay applies will stay the same as is currently established through the Pierce County Comprehensive Plan and/or zoning regulations.

**Essential Public Facility – Solid Waste Facility Overlay**

An Essential Public Facility – Solid Waste Facility Overlay will be applied to the LRI landfill site located at 304th Street East and east of SR 161 as authorized through Conditional Use Permit CP8-89/AE9-95/AE10-95. The regulations should accommodate existing and authorized landfill operations. This overlay encompasses approximately 325 acres.

**Open Space Corridor**

The Open Space Corridor Map should be amended to include additional identified areas of wetlands, oak woodlands and prairies, and wildlife habitat and movement corridors. The Open Space Corridor Overlay area has increased by 5,423 acres to 25,182 acres. Environmentally sensitive design techniques should be applied within open space corridors including the use of low impact development techniques as outlined in the Pierce County Site Development and Stormwater Management Manual. Dedication of permanent open space should be required through the site development or land division process and the amount of open space dedication should be based on the proposed density or intensity of use.

** Dwelling Unit Capacity**

Under the Growth Management Act, Pierce County is required to plan for a density of at least four dwelling units per net acre within its urban growth areas. In order to accommodate future population growth within the urban area, the community plan seeks to ensure that the overall housing capacity within the plan area is not diminished as a result of the proposed zone changes. A comparison of the existing and future urban dwelling unit capacity by zone is set forth in Table F-13.

**Table F-13: Comparison of Existing and Future Urban Dwelling Unit Capacity by Zone**

<table>

<td>0</td>
<td>778</td>
<td>+778</td>
</tr>
</tbody>
</table>
As noted above, the community plan increases overall dwelling unit capacity in the community by 365 dwelling units. The increase in the dwelling unit capacity accommodates approximately 1,135 more people. The majority of this population (67%) would be accommodated in the SF zone with single-family homes at four dwelling units per acre. The remaining population would be accommodated at higher allowable densities within the MUD and MHR zones. It should be noted that the buildable lands analysis performed on the 2000 parcel inventory assumed existing golf courses were built-out, and thus did not consider this land acreage for additional capacity. Since that time, an application has been submitted to change the Lipoma Firs Golf Course into a Planned Development District (PDD) that proposes 1,073 single-family dwelling units and 624 multifamily dwelling units for a total of 1,697 additional dwelling units. Applying the 3.11 persons per dwelling unit this development would accommodate an additional 5,278 people for housing capacity within the plan area’s UGA.

**Community Centers**

Community centers (Mixed Use Districts, Rural Activity Center, and Rural Neighborhood Centers) are the focal points for commerce and social activities within the plan area and as such should provide a variety of business and daily services and public facilities. More intensive uses should be located in the urban areas and development in the rural centers should be smaller in scale and reflect a rural character. The existing combination of uses within the community centers is good but could be further diversified. When possible each community center should provide a mix between public facilities such as parks and recreation facilities, libraries, post offices, and fire stations, and commercial businesses such as retail shops and professional services. Co-location opportunities to provide a number of community centers should be explored and the development of farmers markets is highly encouraged.

**Land Use Policies**

**Goals**

The distribution and types of land uses in the plan area should reinforce the rural character of the area:
• Within commercial designations, concentrate commercial uses with higher intensity in the urban areas and lower intensity in rural areas.
• Identify the area at 224th St. E. and SR 161 as a primary commercial area, with commercial uses extending in all directions from the core, rather than in a strip pattern, and encourage new commercial development to occur first at the center of the core to maintain a rural character.
• Concentrate new residential development within the urban growth area to improve efficiency in providing public services, and limit multifamily development to specified locations in the UGA.
• Establish rural densities that are consistent with the rural character.
• Provide increased protection to sensitive natural resources through the use of a sensitive resource land use designation in areas subject to severe degradation when disturbed.

In the Urban Growth Area, allow for higher intensity uses that depend on urban level services while blending with Graham’s rural character.

**Agriculture and Aquaculture**

**GOAL GR LU-1** Promote agriculture activities throughout the rural portions of the plan area.

**GR LU-1.1** Parcels included in the Rural Farm should be a minimum of 5 acres in size.

**GR LU-1.2** Parcels that are located within a Rural Center or volcanic hazard area; within the Rural 5, Agricultural Resource Land, or Forest Land designation; or within a Mineral Resource Overlay should not be designated Rural Farm.

**GR LU-1.3** New parcels created within the Rural Farm should be a minimum of 10 acres in size.

**GOAL GR LU-2** Locate agricultural supply and product sales uses in designations/zones that are appropriate for the level, type, and intensity of the proposed use.

**GR LU-2.1** Limit agricultural supply sales of large scale or heavy equipment products, such as combines and tractors, to urban commercial and industrial areas.

**GR LU-2.2** Outside storage and display of products should be controlled and when necessary fenced to provide adequate screening.

**GR LU-2.3** Structures in Rural Activity Center zones should be of a scale not exceeding the rural center character.

**GR LU-2.4** Structures in Rural Neighborhood Center and Rural 10 zones should be very small scale.

**GOAL GR LU-3** Some smaller scale agricultural sales involving agricultural products such as produce, dairy products, flowers, etc., that are limited in size and products may be permitted in rural residential and agricultural areas.
GR LU-3.1 The intensity and design of structures that are used to sell produce and plants should be in an open air farmers’ market format or incorporated into a barn-like structure that maintains a rural character.

GR LU-3.2 Structures for produce and plant sales should be small in size, and outside storage and sales should be limited in scope and, when necessary, properly screened.

GR LU-3.3 Agricultural products should be grown or produced on-site or produced locally, but some small amount of other accessory retail sales may occur (e.g., value added products, products sold on consignment, handcrafted items, related wholesale sales).

GOAL GR LU-4 Apply a special review process to fish processing, hatcheries, and aquaculture uses in sensitive areas.

GOAL GR LU-5 Allow animal boarding for personal use.

GR LU-5.1 The number of animals should be based on the amount of land available to support the species.

**FORESTRY**

GOAL GR LU-6 Recognize forestry uses as a historic land use within the plan area and a desirable use to promote the rural character.

GR LU-6.1 Conduct commercial harvesting of forest products in rural residential and natural resource land areas.

GR LU-6.2 Retain the rural character by allowing Christmas tree farms in urban single-family, rural residential, and natural resource land areas.

GR LU-6.2.1 Limit the size of Christmas tree farms to no greater than 5 acres in SF.

GR LU-6.3 Locate forestry uses that involve the manufacturing of lumber and basic wood materials, etc. in Community Employment (CE) zones and through special review in Forest Land zones.

GR LU-6.4 Recognize historically authorized forestry-based industries such as Rainier Veneer and Viking Cabinets that were legally created and are now nonconforming uses, and allow these uses to remain and continue operations in a nonconforming status.

**INDUSTRIAL**

GOAL GR LU-7 Accommodate low intensity industrial uses within the plan area in locations where the mixture of uses can be internally compatible as well as adequately separated from surrounding non-industrial uses.

GR LU-7.1 Access these uses from a state highway or, when appropriate, a railroad line or airport.
GR LU-7.2 Uses should be of a type and scale that is consistent with a rural character.

GR LU-7.3 Prohibit residential uses within CE.

GR LU-7.4 Limit basic manufacturing uses to forest-based industries, which are classified under the Resource Use – Forestry category, within the plan area. Prohibit all other basic manufacturing uses within the plan area, as they exceed an intensity level that is desirable for the rural character.

GR LU-7.5 Locate contractor yards in urban commercial and industrial designations and in the Rural 10 land use designation.

GR LU-7.5.1 Adopt design and zoning standards and guidelines for contractor yards that address adequate screening and buffering requirements to enhance the aesthetic appeal of these uses.

GR LU-7.6 Allow small-scale food processing and packaging facilities in urban commercial and industrial zones, and in Rural Activity Center zone subject to special review. Allow small-scale breweries (micro-brews and brew pubs) and wineries as an accessory use for a restaurant.

GR LU-7.7 Provide for industrial services and repair facilities in urban commercial and industrial designations.

COMMERCIAL

GOAL GR LU-8 Commercial uses should provide a range of necessary businesses to the surrounding community. Concentrate commercial uses in urban centers (CE and Mixed Use District) and rural centers (Rural Activity Center and Rural Neighborhood Center) with recreational opportunities allowed in rural residential and forest areas.

GR LU-8.1 Provide adequate space within the plan area for commercial uses, and locate commercial uses primarily within urban centers or rural centers at a scale that is compatible with the surrounding uses.

GR LU-8.1.1 Prohibit billboards within the plan area.

GR LU-8.2 Designate and configure commercial areas based on consideration of the percentage of vacant and redevelopable land, existing developed uses, constrained land, distance to other urban or commercial areas, compatibility with surrounding uses, and projected population growth. In addition, apply GMA criteria for limited areas of more intensive rural development (LAMIRD) in evaluating rural centers and adjust rural center boundaries as follows:

GR LU-8.2.1 The Elk Plain Mixed Use District (east of SR 7 and 224th St. E.) shall remain as it currently exists.
**GR LU-8.2.2**  Modify the Meridian Mixed Use District (SR 161 north of 200th St. E.) to redesignate the properties that are either currently developed with residential uses or are not adjacent to Meridian to Moderate-High Density Residential (MHR).

**GR LU-8.2.3**  Modify the Graham Rural Activity Center (RAC) located at 224th St. E. and SR 161 to remove Frontier Park, properties owned by the school district, and the residential subdivision located in the northeast portion of the RAC. These parcels shall be redesignated to Rural 10. Additionally, modify this RAC to remove properties that are outside the logical outer boundaries of the rural commercial area based on those commercial uses that were established as of July 1990.

**GR LU-8.2.4**  Redesignate the Rural Neighborhood Center located at 208th St. E. and 54th Avenue E. to Rural 10.

**GR LU-8.2.5**  Revise the Rural Neighborhood Center located at SR 7 and 260th St. E. to remove the two vacant parcels north of 260th St. E. Redesignate these two parcels to Rural 10.

**GR LU-8.2.6**  Redesignate the Rural Neighborhood Center located at SR 7 and SR 702/352nd St. E. to Rural 10.

**GR LU-8.2.7**  Retain the Benston RAC (SR 161 and 304th St. E.) and the remaining Rural Neighborhood Centers at Johnson’s Corner (SR 7 and 304th St. E.) and Kapowsin (Orting-Kapowsin Hwy. and Kapowsin Hwy E.) in their current locations if they meet the LAMIRD criteria.

---

**RESIDENTIAL**

**GOAL GR LU-9**  Residential areas should provide a range of uses from urban levels of density to lower rural residential densities.

**GR LU-9.1**  The scale of density should provide a step-down transition from the higher densities in the South Hill Community Plan area and reflect a rural feel.

**GR LU-9.2**  Residential density within the SF zone shall be 4 dwelling units per acre.

**GR LU-9.3**  Apply a lower rural residential density in volcanic hazard areas and environmentally sensitive areas.

**GR LU-9.4**  Apply a Rural Sensitive Resource (RSR) designation to open space corridors within rural residential designations to reduce impacts associated with development.

**GR LU-9.4.1**  Establish a RSR zone on rural residential properties located within the open space corridor that contain at least 50% of designated open space corridor area.

**GR LU-9.4.2**  At a minimum, the RSR zone should extend 500 feet in all directions from any wetland, stream, or surface water utilized for open space corridor designation.
Delineate the RSR zone using parcel boundaries.

Exclude small lots that are located within previously platted lands from the RSR unless they are contained within the main portion of the open space corridor (i.e., connectivity should be maintained).

Monitor and adjust, as needed over time, those lands given the RSR zoning designation. Lands may be added or removed from this zoning designation as information regarding the environmental carrying capacity of the land and the sensitivity of the environment changes over time.

Low density single-family housing shall be allowed to occur in RSR zones.

Limit the base residential density to 1 dwelling unit per 10 acres.

Provide bonus densities within RSR at 2 dwelling units per 10 acres when 50% of the property is set aside as permanent open space.

Ten-acre lot sizes are preferred.

Limit land uses within the Rural Sensitive Resource designation to low density residential uses and natural resource uses, and consider uses that minimize impacts in the RSR zone.

Limit land uses within the RSR designation to single-family residential, agriculture, forestry, selected civic uses such as organizational camps, and public nonmotorized recreational facilities. Prohibit commercial and industrial development.

Require a special review process to elicit greater public involvement in the issuance of permits for certain land uses within RSR. Prohibit uses that may have potential impacts to the surrounding environmental systems within RSR.

Encourage uses that create minimum impacts to the integrity of the open space corridor such as pervious trails.

Encourage uses that do not involve significant buildings or impervious surfaces such as farming and forestry.

Provide incentives to consolidate parcels to be consistent with rural densities.

Investigate streamlining the lot combination and lot boundary line adjustment application processes.

Utilize the Rural 20 (R20) designation to provide for lower residential densities and intensities of uses within volcanic hazard areas.

Prohibit Master Planned Resorts within R20.

Promote necessary civic uses within the plan area that are compatible with the designated and surrounding uses and natural environment.
GR LU-12.1 Allow administrative government services in urban commercial and industrial designations and Rural Activity Centers.

GR LU-12.2 Provide for daycare centers in close proximity to residential areas at an appropriate scale for the surrounding area while protecting children from incompatible uses and volcanic hazard areas.

GR LU-12.3 Locate community and cultural services in commercial centers and districts, organizational camps in Rural Sensitive Resource areas, and small-scale services in residential areas.

GR LU-12.4 Provide for educational facilities in close proximity to residential areas at an appropriate scale for the surrounding area while protecting children from incompatible uses and volcanic hazard areas.

Zoning Overlays

Open Space Corridor Overlay

GOAL GR LU-13 Develop special overlay standards to protect the environmentally sensitive areas or other special interest areas from incompatible uses.

GR LU-13.1 Include environmentally sensitive features on the open space map, and promote protection measures within these open space corridors.

GR LU-13.2 Apply environmentally sensitive design techniques within open space corridors and RSR zone.

GR LU-13.2.1 Apply low impact development standards as outlined in the Pierce County Site Development and Stormwater Management Manual within open space corridors and RSR zone to address best management practices such as site development (clearing, grading, and tree removal), maximum impervious surface coverage, and minimum vegetation retention.

GR LU-13.3 Require open space in new residential development.

GR LU-13.4 Limit allowable uses within open space areas to minimize impacts and enhance passive recreational experiences. Allow the following uses within designated open space areas in this priority:

GR LU-13.4.1 Preservation of natural vegetation, including fish and wildlife habitat;

GR LU-13.4.2 Critical areas protection, including steep slopes and aquifer recharge areas;

GR LU-13.4.3 Buffers between incompatible land uses;

GR LU-13.4.4 Passive recreation (pervious and impervious trails);

GR LU-13.4.5 Active recreation;

GR LU-13.4.6 On-site utilities (drainfields, stormwater retention facilities); and

GR LU-13.4.7 Pedestrian, equestrian, and bicycle trails.
GR LU-13.5 Reduce the amount of density or intensity allowed within a proposed development that lacks permanently designated usable open space.

GR LU-13.6 Permit pedestrian, equestrian and bicycle trails within designated open space tracts.

GR LU-13.7 Utilize the Comprehensive Plan Open Space Corridors Map as the basis for establishing open space overlay corridors within the plan area.

GR LU-13.8 Use open space corridors to connect wetlands and areas with hydric soils that recharge streams and groundwater.

**IMPLEMENTING ACTIONS**

The following list of actions needs to be completed in order to implement the policies contained within this plan. They are arranged according to the timeframe within which each should be completed: short, medium, or long term. Short-term actions should occur within one year of plan adoption. Mid-term actions should be completed within 2-5 years. Long-term actions should be completed within 5-10 years of plan adoption. The entity or entities responsible for leading the effort to complete the action item is listed in parenthesis following the action. Actions are assigned to the Land Use Advisory Commission (LUAC), Pierce County Planning and Land Services (PALS), Pierce County Economic Development (ED), Pierce County Parks and Recreation (Parks), Pierce County Public Works & Utilities (PWU), and Tacoma-Pierce County Health Department (TPCHD).

**SHORT TERM ACTIONS (UPON PLAN ADOPTION TO 1 YEAR)**

1. Amend the Pierce County Comprehensive Plan to adjust land use designations according to plan policies and maps. (PALS)
2. Amend the Pierce County Comprehensive Plan to:
   - Revise the open space corridor map for the Graham Community Plan area.
   - Establish a Rural Farm designation.
   - Revise land use designations per the adopted community plan. (PALS)
3. Amend the Pierce County Development Regulations – Zoning to:
   - Establish the allowed uses in zone classifications per the plan policies.
   - Establish densities and dimensions for the zone classifications.
   - Amend the zone classifications to include Graham Community Plan zones.
   - Amend the agricultural supply sales use category to create new levels.
   - Amend other community plan zone classification tables to reconcile the new agricultural supply sales levels. (PALS)
4. Amend the Pierce County Zoning Atlas to adjust the zones for the Graham Community Plan area and extend the Airport Overlay for Thun Field to the Graham Community Plan area. (PALS)
5. Amend the Pierce County Development Regulations – Natural Resource Lands to clarify that agricultural lands include both Agricultural Resource Land and Rural Farm designations. (PALS)
6. Amend the Pierce County Development Regulations – Design Standards and Guidelines to provide open space dedication requirements. (PALS)

**MID-TERM ACTIONS (1-5 YEARS)**

1. Work with the Pierce County Assessor-Treasurer’s Office to reconcile property taxation with existing zoning and allowed uses pursuant to what is allowed in the zone. (PALS, Assessor-Treasurer’s office)
2. Amend the Pierce County Comprehensive Plan to address General Aviation Airport issues for the Shady Acres Airport. (PALS)

**LONG TERM ACTIONS (5-10 YEARS)**

1. Map potential mineral resource lands within the community plan area and develop Mineral Resource Overlay (MRO) standards. (PALS)

- Underdeveloped Land
- Redevelopable Land

Source: Pierce County Assessor/Treasurer Land Use Code Information

Note: Redevelopable commercial and industrial parcels are zoned for commercial or industrial uses with a land value greater than or equal to the improved value. Underdeveloped residential parcels are either zoned for residential uses where the existing land use is residential, with an area greater than or equal to one acre, or zoned for commercial that allows residential uses where the existing land use is residential with an area greater than or equal to one-quarter acre. Underdeveloped only applies to urban land use designations.

Chapter 3: Community Character and Design Element

INTRODUCTION

The character and design found within a community reflects many aspects of the citizens who live there. Some areas feel urban while others have a distinctly rural flavor. The character and design of an area often provides a glimpse into fundamental values and preferences for social interactions. Simply put, character reflects the heart and soul of a community.

Community design deals with the physical elements that compose the character of the community in terms of the look and feel. These physical elements include streets, parks, buildings, open space, and neighborhoods. Through community design policies, individual improvements, such as street construction, park development, land use regulation and new commercial, industrial, residential and civic development can be effectively coordinated with each other to promote a unified community image. Good design invites human presence, allowing for interaction of people and recognizes the functional and visual links between developments. Poorly designed development tends to hinder the development of desired land uses, stifles the human component, and often leads to future blighted areas.

The historic and cultural resources contained within a community provide a sense of place and can also create a link to the community’s character. These sites and structures can be highly valued and integrated into new development or when preservation is not possible or appropriate more generally incorporated into the overall design theme or style of a community.

DESCRIPTION OF CURRENT CONDITIONS

Historically, the greater Graham area has been characterized as rural and agricultural. While the northern and northwest portions of the plan area have experienced urban growth, the rest of the plan area has remained in a large lot, rural residential, or agricultural land use pattern. There are many farms (both hobby farms and commercial farms) and outdoor recreational areas surrounding the many lakes. In fact, it is still common to see people riding horses or enjoying other types of outdoor recreational activities such as biking and boating. Views of Mount Rainier, called Tahona by the indigenous Native Americans, are prominent from many locations within the plan area, and in some cases are quite spectacular.
COMMUNITIES

There are many small communities that are located within the plan area. Some of these communities, such as Elk Plain and Graham town center, have experienced development pressure over the last few decades and therefore are more urban in nature, design, and feel. The more rural portions of the plan area contain many smaller communities such as Thrift, Kapowsin, Rocky Ridge, and Johnson’s Corner that reflect a historic rural character, often with older buildings and no amenities. These areas commonly contain one or two commercial or civic structures like a little grocery store or a grange.

HISTORIC AND CULTURAL RESOURCES

Historically, meeting places, markets, stores, and landmarks were located at crossroads that accommodated access, commerce, and communication among people and communities. Many of the communities throughout the plan area, such as Thrift, Graham, Elk Plain, Tanwax, Kapowsin, and Benston, have considerable early history providing these functions.

Preservation and enhancement of special and unique features and places that relate to a community’s heritage can bring economic benefits to the community through stimulating internal and external investment, increased visitors and promoting tourism in general, and by increasing pride among the community members. A variety of historic preservation activities throughout a community can support the efforts for resource conservation and also help improve quality of life. Examples include restoration of an old farm house, reuse of a historic schoolhouse or grange, rehabilitation of an old store and retaining its commercial use through compatible commercial additions, and incorporation of historic resources and landmarks into new recreational resources and facilities, including trails or scenic bike or auto routes.

There are a number of federal, state and local laws and programs that apply to historic and cultural resource preservation. Locally, the Pierce County Cultural Resource Inventory provides an indication of those properties or structures that may hold historical or cultural significance. Table F-14 and Map F-21: Historic Resources identify historic and cultural resources within the plan area. These resources include one room schools, stores, post offices and pony express stations, homes of notable persons, noteworthy or rare surviving examples of architectural styles or construction methods or materials from a historic period, farmsteads with assemblage of farm buildings, cemeteries and granges.

Key: “b.” indicates year built; “Adj. b.” indicates adjusted year built

It should be noted that this inventory of historic and cultural resources is intended to be a preliminary list of resources of potential historic significance. Additional detailed individual property-based research is necessary to determine its eligibility for listing in a historic register. Further, other resources may be added to this list in the future based on additional research.

COMMERCIAL, CIVIC, AND INDUSTRIAL DESIGN

The commercial, civic, and industrial uses within the plan area have developed without any consistent architectural style or site design standards. The layout of building structures within some developments inhibits both vehicle and pedestrian movement. Some developments are experiencing problems with stormwater flooding, inadequate ingress/egress (both externally and internally), and pedestrian safety (limited sidewalks and crossways). There are little or no landscaping or pedestrian amenities within some developments. The commercial areas within
the two Rural Activity Centers reflect a more urban design in terms of building architecture, stormwater facilities, signage, and lighting.

**Residential Design**

The residential stock within the plan area contains a wide mixture of site and architectural design. Some of the newer subdivisions have a more monotonous architectural theme and are situated on small lots, devoid of native trees and vegetation. However, most of the housing stock sits on farms or large country estates, depicting a “gentleman farm” character. Occasionally, residences are used for home occupations and cottage industries.

**Signs**

As with commercial design issues, signage throughout the plan area lacks any sense of consistent style or order. Some businesses use standard corporate logos and designs which reflect “Anywhere, USA” instead of a rural character. Many of the buildings are plastered with random signage. The proliferate use and combination of sandwich boards, banners, streamers, blinking lighting, and temporary signage creates a cluttered cacophony that is visually disturbing to traveling motorists and citizens who are shopping or using other services. Signs are also attached to public utility poles and fences outside of designated commercial and industrial areas, which detract from the rural character. In some instances signs don’t match the businesses they intend to advertise, are made of unattractive materials/colors, contain information that is misspelled, or are in a state of disrepair (rusty, broken, ripped, outdated, etc.).

**Trees and Vegetation**

Within the more urban portions of the plan area (far north and northwest), trees and vegetation have been removed during the development process and little or no landscaping has been installed to replace what was lost. Stormwater facilities, often constructed as rectangular pits, are devoid of any vegetation. The rest of the plan area still retains a fair amount of vegetation, in a mix of native trees and understory and agricultural pastures and crops.

**VIEWSHEDS AND AESTHETICS**

Scenic views of Mount Rainier, the Cascade Mountain range, pastoral and agricultural settings, lakes, and other natural areas are abundant throughout the plan area. On Graham hill, the Olympic Mountain range and sunset vistas to the west can also be viewed and enjoyed. Old barns and log cabins are scattered throughout and also reflect the area’s historic rural and agricultural character. Unfortunately, junk cars and other types of debris can also be found abandoned along roadways and on properties, which creates an eyesore and nuisance to residences and tourist travelers.

**DESCRIPTION OF DESIRED CONDITIONS**

**HISTORIC AND CULTURAL RESOURCES**

Historic and cultural resources provide a link to the community’s rural and natural resource-oriented past. Structures and sites with historical or cultural significance should be retained and when feasible restored and integrated into new developments. Historic and cultural resources should receive special attention and review during the permitting process on any proposals for alterations, additions, or demolition. Signage should be installed to identify historic or cultural resources. Roads that were used as historical routes or trails should also be clearly marked. A historical society should be created to promote preservation of designated historic and cultural resources and provide education to citizens, schools, and tourists regarding the historic past of the plan area.

**DESIGN**

**DESIGN STANDARDS**

New development and structures should respect and complement the existing rural and agricultural character through the use of appropriate site design, fencing, construction materials, architectural design, signage, setbacks, and placement of structures. Site and architectural design standards and guidelines and sign regulations should be implemented to foster the rural character and a unified sense of design in a manner that embraces individual flexibility. The concept of themed communities or franchise-type development is discouraged.
**SITE DESIGN**

Areas of existing vegetation and soils should be preserved and integrated into new developments to help maintain natural hydrologic functions and ecosystems and the rural character. Where preservation of native soils and vegetation is not feasible, native plants should be utilized in the landscaping to maintain the natural character. Clearing and grading activities should be prohibited prior to permitted building activity, except for installation of roads and infrastructure, and the amount of cut and fill should be minimized to the greatest extent possible. Existing critical areas and associated buffers should be maintained and integrated into the site design. Low impact development techniques should be utilized to address stormwater drainage issues and the use of traditional conveyance and pond systems should be minimized. Where detention and retention stormwater facilities are used, these facilities should be designed to resemble natural wetland systems, employing gentle slopes and native trees and vegetation in the overall design. Buildings and infrastructure should be oriented on the site to respond in the best manner to natural elements such as sun, wind, and rain. When possible, building structures should be grounded or “nestled” into the landscape and clustered in pockets with open space situated towards any major road to preserve the rural character. Siting buildings on ridgelines should be avoided to protect the visual quality of skylines.

**RESIDENTIAL DESIGN**

Residential development should reflect the rural character of the plan area. In the urban portions of the plan area, residential designs should provide for urban amenities such as sidewalks, street trees, street lights, adequate on-street and off-street parking, school bus kiosks, and neighborhood park and recreation facilities. The scale and intensity of urban residential development should be reduced to provide a transition between the higher intensity residential uses typically found in South Hill and the rural portions of the plan area. Rural residential development should occur in a larger lot pattern and reflect a variety of rural or agricultural character through the use of design features such as covered porches and verandas. Common open space areas should be integrated into residential developments to preserve critical areas and preserve a rural feel. Design and architectural standards and guidelines should be developed for urban single-family and multifamily residential developments and to prevent monotony of dwelling units along streetscape. Home occupations and cottage industries should be allowed but only in conformance with standards that ensure these uses reflect and maintain an appropriate residential character.
Commercial, civic and industrial uses should be designed in compact nodes with an architectural style that reflects the rural character of the plan area. Architectural features such as covered entryways, walkways, sloped or stepped roof and porch designs should be integrated into storefronts and the use of wooden or natural construction materials should be incorporated to elicit a rural town feeling. All pedestrian walkways and access areas should be clearly signed, lighted, and delineated on the concrete or asphalt to promote pedestrian safety. Commercial developments should incorporate pedestrian amenities such as benches, trash receptacles, fountains, and plazas. Service areas and lighting should be designed to minimize any impacts from glare, odor, and noise through the use of appropriate location, setbacks, landscaping, fencing or screening methods, and orientation. Similarly, the mechanical and HVAC equipment for a building should be screened from public streets, building approaches, and adjacent properties.

Native plants and trees, integrated into the landscaping design, should be used to soften the built environment and enhance the pedestrian experience. Natural landscaped areas should be placed between proposed development and adjacent public streets or residential development. Buildings situated on sites that have sloping topography should follow the natural terrain in a manner that minimizes earth disturbance and integrates the building into the site.

Parking facilities for commercial uses should provide for adequate parking and include some larger spaces that accommodate bigger vehicles such as trucks, RVs and truck-trailer combinations. Landscaping within parking lots should include the use of native vegetation and trees which would provide shade during the summer months. These planting areas should be constructed in bio-retention facilities that could serve a multi-function use as stormwater facilities. The use of pervious pavements for parking lots is also encouraged to help reduce stormwater impacts. Parking areas for new commercial developments should be connected to other commercial parking facilities to increase access between commercial areas and decrease the number of access points on major arterials.
**SIGNS**

The amount, scale, and type of signage within commercial and industrial areas should be controlled in a manner that promotes a unified appearance and rural character. The use of natural materials, such as stone and wood, and colors should be integrated into the design of signage. The number and size of signs affixed to buildings and freestanding signs located adjacent to buildings should be limited. Murals on the sides of commercial buildings that reflect the community’s rural and natural resource industrial history are encouraged. Signage should be maintained to keep up visual attractiveness and old signage that is in a state of disrepair should be updated.

Signs should also be used to better convey information throughout the community plan area. Individual communities, such as Elk Plain, Graham, Thrift, Kapowsin, Rocky Ridge, etc. should contain signage at the entry points to identify them as distinct communities and mark any historical significance. The amount and quality of informational signage within the plan area should be improved. Directional signage could be installed to point out cultural and historic resources and historic routes and trails, as well as other points of community interest. Animal warning signs should be posted to notify traveling motorists of potential accident areas where deer and elk crossing is common.

**FISH/WILDLIFE HABITAT AND DEVELOPMENT**

The amount of disturbance to sensitive fish and wildlife habitat areas should be avoided or greatly minimized through a conscientious design process. Open space areas should be used in key locations to maintain fish and wildlife habitat and roadway systems and clusters of development can be located in areas where the least amount of impact will occur. In particular, roads, bridges, and culverts should be designed so that these systems will not block or impede the passage of fish or wildlife.

**VIEWSHEDS AND AESTHETICS**

Maintaining views and a pleasant looking environment is an integral component of protecting the quality of life within the plan area. Views of important scenic resources within the plan area, such as Mt. Rainier, should be preserved during any future development process as well as views of rural elements such as pastures. To accomplish this, design standards should be implemented that guide placement of structures, structure height, and tree removal/cutting and all utilities should be placed underground. Junk and debris that is located throughout the plan area should be removed and adequate requirements should be adopted to screen unsightly outdoor storage from public view. New wireless communication facilities should be limited or screened to preserve the rural character of the plan area. The type, location, and
style of fencing within the plan area should be regulated to ensure that any new fencing promotes the rural character.

**Open Space and Greenbelts**

Open space areas should be conserved through application of design standards that minimize environmental and visual impacts of proposed development. Some ideas include the use of low impact development techniques, preservation of native vegetation and soils, nestling structures to blend into the landscape, and green building techniques. Open space areas should be set aside into separate tracts of land and signage to indicate that it is being maintained as open space. Whenever possible, open space tracts should be connected to provide wildlife movement corridors. Greenbelts should be used for passive recreation and to provide buffers between uses and visual relief from the built environment.

**Cultural Resources Policies**

**Goal GR CR-1** Recognize and preserve existing places and structures of historic and cultural significance within the plan area, thereby strengthening the area’s character and sense of place.

**GR CR-1.1** Recognize the unique characteristics of individual communities within the plan area.

**GR CR-1.2** Retain existing distinctive and historic rustic structures such as farm buildings and log cabins.

**GR CR-1.3** Encourage a diverse mix of rural architecture that currently characterizes the plan area.

**GR CR-1.4** Discourage themed communities in the plan area.

**GR CR-1.5** Promote the history of the plan area through special events and maintaining unique structures.

**GR CR-1.6** Acknowledge the history of the community within proposed designs.

**GR CR-1.7** Encourage school districts to consider school names that reflect the history of the surrounding area.

**GR CR-1.8** Consider whether roads located within the plan area could be designated as historic routes or trails.

**GR CR-1.9** Investigate the feasibility of designating Kapowsin as a historic district.

**GR CR-1.10** Encourage protection and preservation of recognized landmarks and buildings through a variety of incentives, including financial, aimed at rehabilitation or restoration that meets standards.
GR CR-1.11 Encourage selection of sites that include historic resources of architectural, historical, or archeological value, for public projects involving housing, parks and recreational use, education, or civic facilities as long as the projects do not negatively impact the protection of sacred sites of religious significance or traditional cultures.

GR CR-1.12 Establish linkages to public institutions, private individuals, and non-profit, locally-based organizations to increase opportunities for cultural enrichment with a heritage component; utilize the local community to initiate and organize cultural and other programming and activities including festivals, street fairs, performances, conferences, classes, workshops, trips, tours, etc.

GR CR-1.13 Pursue the creation of a historical society for the communities of Graham, Kapowsin, Thrift, Elk Plain, Rocky Ridge, etc. located within the plan area.

GR CR-1.14 Identify historic sites through the use of signage.

**Design and Character Policies**

**Goals**

- Enhance the rural character of the plan area and preserve the history of the area.
- Preserve the natural feel and scenic beauty of the plan area. People choose to live in Graham and the surrounding area because they like the feeling of being in the country.
- Establish development standards that encourage a variety of building designs suitable to the area’s rural character, preserve open space and greenbelts, and promote surface water management using low impact development techniques.
- Support the development of a transportation network that provides for ease of travel throughout the community, convenient access to commercial centers, and a variety of modes of travel linking schools with other areas, using a variety of native plants to maintain a scenic appearance for people using the roadways.
- Ensure that signs in the plan area are at a scale and design appropriate to a rural atmosphere, while accommodating the need to provide information on events, activities, and businesses in the community.
- Promote opportunities to increase public appreciation and awareness of the history of the Graham area, encourage preservation of historic sites and structures, and promote the continuation of traditional public events.
- Designate a community service area in central Graham to accommodate a community center, recreation opportunities, museum, visitor information, and social services.
- Recognize that the Graham Community Plan area serves as a gateway to Mount Rainier and provides a transition from the higher density/intensity Urban Growth Areas to rural and resource areas.
GOAL GR D-1   Guide development in a manner that will further enhance the existing rural character and identity of the plan area. Compatibly design proposed residential, commercial, civic, and industrial development within the visual context of the surrounding area and be sensitive to existing uses and site conditions.

GR D-1.1   Site plans for all proposed multifamily, commercial, civic, office/business, utility and industrial developments shall clearly illustrate all proposed buildings, landscaping, tree retention and replacement areas, critical areas and associated buffers, parking areas, lighting, utilities, stormwater facilities, access points and streetscapes, public spaces or common areas, pedestrian amenities, loading areas, trash and recycling collection areas, fencing, sidewalks and walkways, bikeways, and adjacent properties.

GR D-1.2   Site plans for all proposed land divisions shall include items such as proposed lots, building areas, landscaping, tree retention and replacement areas, critical areas and associated buffers, parking areas, lighting, utilities, stormwater facilities, access points and streetscapes, public spaces or common areas, on-site recreational areas, native vegetation retention areas, buffers, fencing, sidewalks and walkways, bikeways, and adjacent properties.

GR D-1.3   Establish architectural standards and guidelines and an architectural design plan review and approval process for proposed urban single- and two-family, multifamily, commercial, civic, office/business, utility, and industrial developments.

GR D-1.4   Require proposed lighting to be reviewed during the design review process to ensure compatibility between adjacent uses and minimize glare impacts onto roadways and critical areas.

GR D-1.5   Create design standards for pedestrian amenities which enhance the quality of sidewalks and outdoor gathering spaces within the various rural commercial centers.

GOAL GR D-2   Encourage site design that responds to the existing character and conditions of the site and maintains the rural character.

GR D-2.1   Preserve natural character, functions, and values during the development process through techniques such as low impact development.

GR D-2.2   Maintain the rural character of the plan area’s distinctive natural environment by preserving open space, greenbelts, lakes, streams, wetlands, and agricultural areas.

GR D-2.3   Preserve areas of native vegetation and existing stands of large trees by requiring integration within proposed developments.
GR D-2.4 Provide incentives to preserve open space, native tree stands, and vegetation.

GR D-2.5 Where feasible, retain existing native vegetation in commercial centers to maintain the natural character.

GR D-2.6 Require that native vegetation be re-established on properties where unpermitted clearing has occurred.

GR D-2.7 Minimize the amount of cutting and filling on a site to ensure that the natural topography of the land is retained.

GR D-2.8 Align roads and developments to follow the natural contours of the site.

GR D-2.9 Prohibit clearing, grading, and vegetation removal in residential developments, except for construction of roads and utilities, until building permits are issued.

GR D-2.10 Incorporate critical areas and associated buffers, significant trees or stands of trees, or other important natural features into the site design.

GR D-2.11 Encourage the utilization of low impact development measures.

GOAL GR D-3 Retain native trees and vegetation and install additional landscaping to foster the rural character.

GR D-3.1 Reinforce the rural character of the plan area through the use of native plant species.

GR D-3.2 Increase the quantity of plantings within parking lots to meet screening, buffering, and functional requirements.

GR D-3.3 Emphasize the use of native plant species in landscaping design.

GR D-3.4 Provide credit for the retention of significant trees and good native vegetation in place of new landscaping.

GR D-3.5 Provide native plantings around entry signs to communities in the plan area to enhance the appearance of the entry.

GR D-3.6 Comply with countywide standards for maximum impervious surface, minimum native vegetation, and tree retention.

GR D-3.7 Salvage and replant native plants that lie in the path of development.

GR D-3.8 Plant native shrubs and trees in a design that mimics the historic natural landscape and vegetative pattern.

GOAL GR D-4 Maintain natural hydrologic cycles and functions during the development process.

GR D-4.1 Design storm drainage facilities that mimic hydrologic/environmental functions while providing adequate treatment and collection.

GR D-4.2 Design stormwater management facilities to resemble natural features by incorporating gentle side slopes, curvilinear geometry, and native vegetation.
Encourage the use of low impact development techniques which enhance the natural characteristics of the plan area and better manage storm drainage at the source to preserve native forest vegetation and minimize impervious surfaces in development.

Maintain predevelopment flow path lengths in natural drainage patterns, wherever possible.

Minimize the use of traditional conveyance and pond technologies to manage stormwater quality and quantity.

Minimize the potential impacts of runoff to existing waterways.

Ensure that appropriate erosion sedimentation controls are provided in concert with proposed development.

Integrate small, dispersed bioretention areas to capture, store, and infiltrate stormwater on-site.

Site buildings and infrastructure to respond to natural elements (e.g., sun and wind), reduce visual impact, and maintain rural character.

Orient space, streets, parking areas, buildings, and groups of buildings to take full advantage of the sun for winter warmth and mitigation of summer heat. When possible, place buildings to the north of outdoor spaces with opportunities for dappled shade from trees or trellises.

Configure streets and plazas to reduce the effect of winds on the plaza.

Locate buildings at the toes of slopes and edges of meadows to allow for natural windbreaks and create a feeling of shelter.

Cluster development to maximize visually significant, unfragmented open space.

Nestle structures below ridgelines, behind natural vegetative screens, and within the folds of hills. Where natural vegetation and topography do not allow for hiding development, locate structures in subordination to the horizon and any significant viewsheds.

Avoid siting buildings on prominent ridges to protect the visual quality of skylines and ridgelines.

Prohibit placement of building lots in floodways and floodplains.

Encourage residential design that responds to the existing character and conditions of the site and evokes a rural character.

Encourage large lot residential development in a style consistent with the rural character of the plan area.

Encourage residential developments to include school bus kiosks.
Encourage small farms, ranches, and a homestead character.

Develop specific design guidelines for single-family and multifamily residential development to address site planning and building placement. Single-family guidelines should provide for retaining the existing rural character of homes in the plan area.

Enhance the visual quality of neighborhood streetscapes through the use of tree planting and installation of native vegetation.

Encourage dwelling units that utilize architectural features, including porches and verandas which contribute to the country feeling of the plan area.

Encourage a broad variety of architectural styles that reflect the diversity of residents, yet maintain compatibility within projects.

Provide incentives for innovative architectural design.

Avoid monotonous street fronts in residential developments.

Vary the street front facades and colors of structures within the same block.

Provide and incorporate common open space areas between clusters of homes.

Open space area may encompass environmentally sensitive areas or rural farm/pasture land areas.

Connect open space areas with clusters of homes through a system of walking trails.

Consider placing the largest and most architecturally significant homes on corner lots designed with wrap-around porches.

Provide road and/or pedestrian and bike connections between subdivisions and when possible, share common open space in order to foster a sense of neighborhood.

Maintain adequate side yard setbacks

Side yard setbacks should be at least 10 feet on either side of the structure.

Provide perimeter buffers of native vegetation in new residential developments.

Perimeter buffers should be a minimum of 50 feet.

Design residential developments to allow service providers, such as fire and rescue equipment and personnel, waste and recycling collection vehicles, and school and transit buses, adequate access to conduct operations.

When structures are located closer than 5 feet of the property line or within 10 feet of each other, require fire-resistant materials (with a minimum of a one-hour fire rating) on the exterior of homes (including walls, eaves, and roofing) and sprinkler systems (minimum of NFPA 13D specifications).
GR D-6.15.2 No portion of the building setback, including decks, tip-outs, bay windows, and rofflines, should project into the building setback when homes have been allowed a variance or Planned Unit Development exception to build closer than the 10 foot side yard setback requirement.

GR D-6.15.3 Privacy fencing should contain an emergency gate access into the backyard space to allow access by fire and rescue personnel.

<table>
<thead>
<tr>
<th>Commercial, Civic, and Industrial</th>
</tr>
</thead>
</table>

**GOAL GR D-7** Encourage high quality, compact commercial, civic, and industrial development consistent with the rural character of the plan area.

**GR D-7.1** Create compact nodes of development appropriate to the scale and character of the surrounding rural areas.

**GR D-7.1.1** Connect buildings to create compact commercial, civic, and industrial development.

**GR D-7.1.2** Encourage campus layout of commercial, civic, and industrial developments.

**GR D-7.1.3** Incorporate historic or cultural resources into the site design.

**GR D-7.1.4** Concentrate community facilities around public squares or plazas at the intersection of community roadways or pathways.

**GR D-7.1.4.1** When possible, place major civic buildings around or near these public squares or plazas.

**GR D-7.2** Retain or create buffers of native vegetation between proposed developments and any adjacent public streets or existing residential developments.

**GR D-7.2.1** Buffers shall be a minimum of 35 feet wide.

**GR D-7.3** Service areas and outdoor storage areas shall be located in the rear of buildings and screened from adjacent properties, public streets, or public spaces.

**GR D-7.3.1** Trash/recycle areas and outdoor storage areas shall be screened with solid type fencing (e.g., board on board or stone/concrete) or dense vegetation at least 6 feet high.

**GR D-7.3.2** Loading docks shall be screened from adjacent properties and public streets through the use of densely vegetated buffers.

**GR D-7.4** Utilize separated walkways through parking lots or other motorized vehicle travel ways.

**GR D-7.5** Provide lighting in all commercial, civic, and industrial developments that is compatible with surrounding development and enhances personal safety.

**GR D-7.5.1** Direct all parking area or building lighting to prevent glare toward public streets, public open spaces, wetlands, fish or wildlife habitat areas, or adjacent properties.
**GR D-7.5.2** Lighting in parking areas and around buildings should provide an adequate amount of illumination to provide a feeling of safety.

**GR D-7.5.3** Consider the use of softer colored or diffused lighting instead of bright fluorescents.

**GR D-7.5.4** Require proposed lighting to be reviewed during the design review process to ensure compatibility between adjacent uses and minimize glare impacts onto roadways and critical areas.

**GR D-7.6** Design commercial, civic and industrial buildings and structures to reflect the rural character and to be compatible with surrounding uses.

**GR D-7.6.1** Diversify the scale and mass of proposed buildings through the use of architectural details such as covered entryways, overhangs and projections, building modulation, etc.

- **GR D-7.6.1.1** Break up large buildings with facade modulation.
- **GR D-7.6.1.2** Large box-style buildings are highly discouraged.
- **GR D-7.6.1.3** Avoid building large, monolithic structures. Buildings should comprise a complex of smaller buildings or parts that manifest their own internal social realities.
- **GR D-7.6.1.4** Vary the roof pitches, with the largest roofs over the main portion of the building and lesser, shallower roofs at the outer edges of the structure.

**GR D-7.6.2** Encourage the use of wood or other natural materials finished in natural colors in rural town or ranch houses appropriate to the rural character.

- **GR D-7.6.2.1** Use natural materials that reflect an organic integrity and harmony with the natural surroundings.
- **GR D-7.6.2.2** Stone and wood are appropriate as primary construction materials.
- **GR D-7.6.2.3** Muted natural colors are important to help buildings in prominent locations blend in with the surrounding landscape.
- **GR D-7.6.2.4** Avoid using multiple building materials and colors to prevent commonality and monotony of design.

**GR D-7.6.3** Require development on sites with more than one structure to employ similar, compatible, and complimentary architectural style, scale, form, color, use of materials, and detailing.

**GR D-7.6.4** Reduce the apparent scale of large commercial, civic, or industrial structures located adjacent to residential development through the use of techniques such as building placement, design, landscaping, and modulation of roof heights and scale. The use of architectural design features and scale reflective of rural residential building characteristics is highly encouraged.
GR D-7.6.5 Employ designs that evoke a rural feeling including the use of natural materials, appropriate scaling, and bulk limitations.

GR D-7.6.6 De-emphasize corporate logos or designs to better fit the rural character of the community.

GR D-7.6.7 Employ a variety of measures to provide visual interest such as bas relief or mural-type artwork, water features, a mixture of building materials and coordinated colors, roof treatments, cornices, window treatments, landscaping, etc. Place special details or features on large blank walls visible from pedestrian walkways and parking areas.

GR D-7.6.8 Locate or screen all mechanical or HVAC equipment, utility meters, electrical conduit, and any other exterior equipment to minimize visibility from public streets, building approaches, and adjacent properties.

GR D-7.6.9 Provide pedestrian-friendly facades on the ground floor of all buildings that orient toward public streets, public spaces, and parking areas. Utilize pedestrian-scale lighting, signage, covered areas, and other amenities.

GR D-7.6.10 Ensure that lighting within the overall development is appropriate to the architectural style and is consistently integrated.

GR D-7.6.11 Encourage the preservation and integration of historic structures into the overall architectural design.

GR D-7.6.12 Build arcades at the edge of buildings to provide shelter from sun and rain and to ease the transition between public and private space.

GOAL GR D-8 Provide parking facilities that are adequate to meet the needs of local businesses while minimizing conflicts between automobiles and pedestrians.

GR D-8.1 Ensure that there are clear indicators for internal intersections to maintain safety, including yield signs, stop lines/bars, and other methods to help direct traffic flow within parking areas.

GR D-8.2 Minimize visual impacts of parking lots through the use of landscape islands and plant materials.

GR D-8.3 Design parking lots to accommodate larger vehicles common to the rural areas.

GR D-8.4 Utilize cut-off parking lot lighting to reduce glare.

GR D-8.5 Encourage the use of permeable paving surfaces such as porous pavement for roads, driveways, and parking lots.

GR D-8.6 Utilize bioretention areas within parking lot design.

GR D-8.7 Ensure that parking lot design and circulation are appropriate to the rural scale of the surrounding area.

GR D-8.8 Provide parking areas for horses, with amenities such as hitching posts to tether horses and water troughs, within very rural Rural Neighborhood Centers (RNCs).
GOAL GR D-9  Improve the quality of development in the plan area by increasing pedestrian amenities.

GR D-9.1  Pedestrian amenities include items such as benches or other seating areas, fountains, plazas, trash receptacles, small-scale lighting, artwork, etc.

GR D-9.2  Pedestrian-oriented amenities should be located in and around commercial areas and community facilities.

GR D-9.3  Provide covered entryways, walkways, roofs, or porch designs on storefronts and civic buildings to protect pedestrians from the rain.

GR D-9.4  Require landscaping to be installed as a component of commercial, civic, and industrial developments.

GR D-9.4.1  Establish standards for the quantity and quality of landscaping around structures and within the parking lot, emphasizing the use of native plants.

GR D-9.4.2  Ensure sufficient and appropriate landscaping is provided to create a rural feel within the center.

GR D-9.4.3  Provide incentives for retaining significant trees and mature vegetation in place of new landscaping.

GR D-9.5  Utilize native plants within the landscape design.

GR D-9.6  Design buildings on sites that have sloping topography to follow the natural terrain to minimize earth disturbance and integrate the building into the site.

SIGN

GOAL GR D-10  Create sign standards that reduce the unnecessary visual clutter of signage within the community while promoting signage which successfully conveys information, advertises businesses, and reflects a positive image and rural character.

GR D-10.1  Design and locate signage to reflect the rural and historic character of the plan area.

GR D-10.1.1  Encourage the use of wall signs.

GR D-10.1.2  Limit the number and size of signs affixed to buildings.

GR D-10.1.3  Limit the number, size, and height of pole and monument signs.

GR D-10.1.4  Prohibit billboards within the plan area.

GR D-10.1.5  Limit the quantity of temporary and vendor signs.

GR D-10.1.6  Avoid creating a continuous strip of commercial signs.

GR D-10.1.7  Create sign standards that are appropriate to the community’s rural character.

GR D-10.1.8  Encourage the use of murals on the sides of commercial buildings that depict the rural or historic character of the plan area.
Limit the total amount of signage on each site (e.g., number of pole signs, monument signs, etc.).

Prohibit sign placement in public rights-of-way and on public utility poles.

Require consolidation of signage within commercial development to reduce visual clutter along streets and highways.

Eliminate the use of off-premise signs.

Design signs with details that reflect a rural character.

Encourage the use of natural rock and other natural materials in monument signs, emphasizing craftsmanship, materials detailing, and an organic quality.

Encourage neutral colors that are appropriate to the existing context and character of the plan area.

Signs should have a rustic feel appropriate to the community’s rural character.

Prohibit the use of flashing, blinking, spinning, or rotating signs or objects; video signs; roof signs; railing signs; reader board signs; inflatable signs; and signs attached to private light standards.

Prohibit signs that result in glare onto adjacent public streets or properties.

Avoid large entryway and monument signs into residential subdivisions; instead, design these signs to blend with the rural and natural landscape.

Maintain signs to be visually attractive and in good working order.

Signs should be kept in good repair.

Sign should be straight, clean, and without rust.

Faded signs should be replaced.

Construct signage that accurately and adequately conveys information.

Construct signage at the entry points of the various communities within the plan area, including Elk Plain, Thrift, Whiskey Hollar, Kapowsin, Bethel Stop, Kirby, Rocky Ridge, and others to provide a sense of entry into the given community.

Improve the amount and quality of informational signage and implement directional signage at appropriate locations.

Improve animal warning signs where appropriate.

Signs should contain current information.

Signs should match the business.

Enforce sign standards and encourage nonconforming signs to slowly come into compliance with new sign standards.
Encourage stricter enforcement of sign violations and abatement actions for dilapidated, abandoned, and illegal signs.

Ensure that temporary signs are removed promptly after the event or activity being advertised.

Promote the gradual reduction in the number of signs through the adoption of a sunset period for nonconforming signs.

Provide incentives to bring existing signs into conformance with new sign regulations.

**FISH/WILDLIFE HABITAT AND DEVELOPMENT**

**GOAL GR D-11** Identify and retain key open space corridors to maintain connectivity and enhance wildlife movement.

**GR D-11.1** Cluster development to provide open space that is configured to protect wildlife habitat and promote wildlife movement for the broadest variety of species.

**GR D-11.2** Roadways should be designed and constructed in a manner that allows for movement of wildlife.

**GR D-11.3** Where wildlife poses a threat to major thoroughfares, consider implementing a motion detection system to increase human and animal safety.

**GR D-11.4** Roads, bridges, and culverts should be designed not to block or impede fish passage or to limit a stream’s natural habitat or woody debris-forming processes (e.g., gravel or debris).

**VIEWSHEDS AND AESTHETICS**

**GOAL GR D-12** Protect the visual qualities and resources of the plan area as vital components which comprise the area’s special character and identity.

**GR D-12.1** Protect views of Mount Rainier.

**GR D-12.2** Preserve and protect existing views of mountain ranges and other scenic vistas as an integral part of the plan area’s character.

**GR D-12.3** Minimize tree removal to accommodate view creation; instead, encourage selective tree-limming as necessary.

**GR D-12.4** Work with public and private landowners to limit the visual impact of development on territorial views.

**GR D-12.5** Remove illegally operating junkyards.

**GR D-12.6** Require junkyards to be screened from the roadway.

**GR D-12.7** Clean up all trash and debris along roadways, including junk vehicles.

**GR D-12.8** Prioritize nuisance abatement at key entry points and corridors.
Establish measures to decrease glare from light sources that obscure the visibility of stars at night.

Restrict or shield lighting so as to restrict horizontal and vertical light trespass, thereby preserving the dark rural night sky.

Establish standards to ensure that fences maintain a rural character and protect the functions of the natural environment.

Construct fences of historical materials that are unobtrusive, and use locally available materials when possible.

Avoid fence types that have no historical precedent or are made from materials such as chain link, plastic, or vinyl.

Construct fences that are wildlife friendly.

Limit privacy fencing to areas immediately adjacent to a home.

Preserve and protect significant foreground views along viewing platforms or passageways such as public gathering spaces and major roadways.

Recognize SR 7, the Mountain Highway, as a scenic and recreational highway and pursue a similar designation for SR 161.

Regulate uses and signage along designated scenic and recreational highways to control negative visual impacts along these scenic corridors.

Open Space and Greenbelts

Conserve and protect open space areas through the application of design standards.

Apply environmentally sensitive design standards and techniques within open space corridors and the Rural Sensitive Resource (RSR) zoning designation, and consider uses that reduce impacts in the RSR zone.

Development within open space corridors and the RSR zoning designation shall utilize low impact development standards that address best management practices such as site development (clearing, grading, and tree removal), maximum impervious surface coverage, and minimum vegetation retention.

Any allowed non-residential uses, except school districts that utilize sustainable development methods, shall be required to use low impact development techniques.

At a minimum, low impact developments shall conform to the low impact development requirements outlined in the Pierce County Stormwater Management and Site Development Manual.
Low impact development tools that should be considered include minimizing soil disturbance and erosion, disconnecting constructed drainage courses, utilizing micro-detention facilities on each lot where feasible rather than one facility at the end of a conveyance system, and reducing/sharing parking facilities or using permeable pavement/pavers.

Vegetation and tree preservation shall be a priority on each site that is developed in the RSR designation.

Compatibility between the proposed use and designated open space tracts, as well as between adjacent uses, shall be maintained through techniques such as increased setbacks and screening utilizing native plant species.

All critical areas shall be set aside as a separate open space tract.

Consider clustering of lots, dwelling units, or building structures during the conceptual site development stage.

Integrate vehicle parking facilities into open space sites so that critical areas are not impacted and stormwater impacts are mitigated.

Design and place individual dwelling units and accessory dwelling units to avoid impacting the open space tract.

Limit and locate lawn areas, driveways, and roads to result in the least disruption to the open space tract.

Locate buildings and other structures such as fencing to protect the open space corridor. Individual structures shall not be placed where damage to the integrity of the open space tract and overall open space system is likely.

Preservation of native vegetation (Douglas fir trees, Pacific madrone trees, Oregon white oak trees, etc.) shall be a priority on each site that is developed in an open space corridor or within the RSR designation.

Require that any open space tracts (i.e., dedication area) be clearly marked and identified as a protected area through the use of fencing (when appropriate) and signage.

Utilize open space sites as part of a nonmotorized trail system.

Design and situation structures in designated open space areas so they are harmonious with their surroundings, constructed with natural materials, and well screened.

Utilize materials made of wood and stone or recycled products that look like these natural materials for benches, steps, railings, and fences.

Encourage developers to utilize green building techniques to soften the urban environment within the open space network.
GR D-15.5.1  Reduce impervious surfaces by providing a layer of plants on hard surfaces to create a new network of vegetation, linking roofs, walls, courtyards, streets, and open spaces.

GR D-15.5.2  Design buildings to complement the open space network.

GR D-15.5.3  Utilize courtyards to provide green spaces for work or relaxation, to be cultivated as wildlife habitats, or organized as attractive green areas to offer pleasing views from the home or office window.

GR D-15.5.4  Design the outside space in conjunction with design of the building structure to integrate vegetation into the design of the building.

GR D-15.5.5  Promote the use of balconies and small terraces in multifamily developments.

GR D-15.5.6  Encourage the use of vegetated rooftops in greenbelt areas or in designated open space areas.

GR D-15.6  Integrate public stormwater detention/retention facilities into the open space network to mimic the natural environment.

GR D-15.7  Maintain compatibility between the proposed use and designated open space tracts, as well as between adjacent uses, through techniques such as increased setbacks and screening utilizing native plant species.

GREENBELTS

GOAL GR D-16  Promote privately-owned greenbelts and passive recreational areas to supplement the public open space system within the community.

GR D-16.1  Establish standards for the private dedication of greenbelts and passive recreational areas within new development.

GR D-16.2  The amount of dedicated greenbelts and passive recreational areas should be proportional to the scale and impact of a development proposal.

GR D-16.3  Determine dedication requirements based on the Pierce County Parks and Recreation Plan and other available documents, including published state and national guidelines and standards.

GR D-16.4  Utilize greenbelts as buffers between uses and as visual relief from the built environment.

GR D-16.5  Utilize greenbelts and passive recreational areas for pathways, and integrate this system into the nonmotorized transportation network.

GR D-16.6  Greenbelt and passive recreational areas should integrate or bridge critical areas, such as wetlands, fish and wildlife habitat areas, or designated open space areas when possible.
IMPLEMENTING ACTIONS

The following list of actions needs to be completed in order to implement the policies contained within this plan. They are arranged according to the timeframe within which each should be completed: short, medium, or long term. Short-term actions should occur within one year of plan adoption. Mid-term actions should be completed within 2-5 years. Long-term actions should be completed within 5-10 years of plan adoption. The entity or entities responsible for leading the effort to complete the action item is listed in parenthesis following the action. Actions are assigned to the Land Use Advisory Commission (LUAC), Pierce County Planning and Land Services (PALS), Pierce County Economic Development (ED), Pierce County Parks and Recreation (Parks), Pierce County Public Works & Utilities (PWU), and Tacoma-Pierce County Health Department (TPCHD).

SHORT TERM ACTIONS (UPON PLAN ADOPTION TO 1 YEAR)

1. Amend Title 18J, Design Standards and Guidelines to:
   - Establish site design standards and guidelines and a site plan review and approval process for all proposed commercial, civic and industrial development.
   - Establish architectural standards and guidelines and an architectural plan review and approval process for all proposed commercial, civic and industrial development.
   - Encourage the use of low impact development techniques as outlined in Chapter 10, Pierce County Stormwater Management Manual.
   - Establish maximum impervious surface standards and minimum native vegetation retention requirements.
   - Prohibit clearing, grading, and vegetation removal, except for construction of roads and utilities, until building permits are issued.
   - Establish tree retention and reforestation requirements.
   - Provide for pedestrian amenities in proposed commercial, civic, industrial and residential development.
   - Establish design standards and guidelines for single-family and multifamily residential development to address site planning and building placement.
   - Establish architectural design standards and guidelines for single-family development in urban areas and multifamily residential development.
   - Establish design standards and guidelines for fencing. (PALS)

2. Amend Title 18B, Signs to establish sign standards and a sign review and approval process including:
   - Type and placement of signs.
   - Design details.
   - Sign maintenance.
   - Conveyance of information.
   - Nonconforming signs. (PALS)
3. Adopt an inventory of cultural and historic resources within the plan area that are significant for preservation, protection, or restoration efforts. These resources may include buildings, roads, sites, or districts within communities. (PALS)

4. Review Pierce County land use applications to determine if historic and cultural resources are listed for consideration. Amend as necessary to include this as a review item. (PALS)

**Mid-Term Actions (1-5 Years)**

1. Establish a Historic Preservation society for the communities within the plan area. The preservation society may:
   - Initiate special events to promote the history within the plan area.
   - Conduct fundraising activities to raise monies to preserve historic or cultural resources.
   - Engage in restoration actions for historic or cultural resources.
   - Work with individual property owners of historic or cultural resources to encourage preservation or restoration actions.
   - Establish signage for historic or cultural resources. (PALS, LUAC)

2. Work with Pierce Transit to increase transit service within the plan area. (PWU, LUAC)

3. Amend Title 18A, Zoning cottage industry standards to:
   - Create separate categories and requirements for urban and rural levels of development.
   - Provide adequate screening between cottage industries and residential dwellings.
   - Establish buffer requirements between proposed developments and adjacent streets.
   - Require a conditional use permit for the construction of new private wireless communication facilities. (PALS)

4. Amend Title 18J, Design Standards and Guidelines to:
   - Establish viewshed guidelines.
   - Develop design standards and guidelines for wireless communication facilities. (PALS)

5. Develop a preferred master conceptual plan for development of RACs and RNCs throughout the plan area. (PALS)

**Long Term Actions (5-10 Years)**

1. The Graham Advisory Commission should work with the Pierce County Responds Program to clean up all trash, junk, and debris within the plan area. (PALS)
Historic Resources

1. Elk Plain School
2. House
3. Jackson House
4. Wayzata Lake School
5. Rocky Ridge School
6. Log House
7. J. Robertson House

Graham Community Plan
Chapter 4: Natural Environment Element

**INTRODUCTION**

This is a time of extraordinary environmental change. All around the region, country and world, natural landscapes continue to be reduced and fragmented. Essential relationships within ecosystems are different than they were even just a century ago. At a local level, the recent listing of Chinook salmon as a threatened species under the Federal Endangered Species Act is indicative of this plight.

The types and intensity of human population, activities, development and resource use alter natural systems. Fortunately, many people are working towards shifting paradigms and priorities to make some effective changes in the human interaction with the natural environment. The Natural Environment Element addresses desired changes to protect and conserve natural environment resources such as air, soils, vegetation, water, and fish and wildlife species found within the community plan area.

**DESCRIPTION OF CURRENT CONDITIONS**

During the last several decades, the greater Graham area of Pierce County has experienced urban levels of growth, primarily in the northern portion of the plan area. Rural resource industries such as agriculture, forestry, and mineral extraction have also been conducted within the plan area. Both types of human activities have impacted natural systems. Some of the plan area still retains a rural residential or undeveloped character and, as a result, has incurred fewer negative impacts to the natural environment than the more urban portions of the County.

Knowledge about the condition of each component of the natural environment is important to understanding the functioning of the whole ecosystem. Therefore, each particular resource (air, earth, water, fish and wildlife) warrants a more detailed discussion. Open space is also discussed here as it relates to the natural environment.

**AIR RESOURCES**

The region's air quality is highly influenced by the Pacific Ocean, westerly wind patterns, and two mountain ranges. The typical airflow within the region is westerly winds coming from the Pacific Ocean. Most of the time, this airflow provides wind-driven mixing, which effectively disperses air pollutants. However, air inversions can occur resulting in stagnation and increased pollution levels. This condition is exacerbated by the Olympic Mountains to the west and the...
Cascade Mountain range to the east, that form the sides of a bowl, which helps trap air pollution within the urban basin. During times of air inversions, air pollution will continue to accumulate until the weather pattern changes.

Most of the air pollution within the Puget Sound region comes from urban development, emissions from motor vehicles, wood burning and industrial activities. The Puget Sound Clean Air Agency (PSCAA), in cooperation with the Washington State Department of Ecology (DOE), monitors air quality in a four-county region (Snohomish, King, Pierce, and Kitsap) for compliance with federally established standards. Air quality within the Puget Sound region is currently classified as meeting federal standards. The PSCAA’s Air Quality Index, generally rates air quality between good to moderate.

The Graham Community Plan area is part of the Puget Sound airshed. Air quality within the plan area is generally consistent with that of the greater Puget Sound region. However, the plan area does experience some localized air quality problems. Gravel roads, development sites, and some recreational activities cause dust emissions. Some natural resource industries such as dairy farms and natural resource based industries like plywood mills can emit unpleasant odors. Illegal burning in barrels or slash burns and use of uncertified fireplaces and wood stoves may increase particulate matter. There are also concerns about the impact to air quality from idling freight trains, the 304th Street landfill, and businesses in the Frederickson Employment Center.

**Earth Resources**

**Soils**

Soil types determine the ability of the ground to absorb rainfall and dictate appropriate levels and types of development. Pierce County Surface Water Management classifies soil types into hydrologic soil groups A through D. Classifications range from low runoff potential with high infiltration capacity (group A) to high runoff potential with low infiltration capacity (group D). Group A and B soils typically include sandy loam soil types such as Spanaway gravelly sandy loam, while Kapowsin gravelly loam is an example of a group D soil. These soil groups become indicators of which areas are more susceptible to surface water runoff, flooding, and groundwater recharge problems. For example, soils with high infiltration capacity can result in insufficient filtration of runoff pollutants. This may correlate to inadequate protection of groundwater quality. The poor draining soil types contribute to septic failure and quick surface runoff that creates flooding, even during smaller storm events.

The soils found within the plan area range from the extremes of well draining to poorly draining soil groups. The northwest corner of the plan area contains soils that generally are well drained. This soil group tends to become dry and droughty during the summer and early fall. The primary historic land cover types are prairies and savannahs, though this soil can also support woodlands. The rest of the plan area mostly contains soils that generally are poorly drained and typically support conifer forests and wetlands. (See Map F-22: Soils and Map F-23: Hydrologic Soil Groups)
**LANDSLIDE AND EROSION HAZARD AREAS**

Landslide areas are those lands subject to risk of mass movement. Erosion hazard areas may be vulnerable to retreat, sloughing or calving, or movement of sediments. This type of land movement is caused by a combination of geologic, topographic, and hydrologic factors such as soil composition and texture, vegetation cover, and rainfall patterns. Landslide and erosion hazard areas may potentially cause damage to structures and in extreme cases, loss of life during a severe event. About 15% of the plan area contains a designated landslide hazard or erosion hazard area. These areas are primarily located in the Rocky Ridge area and the Orting Valley Ridge. (See Map F-24: Potential Landslide Hazard Areas and Map F-25: Potential Erosion Hazard Areas)

**SEISMIC HAZARD AREAS**

Seismic hazard areas are prone to earthquake-induced landsliding, groundshaking, dynamic settlements or soil liquefaction. Structures within these areas are subject to severe risk of damage. Approximately 10% of the plan area contains soils that have the potential for liquefaction and/or dynamic settlement during a seismic (earthquake) event. These areas are primarily located in the Ohop and Orting valleys and along stream corridors such as Muck Creek and South Creek. (See Map F-26: Potential Seismic Hazard Areas)

**VOLCANIC HAZARD AREAS**

Volcanic hazard areas are subject to inundation by pyroclastic flows, mud and debris flows (lahars), or related flooding caused by a geologic or volcanic event on Mount Rainier. Potential hazard zones are typically located close to the mountain or within major riverine areas. The eastern portion of the plan area, in the Puyallup River Valley, lies within a designated volcanic hazard area. (See Map F-27: Volcanic Hazard Areas)

**Vegetation**

The historic plant communities within the majority of the plan area were mixed woodlands (hardwoods and conifers ranging from early to late seral stage), with the exception of the northwest portion of the plan area which contained prairies, savannahs, and oak woodlands. Prior to European settlement of this area, the local Native Americans induced periodic fires that prevented the prairies and savannahs from developing into a dense forest cover. At this time, the plan area contains a mixture of pasture grasses, agricultural crops, native grasslands and prairies, wetlands, and a mixture of lowland conifer forests and hardwood/shrubs.

The Washington Department of Natural Resources provides information on tree coverage and categorizes this information based upon the seral stage of the tree stands (late, mid, or early) or non-forested areas (urban, agricultural, rangeland, barren, glaciers). Late seral indicates old growth forests while early seral would signify early growth reforestation areas. The majority of tree stands within the plan area are a mixture of conifer and hardwood forests classified as early seral stage. A small amount of tree canopy cover is designated as late seral stage. A large portion of the plan area is designated as non-forested, reflective of urban and agricultural development patterns. (See Map F-28: 1991 Classified Canopy Cover)
In 1999, the Washington Department of Natural Resources (WDNR), in conjunction with the U.S. Fish and Wildlife Service and Tahoma Audubon, completed a survey of oak stands in Pierce County greater than one acre is size. This survey did not indicate any oak stands meeting the above criterion within the plan area; however, oaks stands and trees do exist in the plan area as identified in the prairie inventory described below and by area residents. Other significant tree species within the plan area worth noting are the Pacific Yew, Pacific Madrone, and the Ponderosa Pine. These species tend to be slow-growing and susceptible to impacts from adjacent development.

In the summer of 2003, Pierce County commissioned a survey to identify the location of potential prairies within the plan area. These areas were identified using information on soils that support prairie plant species (Everett gravelly sandy loam and Spanaway gravelly sandy loam series) and field verification of native prairie indicator plant and tree species such as camas, kinnikinnik, field chickweed, Idaho fescue, wooly sunflower, blue-leaf fescue, two-color lupine, Western buttercups and Oregon White Oak trees. Prairie areas are generally located in the northwestern and western portions of the plan area. (See Map F-29: Prairie Inventory/Soils)

Wetland vegetation is scattered throughout the plan area and is discussed in greater detail under the Water Resources section below.

**Water Resources**

**Water Resource Inventory Areas (WRIAs) and Watershed Basins**

Water Resource Inventory Areas (WRIAs) are watershed planning units established by Washington State. Pierce County has further divided these WRIAs into 26 watershed basins. The plan area contains three WRIAs and five watershed basins. The Nisqually WRIA (Mid-Nisqually River, Muck Creek, and Ohop Creek watershed basins) is located in the central and southern portion of the plan area. The largest basin, Muck Creek, encompasses approximately 53% of the plan area. The Tacoma WRIA (Clover Creek/ Steilacoom watershed basin) is located in the northwest portion of the plan area. The Puyallup WRIA (Upper Puyallup River and Mid-Puyallup River basins) runs the length of the eastern portion of the plan area. (See Table F-15 and Map F-30: Watersheds)

Pierce County Water Programs Division has completed plans for the Clover Creek and Muck Creek basins. A plan for the Mid Puyallup River Basin is under development. Basin plans analyze the existing hydrologic and habitat systems and address the impacts of current and proposed land use development on surface water runoff, capital improvement projects, and habitat degradation. Both the Muck Creek and the Clover Creek Basin Plans discuss the basin boundary between the two basins. Because the basin boundaries are delineated by surface topography they do not necessarily represent the total amount of water that may be entering a basin due to groundwater. The groundwater contributing areas are much more difficult to delineate but both plans recommend some additional study to attempt to map the contributing areas and determine which basin the infiltrated water goes into.

### Surface Water Runoff and Flooding

#### Flood Hazard Areas

Pierce County regulates FEMA floodways, A zones (100-year floodplain) and B zones (500-year floodplain) as flood hazard areas. In addition to the FEMA designated floodways and floodplains, some pothole areas and areas of fast moving water (deep and/or fast flowing water) are also regulated as flood hazard areas. These areas are typically associated with rivers and streams, lands adjacent to marine waters, and depressional areas. Map F-31: Potential Flood Hazard Areas depicts where these flood hazards are located within the plan area.

#### Surface Water Flooding

As forested and natural vegetative cover is replaced with development, surface water runoff (stormwater) tends to increase both in volume and rate of runoff. Historically, rainfall would be utilized in forest evapotranspiration processes or stay on a site trapped in numerous small depressions, saturating the top several feet of soil. Flooding would only occur during larger storm events when the vegetation and soil was completely saturated. As development has occurred, vegetation has been removed and many of the small depressions were graded smooth, with the top several feet of soil removed or compacted. This type of development
removed the ability of the land to contain the smaller storm events and subsequently flooding started to become a problem at even the smaller events, particularly in areas underlain by Type C or D soils. Increases in the number and capacity of connected drainage systems, in the form of ditches and pipes intended to drain properties and remove water quickly, also increase stormwater problems downstream.

Stormwater, that has not been properly addressed, can also result in water quality and habitat degradation, negative impacts to fisheries, and erosion. Stormwater related problems can be correlated to the amount of impervious surface within a watershed or basin. Recently published research indicates that water quality problems and habitat degradation start occurring when a watershed reaches approximately 10% effective impervious surface. This percentage can be reached with a density of as little as one home per acre because of the network of roads needed to support this type of development.

**Flooding Problems in the Plan Area**

Most flooding within the Muck Creek Basin is localized and many of the flooding complaints received by the County occurred during the major storm events of 1996 and 1997. There is some regional flooding near 224th St. E. and Meridian. Stormwater in that area ends up on a vacant lot behind the shopping center and during large storm events the water has flowed south to an adjoining mobile home park. Some of the stormwater from the site flows west, and infiltrates into the ground. It is thought to emerge to the north, in the Clover Creek Basin. A regional infiltration pond has been proposed as a potential solution, subject to the results of additional studies. It appears that the majority of the flooding issues within the plan area are the result of undersized culverts. The Muck Creek Basin Plan proposes eight culvert improvements within the plan area, and improvements to one road. A small infiltration pond has been suggested to address localized flooding at 242nd St. E., near 49th Ave. E. At the southeast corner of the plan area, several homes experience flooding from runoff at Mountain Highway, near 340th St. E. A flow splitter has been proposed there to redirect stormwater.

Several minor areas of flooding have been reported in the Horsehaven Creek sub-basin of the Mid-Puyallup basin. Several private culverts conveying Horsehaven Creek under driveways do not appear to be large enough to convey estimated future flows and backwater pooling of the creek onto these properties and around the Orting-Kapowsin Highway culvert may occur if storm flows are not retained during major storm events. The Mid-Puyallup River Basin planning process is looking into alternatives to ameliorate future flooding and the erosive effects of urban stormwater flows in these areas.

Flooding problems identified in the Clover Creek Basin Plan typically occur at the transition point where ephemeral channels drain onto the lower outwash soils where typically the runoff quickly infiltrates. When these transition areas are encroached upon by development there can be inadequate area left to infiltrate the runoff coming from the ephemeral channel. This problem occurs at 224th St. E. and 46th Ave. E. where new residential development has occurred at a transition area. Another potential problem area is just west of 224th St. E. and Meridian Ave. where a transition area is zoned as Rural Activity Center. Significant flooding also occurs along a low crescent-shaped channel known as the Kirby Channel near Eustis Hunt Road.
This flooding is associated with the local groundwater level, which can rise and fall based on cumulative annual rainfall.

**GROUNDWATER**

The groundwater aquifers within Pierce County supply drinking water for over 270,000 residents and, for more than 170,000 of these residents, the aquifers serve as the sole source of drinking water. The entire plan area is underlain by a sole source aquifer. The Clover/Chambers Creek Aquifer system is located in the northwest portion of the plan area and this area also contains some areas identified as DRASTIC zones. Approximately 10% of the plan area is designated as a Wellhead Protection Area. The depth of groundwater in the plan area ranges from one to more than 100 feet. (See Map F-32: Aquifer Recharge Areas). See the Facilities and Services Element for a more detailed discussion on drinking water supplies.

**WATER QUALITY**

Water quality measurements include sediment, temperature, oxygen levels, bacteria, minerals, and chemicals. Threats to water quality come from a variety of everyday sources such as agriculture (livestock in and near streams), forest practices, failing septic systems, stormwater, construction activities, recreation (boats and marinas), road runoff, and residential, commercial and industrial activities. These sources are often referred to as “nonpoint” sources of pollution. Point sources of pollution include businesses and sewage treatment plants, which directly discharge into salt or freshwater. Given the rural character of the plan area, it is probable that the majority of water quality problems are attributable to nonpoint sources of pollution.

The primary data used to assess groundwater quality is provided by U.S. Geological Survey, Washington Department of Health (WDOH), Tacoma-Pierce County Health Department (TPCHD), and water purveyor sampling information. In terms of meeting drinking water standards, the groundwater quality within the Muck Creek Basin appears to be good. All local well samples, except one (351st Street Well Association) fell below the state standards. Groundwater within the Chambers/Clover Creek basin varies substantially, depending on soil permeability and aquifer depth. The northwest portion of the plan area, particularly along SR 7, is susceptible to groundwater contamination due to permeable surface material and lack of confining hydrogeologic units that protect deep aquifers. Water quality data demonstrate higher nitrate and chloride levels in this area. For example, a cluster of wells in the Spanaway area tested high in nitrate, which is probably the result of septic systems that rapidly drain effluent in the shallow aquifer system.

Within the Muck Creek Basin dissolved oxygen, summer stream temperatures, and fecal coliform levels seem to be problems and testing results in upper Muck Creek often fail to meet state standards for these measurements. The dissolved oxygen levels are low but not low enough to typically cause mortality to fish. However, the temperature has been recorded within the lethal range for fish and is most likely caused by lack of riparian shade. The high fecal coliform levels are related to surrounding agricultural uses.
SHORELINES

The Pierce County Shoreline Management Program (SMP) was adopted in two phases; in 1974 and 1975. Since then a limited number of amendments to the SMP have been adopted. Over the last three decades conditions in shoreline areas have changed considerably as the community has grown. Scientific understanding of natural systems and processes has also evolved. It is now time to conduct a comprehensive review and update to the SMP to reflect current conditions, scientific information regarding shoreline habitats and processes, and public attitudes toward managing shoreline resources.

The Washington State Shoreline Management Act (SMA) provides for the management of water bodies or watercourses identified as “Shorelines of the State.” Areas under jurisdiction of the SMA include the water body/course, all lands within 200 feet of the ordinary high water mark, and associated wetlands and floodplains. In the plan area this classification is applied to Lake Kapowsin, Tanwax Lake, Whitman Lake, Morgan Lake, Ohop Creek, Kapowsin Creek, and the Puyallup River and a portion of South Creek.

Shorelines of the state are designated into five types of environments including Urban, Residential Rural, Rural, Conservancy, and Natural. These environments are similar to zoning designations allowing different land uses, densities and activities ranging from the most intensive uses (Urban) to very limited uses (Natural). The Residential Rural designation is the most intensive allowed within the plan area (single family and some commercial) and is applied to Whitman Lake and the majority of Tanwax Lake. South Creek, Morgan Lake, a portion of Kapowsin Creek and a portion of the Puyallup River are designated as Rural, which allows low density residential and intensive recreational and agricultural uses. The Conservancy designation, allowing outdoor recreation and low intensity agricultural and forestry uses, encompasses all of Lake Kapowsin and Ohop Creek and a portion of Kapowsin Creek and the Puyallup River. Only a small portion of Kapowsin Creek is designated as Natural. The Natural Environment establishes very limited uses that typically require approval of a conditional use permit. (See Map F-33: Shoreline Environments)

WETLANDS

Wetlands are legally protected under the Federal Clean Water Act, the State Growth Management Act, and Pierce County Codes. Wetlands are identified by the presence of water during the growing season, hydric soils, and the presence of a plant community that is able to tolerate prolonged soil saturation. These special land areas provide many important environmental functions including: reducing the impact or frequency of flooding, providing habitat, recharging aquifers, providing clean water for fish and other aquatic species, and preventing shoreline erosion. Wetlands also provide visual buffers in the built landscape.
The plan area currently contains both isolated wetlands and wetlands which are adjacent to creeks and the lakes. In addition, there is a strong correlation between designated flood hazard areas and wetlands. Many of the scattered wetlands in the plan area are elongated troughs that are the result of underlying Dupont Muck soils, which formed when the glaciers receded. Some of these wetlands are bogs that formed as pre-historic lakes, which have filled in over time. (See Map F-34: County Wetland Inventory)

**FISH AND WILDLIFE RESOURCES**

Pierce County regulates critical fish and wildlife species and their associated habitats. Critical fish and wildlife species are either federally or state-listed as endangered, threatened, sensitive, candidate, or monitored. Associated habitats may be identified by either point locations (such as a nest or den) or by broader habitats that support some stage of the species life-cycle (such as oak woodlands or river systems). All anadromous fish species are considered critical because of the recent listing of the Chinook salmon and bull trout under the Federal Endangered Species Act (ESA) and the importance of these species to the various indigenous Native American Tribes throughout the region.

**FISH SPECIES AND HABITAT AREAS**

**ANADROMOUS FISH AND HABITAT**

Eight anadromous fish species are identified on the revised Washington State Department of Fish and Wildlife (WDFW) StreamNet Maps as known and/or predicted to occur within the plan area. (See Map F-35: Fish and Wildlife Resources). The location, status, origin and type, spawning, and ESA listing information for each anadromous fish species within the plan area is depicted in Table F-16.

* Information from the 2002 draft Washington State Salmon & Steelhead Stock Inventory (SaSI), WDFW and from interviews with WDFW staff.

** Chinook Salmon and Bull Trout/Dolly Varden are listed as Threatened under the Endangered Species Act.

*** Bull Trout/Dolly Varden (WDFW has not done enough genetic analysis to determine if the basins contain one species of native char or both, and they’re difficult to distinguish, except by genetic analysis). Both have anadromous life history forms. Cutthroats were rated in 2000, and Bull Trout/Dolly Varden in 1998.
The status of the fish species within the plan area, where known, ranges from healthy to depressed. Both steelhead and pink salmon are depressed in each system and two anadromous fish species, Chinook salmon and bull trout/Dolly Varden, are listed as threatened under the Endangered Species Act. Most of these species are wild, natives, with the exception of Coho and Chinook, which are of mixed hatchery origin.

Conditions that affect fish habitat quality along Muck Creek include fish passage barriers, invasive reed canary grass, sedimentation, lack of large woody debris (LWD), and low stream flows. Muck Creek and its seven major tributaries have barriers to upstream fish migration within one mile of the mouth. Sedimentation of the channel bed is most apparent downstream of cattle and horse ranches, where livestock is allowed unrestricted access into the creek. The creek is generally devoid of LWD, which is apparently being removed from stream channels by local residents. As a result, channel complexity is generally poor and pool abundance and quality is low. Reed canary grass also thrives where riparian areas lack proper shading from a well vegetated riparian corridor. The relatively late timing of the Coho and chum runs in the Muck Creek system suggests that the fish that utilize the creek for spawning have been influenced by the intermittent stream flow condition and have timed their runs to coincide with higher water levels that allow passage through the reach above Roy. While Coho may be able to hold in the Nisqually River until stream flows increase this does not favor late arriving fish. Coho have not been seen in Muck Creek for several years which impairs further analysis.

**NON-ANADROMOUS FISH AND HABITAT**

The Washington Department of Fish and Wildlife Priority Habitats & Species (PHS) dataset identifies 11 non-anadromous fish species within the plan area. Table F-17 provides a detailed list of these species and the state and federal status.

**Table F-17: Non-Anadromous Fish Species**

</table>
The majority of critical wildlife species within the plan area are either state-listed or federally-listed. The Oregon spotted frog, Western pond turtle, and fisher are listed as endangered and the Western gray squirrel and bald eagle are listed as threatened by Washington State. Both the Oregon spotted frog and bald eagle also contain the same federal listing status. Some biologists think that the Western pond turtle and fishers, which are extremely rare, may actually be extirpated in this region. The PHS habitats identified within the plan area include wetlands, urban natural open space, riparian, and waterfowl-rich areas.

In 2002, Pierce County, in conjunction with WDFW and the University of Washington, completed a wildlife biodiversity plan for Pierce County. This plan identifies areas within Pierce County that provide for the greatest diversity of wildlife species, based on existing land cover (vegetation zones) and the concepts of species richness and representation. The areas with the highest diversity and representation were designated as Biodiversity Management Areas (BMAs). Connecting corridors between the BMAs have also been established to facilitate wildlife movement between BMAs. Collectively this system of BMAs and connecting corridors is referred to as the biodiversity network. In 2004, the County completed an assessment of this network and the one identified BMA within the plan area was removed because the habitat had been converted to agricultural fields. However, the plan area still contains biodiversity network connecting corridors along Lake Kapowsin and Kapowsin Creek (see Map F-36: Biodiversity Network).
There are three major open space corridors located within the plan area including Muck Creek from SR 7 to the headwaters of Muck Creek, the entire South Creek system, and a north/south system encompassing the Puyallup River, Kapowsin Creek, Lake Kapowsin, and Ohop Creek. A smaller open space corridor includes Tanwax Creek and Lake. (See Map F-8: Open Space Corridors)

**Overview of Current Open Space Plans, Policies and Regulations**

**Pierce County County-Wide Planning Policies**

All jurisdictions within Pierce County participate in the development of the Countywide Planning Policies (CWPPs.). Each jurisdiction’s comprehensive plan needs to be consistent with the policies established in the CWPPs. The Pierce County CWPPs require all jurisdictions to plan for the provision of open space; consider as open space parks, environmentally sensitive lands and greenbelts, natural buffers, scenic and natural amenities unique geological features; designate appropriate open space; and encourage new housing to locate in a compatible fashion with open space designations or outside designated open space.

**Pierce County Comprehensive Plan Policies**

The Pierce County Comprehensive Plan contains several policies that address open space. These policies establish some general criteria for areas that should be considered for open space. These criteria include areas where natural processes (e.g., wetlands and tidal actions) occur or sites that contain unusual landscape features (e.g., cliffs and bluffs), wooded areas, environmentally unique areas, and parcels which provide connectivity in the open space network.

The open space/greenbelt areas within the County are depicted in the map referenced in policy 19A.30.170 I. Section 19A.30.130, Objective 57A, states County programs which provide for preservation of open space shall have established priorities and these priorities will be used to rate open space proposals for Conservation Futures funding, Open Space Current Use Assessment taxation, Development Regulations bonus densities, and other County programs which acquire or preserve open space areas. Section 19A.30.130, Objective 59B, sets forth policies on the management and stewardship of County-owned open space lands. Finally, 19D.170 identifies the County’s open space priorities grouped under high, medium, and low priorities.

**Pierce County Development Regulations**

Title 18A, Development Regulations-Zoning, Section 18A.35.025 contains standards for minimum residential amenities which include provisions for on-site open space areas. These standards require the dedication of open space land per dwelling unit for subdivisions and mobile home parks. Section 18A.35.050 addresses open space issues such as density incentives, open space location and designation criteria, permitted uses, classification...
mechanisms, and public access. Permitted uses within designated open space areas include pervious and impervious surface trails, passive recreation and associated accessory structures, agricultural practices and associated structures, aquaculture, utility easements, and drainfields.

**Open Space Programs**

Different open space programs and development regulations lend themselves to protection and restoration of various designated open space areas. For example, when designated open space areas fall within the jurisdiction of the State’s Shoreline Management Act, the County’s Shoreline Management Use Regulations are in effect. Likewise, when an open space area is located within a designated critical area, which is often the case since the mapping was primarily based upon critical area data, the County’s Critical Area Regulations would apply. Outright purchase and other acquisition efforts, such as obtaining conservation easements, can be applied through the County’s Conservation Futures Program or local land trust efforts. Property owners may choose to leave portions of their properties in an undeveloped condition in return for a reduction in their property taxes under the Current Use Assessment (CUA) program. Pierce County Conservation District Stream Team efforts and those of other local environmental organizations work to enhance and restore degraded riparian areas. Finally, the County’s zoning regulations require a dedication of open space for certain types of development and certain zoning classifications may be established that require lower densities or intensity of use and the application of environmentally sensitive design standards.

**Current Use Assessment Program**

Since 1972, the County has offered a Current Use Assessment (CUA) program. This program provides property owners with a tax reduction incentive to maintain properties in productive agricultural land, timberland, or open space land condition. At the present time, there are approximately 413 properties enrolled under the open space category of the CUA program.

In the summer of 1999, the administrative procedures for the CUA program were revised and a public benefit rating system (PBRS) was adopted as a means of ranking applications for the CUA open space category. Properties are evaluated to determine what environmental features are present and points are given based upon open space priorities and bonus categories such as public access and property located within an urban area and within the designated open space corridor. The amount of tax reduction is based on a sliding scale of points with the most sensitive lands receiving the highest tax reductions.

**Conservation Futures Program**

The Parks Department also administers the Conservation Futures Program, which since 1991 has authorized the County to collect a real-estate property (6¼ cent per $1,000.00 of assessed valuation) tax for the acquisition of open space properties or conservation easements. To date the County has collected $26,900,000 and acquired 1,245 acres of valuable wildlife habitat and open space properties throughout the County. The properties are not only held by the County but also by the cities and land trusts within the County.
The County Parks Department, utilizing Conservation Futures Program monies, purchased the Muck Creek/Patterson Springs property for $785,000 from the Tacoma Public Utilities in 2002. This is an 80-acre wildlife habitat site generally located near 252nd St. E. and 86th Ave. E. and adjacent to the Morse Wildlife Preserve. This property was transferred over to the Cascade Land Conservancy for long-term stewardship.

**DESCRIPTION OF DESIRED CONDITIONS**

Most people recognize the need to protect the ecosystems that support fish, wildlife, and humankind. Each component of the natural environment was examined in detail and a variety of ideas and proposed actions were articulated as methods to retain and enhance each resource. The following text describes the desired condition for each resource type in more detail. The policies contained in the next section were developed to address these desired conditions, which reflect the comments and concerns of the local citizens.

**GENERAL**

Some strategies affect the natural environment on a Countywide basis such as public education and outreach efforts. The County, Washington State University Cooperative Extension Office, and other affected agencies should increase the level of public education and outreach methods. This could be accomplished through brochures, online resources, and informational material on human actions that can negatively impact the natural environment. Partnerships should be established with realty and escrow companies to notify potential buyers of environmental resources and stewardship opportunities.

**AIR RESOURCES**

Air quality within the plan area is generally good; however, residents do tend to experience some localized problems with emissions of particulate matter and unpleasant odors. Development regulations should be amended to reduce dust emissions, negative odors, and air pollutants along main transportation corridors. Air quality studies and monitoring should be conducted for industrial businesses located within the Frederickson Employment Center, the 304th Street landfill, and along freight rail lines to determine the potential air quality impacts on residents. More public education and enforcement should be targeted toward impacts from burning in uncertified fireplaces and woodstoves, conducting slash burns, and illegal burning in barrels. Incentives should be provided to change wood burning facilities to natural gas. Methods should be explored to reduce negative smells coming from dairy farms.

**EARTH RESOURCES**

**SOILS**

The community has a strong desire to maintain native soils and minimize negative impacts on natural systems from soil disturbance associated with development activities. Strategies such
as covering exposed soils, phasing clearing and grading activities to reduce the amount of
exposed soils, and utilizing low impact development techniques should be applied to reduce
erosion and sedimentation. Soils that support agricultural activities should be preserved.

Vegetation

Retaining native vegetation fosters a sense of a rural community as well as providing
environmental benefits. A system of greenbelts should be established throughout the
community that preserves native vegetation. New developments should be required to retain
areas with native vegetation. Where new development is allowed to remove existing
vegetation and replant, the new plants should be native and maintained to ensure that
revegetation efforts are successful. Invasive or exotic plant species such as Scots broom, tansy
ragwort, and reed canary grass should be removed throughout the plan area.

The prairies and the oak woodlands are one of the historic vegetation types found within the
plan area. The community places a high cultural value on their remaining prairies and oak trees
as well as recognizing that they provide an important habitat for several resident critical or at-
risk wildlife species. Preserving any remaining fragments of prairies and oak trees left within
the plan area is a high priority. An inventory of prairies and oaks within the plan area is crucial
to the development of critical area maps, which are used during the development review
process. Prairie and oak inventories should be integrated into the County’s critical area atlas
maps. Efforts should be made to educate the public on the cultural and biological importance
of prairie and oak savanna landscapes.

Water Resources

Surface Water Runoff and Flooding

Maintaining the natural hydrologic conditions and functions, both within the plan area and in
the adjacent watershed basins that receive stormwater runoff from the plan area, helps reduce
flooding problems. Areas that are currently experiencing flooding problems (e.g., 224th St. E.
and Meridian and 224th St. E. and Muck Creek) should be analyzed and identified to receive
high priority for correction. Stormwater management systems (culverts and ditches) in new
development should be appropriately sized so as to not cause additional flooding problems and
existing stormwater facilities that are undersized should be upgraded.

Groundwater Resources/Aquifer Recharge and Wellhead Protection Areas

Groundwater is the primary source of drinking water for the residents within the plan area.
Protecting and conserving groundwater supplies and maintaining subsurface flows that
replenish wetlands, streams and aquifers is very important. Some actions to foster
groundwater and subsurface recharge include limiting the amount of impervious surfaces,
utilizing low impact development techniques and prohibiting artificial channels and ponds that
can leach water away from natural environmental features. Surface water management
projects should also be constructed in such a manner as to prevent the diversion of surface
water from one watershed basin to another.
Aquifer recharge and wellhead protection areas deserve special considerations. Any land use activities within these areas should be regulated in such a manner so as to prevent contamination of groundwater resources. The level of public outreach efforts to educate citizens about practices to protect aquifer recharge and wellhead protection areas should be increased. Signage identifying the limits of aquifer recharge and wellhead protection areas should be posted to help the public understand the boundaries of these sensitive areas. Once the Clover Creek and Nisqually Watershed Planning processes are complete, any newly identified aquifer recharge areas should be incorporated into the County’s Critical Area Atlas - Aquifer Recharge and Wellhead Protection Area maps.

### WATER QUALITY

The quality of water resources affects drinking water supplies and habitats for fish and wildlife species dependent on wetlands and shoreline areas. Sources of nonpoint pollution should be eliminated or reduced to protect the water quality within the plan area. Agricultural practices can be modified to eliminate fecal coliform bacteria contamination into riparian areas, such as restricting livestock and livestock waste from entering into rivers, creeks, and wetlands. Forest practice activities such as logging road construction, debris stockpiling, and removal of trees conducted adjacent to streams, wetlands and their buffers that result in erosion and increased water temperatures should be avoided. On-site sewage system requirements and practices that could potentially allow fecal coliform bacteria contamination into surface water and groundwater should be evaluated and, as necessary, amended. More emphasis should be placed on public education and outreach efforts that are geared towards reducing the impacts to water quality associated with typical household activities. Examples of such activities include fertilizer/pesticide application, disposal of waste and toxic chemicals, vehicle maintenance, and maintenance of septic systems.

### SHORELINES

As land has developed in the plan area, surface water flow rates in streams may have changed. It is important that stream flow calculations be updated and that all streams that have flows sufficient to be classified as shorelines subject to the Shoreline Management Act (SMA) and SMP, are brought under jurisdiction of the SMP. In particular, Muck Creek should be evaluated to determine if any portion should be classified as a Shoreline of the State.

Shoreline Environment designations in the plan area should be reviewed and, if necessary, updated. Specifically several shoreline properties along Tanwax Lake and Lake Kapowsin appear to have shoreline designations that do not reflect current conditions. Further review of these shorelines should be conducted to determine if they should be given a new Environment designation.

Additional actions can be taken along shorelines to provide greater protection. Density bonus
provisions should be eliminated along shorelines, with a greater emphasis placed on creating additional public access points. And old, dilapidated structures, especially those with failing or non-existent septic systems, should be removed or brought into compliance with current code requirements.

**Wetlands**

Many of the wetlands historically contained within the plan area have been filled and/or significantly impacted by development and natural resource activities. Preserving the wetland areas that do remain within the community is a major concern. In addition, any future development activities should be conducted in such a manner as to maintain the quality and function of the existing wetland complexes. Where feasible and appropriate, wetland restoration activities should be undertaken to increase the healthy functioning of wetland systems (both natural and artificially created) which may have degraded as a result of human actions. Ditches that have artificially altered natural wetland systems should be disconnected and the original hydrologic regime restored.

**Fish and Wildlife Resources**

Fish and wildlife data sources and mapping are the primary mechanisms used in the development review process. Where data is insufficient, habitats may be inadvertently lost. Species and habitat mapping information within the plan area should be updated. The current Critical Area Atlas maps should include fish and wildlife species and habitats that have not been adequately mapped. Special emphasis should be given to mapping the prairies and Oregon white oak trees remaining within the plan area. In addition, the County should coordinate with WDFW to verify the presence of certain fish and wildlife species, such as Chinook salmon and steelhead, bald eagles, Western gray squirrels, heron rookeries, migratory bird populations, and elk, within the plan area. WDFW should also establish monitoring stations for Morse Preserve and within the biodiversity network.

Existing fish and wildlife species and the habitats that support the species historically found within the plan area should be protected and where feasible restored. Bird friendly design standards should be developed to decrease injuries to migratory bird populations. An analysis should be conducted to determine the cause of low or no base flows in streams within the plan area. Other measures to protect fish and wildlife species and habitats include streamlining the permit process for restoration projects, removal of barriers for fish access, and promoting increased public education and outreach efforts.

Additional suggestions for improving riparian habitat include development of stream meanders and undercut banks, installation of large woody debris, planting of appropriate native vegetation and removal of invasive species such as reed canary grass, removal of fish passage blockages, and limiting or prohibiting livestock access into and adjacent to stream channels.
**Open Space**

Open space areas provide a variety of benefits within a community including fish and wildlife habitat and movement corridors, visual breaks in the built environment, buffers between incompatible uses, and passive recreation areas. The Comprehensive Plan Open Space/Greenbelt map should be used as the foundation to identify the community open space system and then refined and expanded to include wetlands and other high priority open space areas. An inventory of all County-owned property should be conducted to determine if any are suitable for incorporation into the community open space network.

Public and private acquisition and conservation efforts should be implemented in order for designated open space areas to become more permanently protected. This can be accomplished in a variety of ways including utilizing Countywide impact fees or initiating an open space bond to fund the acquisition of designated open space areas, promoting open space tax incentives, and coordinating with local land preservation organizations to purchase properties or acquire conservation easements. Public disclosure documents and brochures could help to notify property owners or prospective purchasers that a property is located within a designated open space system.

**Environment Policies**

**Goals**

Maintain, protect, and enhance natural ecosystems, critical areas, and resource lands within the plan area to ensure current and future residents have the opportunity to live, work, and play in a healthy environment utilizing the following:

- Preserve to the maximum extent possible air quality, trees, prairies and oak woodlands, native fish and wildlife, native topsoil, streams, shorelines, wetlands, open space, greenbelts, and other natural habitats.

- Ensure residential and commercial developments are designed to protect the natural features and ecosystems on the site, and promote and provide incentives for development to be designed and sited in a manner that is sensitive to elements of the natural environment and to views of features important to the community.

- Protect and manage vital water resources, including both surface water management and groundwater quality through protecting the sole source aquifer, applying low impact development techniques, and limiting impervious coverage.

- Ensure the preservation of the shoreline and associated habitats of lakes, streams, and other water bodies.

Ensure public education about requirements necessary for environmental protection and non-regulatory ways to further preserve and enhance ecosystems. Make residents and businesses partners in the education process.
AIR RESOURCES

AIR QUALITY

GOAL GR ENV-1  Control the release of particulate matter and negative air emissions resulting from certain land use activities.

GR ENV-1.1  Impose reasonable precautions to reduce dust emissions such as:

GR ENV-1.1.1  Surfacing unpaved roads or surfaces with concrete, asphalt, or compacted gravel or requiring reduced vehicle speeds where surfacing is not feasible;

GR ENV-1.1.2  On construction sites, employing water spray and preventing tracking of mud onto public roadways to reduce dust emissions; and

GR ENV-1.1.3  Covering or wetting truck loads or allowing adequate freeboard to prevent the escape of dust bearing materials.

GR ENV-1.2  Establish regulations regarding air quality related to logging yard and plywood mill operations (glues, laminates, steamers) and rendering plants. Explore voluntary strategies, where feasible.

GR ENV-1.3  Monitor freight rail emissions from railroad freight trains in the Graham area, and take appropriate action toward decreasing any harmful emission levels. Consider the following:

GR ENV-1.3.1  Require the use of cleaner diesel fuel and retrofits to reduce emissions; and

GR ENV-1.3.2  Prohibit locomotives from idling all night.

GR ENV-1.4  Conduct an air quality study to determine if emissions from the Frederickson power plant have an adverse effect on air quality in the Graham area, and take effective action toward eliminating any such adverse effects.

GOAL GR ENV-2  Establish monitoring requirements for the 304th Street landfill operating permit.

GR ENV-2.1  Encourage the Clean Air Agency and TPCHD to establish operating permit conditions to require the landfill to conduct monitoring before the landfill reaches 50 megagrams of National Nonmethane Organic Compounds.

GR ENV-2.2  Require that monitoring data from the 304th Street landfill is submitted to the TPCHD for review to ensure that emissions fall within acceptable federal/state guidelines and condition of approvals.

GOAL GR ENV-3  Encourage the expansion of natural gas to all areas of Graham so that this cleaner alternative is available to residents.

GOAL GR ENV-4  Impose conditions on new development activities to eliminate or limit burn and slash activities.

GOAL GR ENV-5  Work with federal and state agencies and dairy farm operators on methods to reduce negative smells to surrounding areas resulting from the Environmental Protection Agency (EPA) mandated treatments.
GR ENV-5.1 Work with the EPA and the State Department of Ecology to develop new standards that still protect water quality while decreasing negative smells. Consider best management practices for manure composting and manure lagoons.

GR ENV-5.2 Provide information to farmers on farm best management practices (methods and timing) to reduce negative smells.

---

**Noise, Light, and Glare**

GOAL GR ENV-6 Utilize traffic noise abatement paving materials and vegetation during construction of roads to deaden sound to surrounding residential uses.

GR ENV-6.1 Revise the zoning code to require landscaping, at least a minimum standard along major arterial roads.

---

**Earth Resources**

**Soils**

GOAL GR ENV-7 Maintain native soils and minimize impacts of soil disturbance on natural systems.

GR ENV-7.1 Encourage the use of low impact development techniques as a method for preserving native soils.

GR ENV-7.2 Minimize erosion and sedimentation during the land development process.

   - **GR ENV-7.2.1** Require that exposed soils be covered.
   - **GR ENV-7.2.2** Phase clearing and grading activities on large development sites to reduce the amount of exposed soils.
   - **GR ENV-7.2.3** Revegetate disturbed soils as soon as development activities are completed.
   - **GR ENV-7.2.4** Apply a minimum depth of mulch in landscaping areas not covered by vegetation.

GR ENV-7.3 Preserve native soils that support agricultural activities.

GR ENV-7.4 Retain and re-use existing native topsoil during the land development process.

GR ENV-7.5 Reduce the amount of impervious surface areas resulting from development activity within the plan area.

   - **GR ENV-7.5.1** Encourage the use of low impact development to reduce the total and/or effective amount of impervious surface area associated with development.
   - **GR ENV-7.5.2** Develop incentive programs for use of innovative design techniques that reduce impacts from impervious surface areas associated with specific development projects.

---

**Vegetation**

GOAL GR ENV-8 Develop planting and maintenance standards for development activities.
New vegetation should be monitored for at least a 3-year time period, and any vegetation that is unhealthy or dies during this time period should be replaced.

Monitoring and maintenance plans should be submitted for any required revegetation areas.

**GOAL GR ENV-9** Utilize native plants to preserve the integrity of the local ecosystem.

- **GR ENV-9.1** Native plants should be locally grown, acclimated to local growing conditions, and appropriate to underlying soils.
- **GR ENV-9.2** Identify locations in development proposals where installation of native plants is appropriate or required.
- **GR ENV-9.3** Develop incentives for project applicants to encourage restoration of historic plant communities.
- **GR ENV-9.4** Identify, preserve, and restore Oregon white oak woodlands, significant oak stands and trees, and prairies within the plan area.
  - **GR ENV-9.4.1** Map all Oregon white oak woodlands, significant oak stands, significant oak trees, and prairies within the plan area and utilize in critical area review.
  - **GR ENV-9.4.2** Preserve areas that are suitable for the growth of native oak trees.
  - **GR ENV-9.4.3** Retain oaks and prairie plants where these plant species were the dominant historic, indigenous plant community type and maintain the natural setting with appropriate native understory.
- **GR ENV-9.5** Remove invasive, exotic plant species and when possible, restore to the historic, indigenous plant community type.
  - **GR ENV-9.5.1** Educate homeowners on invasive plant species.
- **GR ENV-9.6** Develop a list of native vegetation types that are fire and pest-resistant for planting around structures.
  - **GR ENV-9.6.1** Provide these lists to project applicants.

**WATER RESOURCES**

**SURFACE WATER RUNOFF AND FLOODING**

**GOAL GR ENV-10** Upgrade stormwater facilities (e.g., culverts and ditches) within the plan area, which are undersized and causing flooding problems.

- **GR ENV-10.1** Pursue additional studies of ground and surface water hydrology at the boundaries of Muck Creek and Clover Creek Basins to identify solutions to flooding problems (areas of particular concern are at 224th St. E. and Meridian and 224th St. E. at Muck Creek).
- **GR ENV-10.2** Adequately size new culverts so that flooding problems don’t result from undersizing.
GOAL GR ENV-11  Conduct surface water management projects in a manner that preserves the natural flow of surface water and discharge into its appropriate basin (i.e., avoid any 224th diversions of Muck Creek into another basin).

GOAL GR ENV-12  Design any diversions of water to or from stream channels to protect the integrity of the natural system.

**WATER QUALITY**

GOAL GR ENV-13  Implement strategies to improve water quality within the plan area.

**GR ENV-13.1**  Limit the application of pesticides and fertilizers.

**GR ENV-13.1.1**  Establish a free program to pick up and dispose of banned pesticides/fertilizers.

**GR ENV-13.2**  Provide fencing for domesticated animals to prevent contamination of water resources (e.g., animal excrement).

**GR ENV-13.3**  Provide adequate vegetative cover to maintain appropriate water temperatures and habitat along rivers, streams, lakes, etc.

**GR ENV-13.3.1**  Promote the use of low impact development techniques such as bioretention swales and bioretention areas to address water quality issues.

**GR ENV-13.4**  Coordinate water quality monitoring efforts within the plan area.

**GR ENV-13.4.1**  Instigate a water quality study of the watercourses within the plan area utilizing benthic invertebrates as a monitoring tool.

**GR ENV-13.4.2**  Establish one source location, such as the TPCHD, as a repository for all water quality monitoring data that is collected.

**GR ENV-13.4.3**  Develop lake management plans for the lakes within the plan area (Kapowsin, Tanwax, Whitman, North and South Twin, Morgan, and Clear) that address water quality issues.

**GROUNDWATER AND WATER SUPPLY**

GOAL GR ENV-14  Protect and conserve groundwater supplies and subsurface flows within the plan area.

**GR ENV-14.1**  Limit the amount of impervious surfaces within aquifer recharge areas.

**GR ENV-14.2**  Utilize low impact development (LID) techniques to facilitate water recharge into aquifers, streams, and wetlands.

**GR ENV-14.3**  Reduce the conversion of ditches to culverts, which can cause negative impacts on aquifer recharge and subsurface flow/base stream flows.

**GR ENV-14.4**  Prohibit man-made ponds next to rivers, creeks, and streams that may cause leaching problems to surface and subsurface flows which recharge these watercourses.
GR ENV-14.4.1 When creating ponds to address fire flow issues, use best available science to identify pond location and design to ensure ease of maintenance while minimizing impacts to the natural environment.

GR ENV-14.5 Prohibit landfills and other uses which have the potential to pollute the aquifer and wellhead protection areas.

GR ENV-14.6 Conduct studies to evaluate the effect of well drilling within shallow aquifers located near creeks in the plan area (i.e., to determine impacts to surface water hydrology and base flows).

GR ENV-14.7 Increase public awareness of aquifer recharge and wellhead protection areas.

GR ENV-14.7.1 Mail notices to residents within aquifer recharge and wellhead protection areas. Provide information on how to protect the water quality and water recharge within these areas.

GR ENV-14.7.2 Post signs around the perimeters of aquifer recharge and wellhead protection areas to identify them as a sensitive area.

GR ENV-14.8 Evaluate local aquifers for inclusion as designated aquifer recharge areas.

GR ENV-14.9 Establish measures to retain surface water/groundwater recharge within the Muck Creek system (i.e., stop the loss from Muck Creek to Clover Creek Basin).

GR ENV-14.10 Recommend the use of cisterns, gray water systems, water re-use systems, and drip irrigation systems as a method to conserve groundwater supplies.

GR ENV-14.10.1 Water purveyors should offer incentives for water conservation measures.

**SHORELINES**

**GOAL GR ENV-15** Promote the protection and enjoyment of shorelines within the plan area.

GR ENV-15.1 Eliminate the density bonus associated with shoreline development along rivers, streams, and lakes within the plan area.

GR ENV-15.2 Require public access on lakes as a condition of approval of any land development activity, except for construction of single-family dwelling units.

GR ENV-15.3 Remove old, dilapidated structures (such as cabins) along lake shorelines that have failing or nonexistent sanitary sewer systems.

GR ENV-15.4 Establish a public access point (preferably a park) on Lake Kapowsin that provides for boating, fishing, and picnic facilities.

GR ENV-15.5 Allow the vacation of unopened public rights-of-way at shoreline locations only when another public access on the same water body has been provided as a replacement.

**WETLANDS**

**GOAL GR ENV-16** Promote restoration activities in wetlands that have been degraded.
GR ENV-16.1 Disconnect ditches that drain wetlands.

**Fish and Wildlife Resources**

**GOAL GR ENV-17** Map any neotropical migratory bird habitats and heron rookeries within the plan area.

GR ENV-17.1 Establish bird-friendly design standards for cellular towers.

**GOAL GR ENV-18** Improve riparian habitat through actions such as development of stream meanders and undercut banks, installation of large woody debris, planting of appropriate native vegetation, and removal of invasive species such as reed canary grass, removal of fish passage blockages, and limiting or prohibiting livestock access into and adjacent to stream channels.

GR ENV-18.1 Prohibit or strictly regulate the dredging or alteration of streams.

GR ENV-18.2 Conduct an analysis to determine the cause of low or no base flows in the watercourses within the plan area.

**Open Space**

**Conservation, Restoration, and Maintenance**

**GOAL GR ENV-19** Introduce a variety of strategies to encourage public and private organizations and private property owners to conserve, maintain, and restore open space areas.

GR ENV-19.1 Require new developments to establish homeowners’ maintenance agreements for designated open space areas and native vegetation retention areas.

GR ENV-19.1.1 Require developers/builders to prepare and distribute brochures to prospective and subsequent homeowners regarding maintenance of critical areas and open space areas.

GR ENV-19.1.2 Require notification, prior to the issuance of a building permit, land division approval, or other land development approval, to be recorded on the title of all property that contains an open space area. This title notification shall describe the location and appropriate uses permitted within the open space area. The notice on the title of the property is intended to provide future property owners information regarding any land use restrictions associated with the open space area.

GR ENV-19.2 Require homeowners’ maintenance agreements for natural open space areas and natural buffer areas.

GR ENV-19.3 Develop best construction methods for activities within or nearby designated open space areas and to protect native vegetation retention areas.

GR ENV-19.4 Place a conservation easement on existing and acquired publicly-owned open space sites prior to transfer to a land trust.
Place conservation easements or covenants that restrict future uses to passive and low-impact active open space recreation activities on existing and acquired publicly-owned open space sites. Conservation easements should be worded to maintain open space use and function of a parcel in perpetuity.

The sale of publicly-owned open space areas within the plan area is discouraged. In the event that sales occur, any proceeds from the sales shall be used to purchase an equivalent or greater amount of land for passive open space recreation use or land which provides an equivalent or greater ecological function and value within the plan area.

## Acquisition and Retention

**GOAL GR ENV-20** Encourage acquisition and retention of open space within the plan area through a variety of strategies.

**GR ENV-20.1** Prioritize open space acquisition efforts within the plan area. Special preference should be given to those parcels that:

**GR ENV-20.1.1** Provide important links between existing open space, park and recreation, and school sites;

**GR ENV-20.1.2** Exceed 5 acres in size;

**GR ENV-20.1.3** Sites less than 5 acres in size that provide connectivity to other open space, park, or trail areas; and

**GR ENV-20.1.4** Offer significant views of Mount Rainier or the Cascade Mountain Range.

**GR ENV-20.2** Conduct an inventory of all public properties within the plan area, which may be utilized as open space and incorporated into a greenbelt park trail system.

**GR ENV-20.3** Consider amending the Pierce County Park, Recreation, and Open Space Plan to recommend that impact fees that are collected within the plan area be used to purchase and maintain open space land within the plan area.

**GR ENV-20.4** Encourage preservation of large tracts of open space corridors through site design mechanisms, such as mandatory clustering requirements, and set aside in separate tracts.

**GR ENV-20.5** Promote the Current Use Assessment program Public Benefit Rating System within the plan area.

**GR ENV-20.5.1** Concentrate outreach efforts to those properties located within open space areas depicted in the County’s officially adopted open space/greenbelt map.

**GR ENV-20.5.2** Encourage participation within the program by conducting workshops within the plan area.

**GR ENV-20.6** Develop a process that will facilitate the Purchase and Transfer of Development Rights.
GR ENV-20.6.1 Property designated on the adopted Open Space Corridors Map shall receive the maximum credit (incentive) as a sending site.

GR ENV-20.6.2 Appropriate receiving sites shall not be located within open space tracts, wetlands, geologically hazardous areas, frequently flooded areas, vulnerable deep aquifers, or critical fish and wildlife habitat areas.

GR ENV-20.7 Require developers to use low impact development techniques when developing property located within the designated open space areas as depicted on the Open Space Corridors Map.

IMPLEMENTING ACTIONS

The following list of actions needs to be completed in order to implement the policies contained within this plan. They are arranged according to the timeframe within which each should be completed: short, medium, or long term. Short-term actions should occur within one year of plan adoption. Mid-term actions should be completed within 2-5 years. Long-term actions should be completed within 5-10 years of plan adoption. The entity or entities responsible for leading the effort to complete the action item is listed in parenthesis following the action. Actions are assigned to the Land Use Advisory Commission (LUAC), Pierce County Planning and Land Services (PALS), Pierce County Economic Development (ED), Pierce County Parks and Recreations (Parks), Pierce County Public Works & Utilities (PWU), and Tacoma-Pierce County Health Department (TPCHD).

SHORT TERM ACTIONS (UPON PLAN ADOPTION TO 1 YEAR)

1. Amend the County Comprehensive Plan Open Space/Greenbelt Map to adopt the changes set forth in the Proposed Open Space/Greenbelt Refinements Map. (PALS, Parks)
2. Work with the local land trusts, Nisqually Tribe, Tahoma Audubon, and Pierce County WSU Cooperative Extension Office to conduct workshops within the plan area to promote participation in the Current Use Assessment Public Benefit Rating System. (PALS, Parks)
3. Conduct a meeting or series of meetings with the local land trusts to discuss the adopted Open Space/Greenbelt Map and open space acquisition priorities and opportunities. (PALS, Parks, Land Trusts)
4. Conduct an analysis to determine the feasibility of placing an open space tax initiative (RCW 82.46.070) on the ballot. (Parks)
5. Work with local land trusts and environmental organizations to sponsor properties within the plan area for acquisition through the Conservation Futures Program. (PALS, Parks)
6. Utilize the open space network map when delineating proposed major and minor trail systems. (PALS, Parks)
7. Amend Title 18J, Design Standards and Guidelines to establish design standards for construction that is located within designated open space/greenbelt areas. Integrate green building techniques into these design standards. (PALS)

8. Amend the Pierce County Critical Area regulations to reference the oak woodland and prairie map into the Critical Areas Atlas.
   • Establish a streamlined permit process for vegetation restoration projects.
   • Require property disclosure requirements to notify prospective purchasers that a wetland or fish and wildlife habitat area exists on the parcel.
   • Provide criteria for road development in known wildlife movement corridors.
   • Require the removal of illegal wetland fill and restoration to original functions and values.
   • Establish the requirement for developers/builders to provide homeowner education on open space/critical area maintenance.

9. Amend Title 18A, Pierce County Zoning Code to reduce the levels of density and intensity of allowable uses within those portions of the natural environment that contain critical areas and open space corridors by implementation of a Rural Sensitive Resource Zone. Adopt design criteria (such as clustering and building construction), and site development standards (such as Low Impact Development, maximum impervious surface coverage, minimum vegetation retention, and open space dedication) within this zone.

**Mid-Term Actions (1-5 years)**

1. Complete an update to the Pierce County Shoreline Master Program. Actions included in the SMP update should include:
   • Correct errors to the Pierce County Shorelines Atlas.
   • Create new Shoreline Environment designations in several locations.
   • Identify potential location for additional public access points.
   • Eliminate shoreline density bonus provisions. (PALS)

2. Establish a process to use countywide park impact fees to purchase designated open space properties.

3. Amend Title 18A, Pierce County Zoning Code to eliminate shoreline density bonus provisions.

4. Amend the County’s subdivision and platting regulations to establish a requirement for developers/builders to provide homeowner educational material on open space and critical area tract maintenance. (PALS)

5. Complete watershed basin plans, which will include the following:
   • Identify potential flood hazard/prone areas
   • Establish water quality baselines and monitoring data for the streams, lakes and wetlands within the plan area and also those systems that serve as stormwater receiving areas outside the plan area.
   • Identify sites for potential acquisition and where restoration activities would have the most benefit.
Identify high priority capital improvement projects to reduce or eliminate flooding problems on 224th St. E. (PWU-WPs)

6. Conduct an inventory of publicly owned properties located within the adopted open space network to determine suitability for long-term stewardship and management as permanent open space and:
   - Place conservation easements on those parcels designated for permanent open space.
   - Prepare long-term management plans for any parcels identified for permanent open space.
   - Initiate transfer of these properties to a local land trust for long-term management and stewardship. (PALS, Parks, Land Trusts)

7. Provide online access to environmental constraints on a parcel of land and educational materials on environmental stewardship techniques at the Pierce County PALS Development Center. (Parks, WSU Cooperative Extension Office)

8. Amend the County Public Works and Utilities protocols to require the reconstruction of infrastructure that acts as a barrier to fish or any wildlife passage when any public road or utility project would affect or be affected by the blockage. (PWU)

**LONG TERM ACTIONS (5-10 YEARS)**

1. Adopt detailed inventories of flood hazard areas within Pierce County to augment the FEMA Flood Insurance Rate Maps and Flood Boundary Hazard Maps. (PWU-WPs)
2. Implement an annual on-site septic performance test program to determine whether these systems are functioning properly. (TPCHD)
3. Develop and implement a long-term water quality monitoring program. (TPCHD, PWU, PALS, DOE, WSU-Cooperative Ext.)
4. Promote efforts to remove non-native plants throughout the plan area. (Nisqually Tribe, Conservation District)
Hydrologic Soil Groups

- **Group A**: Low runoff potential, soils with high infiltration rates, consisting of deep, heavy textured soils and gravel; high rate of water infiltration.
- **Group B**: Moderate to moderate: runoff potential, soils with moderate infiltration rates, consisting of moderately deep to deep, moderately well-drained soils with moderately fine to medium coarse textures; moderate rate of water infiltration.
- **Group C**: Moderate to high runoff potential, soils with slow infiltration rates, consisting of soils with a layer that impedes downward movement of water, or soils with moderately fine to fine texture; slow rate of water infiltration.
- **Group D**: High runoff potential, soils with very slow infiltration rates, consisting of clay soils with high runoff potential, soils with a permanent high water table, soils with a deep pervious layer at or near the surface, and shallow soils over nearly impermeable material; very slow rate of water infiltration.

Potential Landslide Hazard Areas

Adopted October 19, 2004 - Ord. #2004-56s
Effective March 1, 2005

Pierce County Code Title 196 regulates activities within Landslide Hazard Areas.

The boundaries of landslide hazard areas are approximate and are intended only to provide an indication of the presence of landslide hazard areas. Additional landslide hazard areas that have not been mapped may be present.

Chapter 5: Economic Element

Introduction

Economic development refers to actions of the public and private sector which encourage the creation or continued existence of a stable employment and tax base. A strong local employment base provides an opportunity for plan area residents to earn a living in their communities which, in turn, supports local businesses generating additional tax revenues that support community needs. Having a strong local employment base also reduces the pressure on our regional transportation system.

Economic development actions can either be broad or targeted towards specific types of businesses, specific wage levels, active recruitment of businesses that offer goods and services missing in the community, and enhancement to existing businesses and industries. Targeting actions to ensure adequate areas for commercial and industrial development, preserve natural resource industries, and protect home-based businesses are economic development strategies that can be employed as a means of generating economic growth in specific areas of the plan area.

Description of Current Conditions

Work Force

Education Level

The level of educational attainment within the plan area is similar to that found throughout the rest of Pierce County. The highest percentages of people 25 years or older have either a high school diploma or some college with no degree. The population with an Associates degree is slightly higher than the County average; while a smaller proportion of individuals have more advanced degrees (see Table F-19).

### Occupations

The diversity of occupations found within the plan area is similar to the rest of Pierce County. Over 50 percent of the population within the plan area who are 16 years or older work in occupations related to management, professional services, sales or office work. The smallest percentage of the work force participates in natural resource (farming, fishing and forestry) industries. The number of people who work in construction, extraction and maintenance occupations is significantly higher within the plan area (see Table F-20).

### Labor Force

The majority of people, age 16 or older, who live within the plan area are employed as civilians. The population within the plan area who are either employed in the military or not participating in the labor force is less than the average for Pierce County and the number of unemployed is the same (see Table F-21).

INCOME

The average median household income within Pierce County is $46,807 and $54,716 within the plan area, which is approximately $8,000 a year higher than Pierce County as a whole. The number of people earning wages from self-employment is higher within the plan area than the average for Pierce County, perhaps reflective of those employed in the construction industry. Individuals claiming wages from social or supplemental security is significantly less within the plan area, while other sources of income are comparable between the plan area and the rest of the County (see Table F-22).

TRAVEL TIME TO WORK

The majority of the work force within the plan area spends 30 minutes or more commuting to work indicating that the plan area is a "bedroom" community to more metropolitan areas. A small percentage of people within the plan area work at home and have no travel time which could reflect natural resource industries such as agriculture or home-based businesses (see Table F-23).

### Employment

#### Size of Firms

Within the plan area, most private sector businesses employ 10 or fewer employees, with relatively few firms employing 25 or greater people. As a contrast, most government and education related employers have greater than 50 employees (see Table F-24).

Firm Categories | Number of Employees | Number of Firms | Average Employees per Firm
--- | --- | --- | ---
10 – 24 employees | 418 | 28 | 14.9
25 – 49 employees | 227 | 6 | 37.8
50+ employees | 1380 | 15 | 92.0

**INDUSTRY EMPLOYMENT**

Information from March, 2003 quarterly employer’s reports show that Construction is the largest industry sector in Graham in terms of both number of employers and number of people employed. Second in terms of number of firms is Other Services, which includes a range of businesses from repairs and religious activities to laundry and personal care. Second in terms of employment is Retail Trade (see Table F-25).

COMMERCIAL AND INDUSTRIAL LANDS

Industrial and commercial zoned lands provide areas for economic development within the plan area. The Pierce County Comprehensive Plan designates lands for industrial and commercial uses throughout the plan area and the County. The Land Use Element – Description of Existing Conditions provides a more detailed overview on the status of vacant and redevelopable commercial and industrial lands within the plan area.

DESCRIPTION OF DESIRED CONDITIONS

GENERAL

The economic goal for the Graham community plan area is to provide opportunities for businesses to successfully locate within the plan area, at locations and a scale appropriate to the envisioned rural character. Many elements are required to make a business successful. Companies must be adequately capitalized, have competent management and must produce a product or service that is in demand. The elements necessary for businesses to flourish in Graham include:

- Providing a market sufficient for the trading of goods and services
- Enacting a regulatory environment that is predictable, timely and easy to understand
- Developing a tax structure that doesn’t preclude operating a business
- Adopting a “business friendly” attitude in government
- Building adequate public infrastructure to support market growth
- Designating a sufficient quantity and quality of locations for new businesses

NATURAL RESOURCE INDUSTRIES

Graham is a rural community with a rich heritage based on natural resources. The rural character should be preserved and viewed as an economic opportunity. That is best achieved by promoting and facilitating forestry and agricultural uses. Some incentives to encourage natural resource industries include providing tax reductions and transfer of development rights. Existing agricultural and forestry uses should be protected from new development through title notification requirements and right to farm provisions. Finally, marketing opportunities such as a farmers market should be explored as a venue for locally produced agricultural commodities.

HOME OCCUPATIONS AND COTTAGE INDUSTRIES

Home occupations and cottage industries are deeply imbedded in the fabric of this rural business community. When the entrepreneurial spirit is nurtured, the result is innovation in products and services that represent great economic opportunities. Often that innovation is “home grown.” At the same time, home-based business should be harmonious with the rural character of the community. Development standards should allow for home-based businesses
and also provide guidelines for when these businesses should relocate into a commercial or industrial area.

**TOURISM**

Tourism can provide significant economic opportunities. The goal of keeping Graham’s rural character intact by accentuating forestry and agricultural uses and natural amenities is compatible with providing recreational tourist activities. New tourism related opportunities could be developed in conjunction with the city of Tacoma’s "Train to the Mountain" project. Transportation facilities could be provided to companion destinations such as Northwest Trek and Pioneer Farm, and Lake Kapowsin. Other facilities could be added that could support tourism including expanding park and recreational facilities, building centers or exhibition areas for arts and crafts, and increasing the number lodging and dining businesses such as Bed & Breakfasts. The local Chamber of Commerce and local business associations could help promote tourism within the greater Graham area.

**COMMUNITY IMAGE**

The design and upkeep of the built environment can have a dramatic impact on how the character of a community is perceived. In order to realize the full commercial potential within the plan area, Graham must project an image that is inviting to new businesses and the traveling public. Businesses and signage should be designed and integrated to provide a sense of community and project a rural atmosphere. Local business associations could promote activities that foster a sense of community, which in turn could attract tourism.

**COMMERCIAL CENTERS**

To maintain a livable community, there must be an appropriate balance between business and residential properties. In order for that to occur, there must be a sufficient amount of land designated for commercial and industrial development. Installation of necessary infrastructure must be timed to keep pace with proposed development in commercial centers. The amount of revenue needed to support new services and capital improvements should be allocated to support anticipated commercial and industrial development.

**ECONOMIC DEVELOPMENT POLICIES**

**GOALS**

Provide opportunities for businesses to successfully locate in the plan area at locations and a scale appropriate to the rural character envisioned for the area.
NATURAL RESOURCE INDUSTRIES

GOAL GR EC-1  Encourage agricultural and forestry industries within the community.

   GR EC-1.1  Encourage retention of properties of sufficient size to make agriculture/forestry economically feasible.

   GR EC-1.2  Ensure agricultural uses are allowed broadly within the plan area.

   GR EC-1.3  Develop marketing opportunities for agricultural products, such as farmers markets within and outside the community, cooperative marketing and purchasing, education on the business of agriculture, promotion of subscription farms, etc.

   GR EC-1.4  Require title and plat notification of lands adjoining natural resource uses acknowledging the presence of these uses.

TOURISM

GOAL GR EC-2  Develop and promote tourism consistent with rural community goals, infrastructure, and growth patterns of the community.

   GR EC-2.1  Conduct an inventory of public access points to the many lakes and waterways within Graham to determine the best places for environmentally suitable aquatic recreation.

   GR EC-2.2  Develop themed signage and clearly mark public access points to lakes and waterways.

   GR EC-2.3  Develop tourism opportunities in conjunction with the Train to the Mountain.

   GR EC-2.3.1  Approach Tacoma Rail about developing a terminal for the Train to the Mountain, and determine the feasibility of creating a commercial district, farmers market, or park around the station.

   GR EC-2.3.2  Provide a shuttle system to transport visitors from the train station to Northwest Trek and Pioneer Farm.

   GR EC-2.4  Support the Rail and Trail effort underway to build a trail the length of the Tacoma Rail route from Tacoma to Mount Rainier.

   GR EC-2.5  Develop destination facilities such as a rowing center on Lake Kapowsin or park facilities at Lincoln Tree Farm with interpretive presentations of the working forest.

   GR EC-2.6  Promote the arts through art shows, exhibits, galleries, etc.

   GR EC-2.7  Promote family activities such as camping, petting farms, paint ball, etc.

   GR EC-2.8  Increase the number of lodging and dining facilities.

   GR EC-2.9  Provide information to the touring public on recreational opportunities in Graham.

   GR EC-2.10 Partner with the Chamber of Commerce and local business associations to help promote Graham businesses to the touring public.
**Implementing Actions**

The following list of actions needs to be completed in order to implement the policies contained within this plan. They are arranged according to the timeframe within which each should be completed: short, medium, or long term. Short-term actions should occur within one year of plan adoption. Mid-term actions should be completed within 2-5 years. Long-term actions should be completed within 5-10 years of plan adoption. The entity or entities responsible for leading the effort to complete the action item is listed in parenthesis following the action. Actions are assigned to the Land Use Advisory Commission (LUAC), Pierce County Planning and Land Services (PALS), Pierce County Economic Development (ED), Pierce County Parks and Recreations (Parks), Pierce County Public Works & Utilities (PWU), and Tacoma-Pierce County Health Department (TPCHD).

**Short Term Actions (Upon plan adoption to 1 year)**

1. Amend Title 18I, Natural Resource Lands to require title and plat notification for lands adjoining agricultural uses acknowledging the presence of the agricultural use and that continuation of the agricultural activities may result in impacts to new residents. (PALS, Farm Advisory Commission)
2. Amend Title 18J, Design Standards and Guidelines to incorporate design standards and guidelines for cottage industries. (PALS)
**Mid-Term Actions (1-5 Years)**

1. Develop and adopt regulations regarding "transfer of development rights." (PALS)
2. Work with local agencies and groups to promote agricultural activities such as: cooperative marketing and purchasing of agricultural products, subscription farms, and education on the business of agriculture. (PALS, Graham Business Association, Farm Bureau, Farm Advisory Commission, WSU Cooperative Extension Office)
3. Amend Title 18A, Zoning to incorporate operational standards that serve as a guide to when a home-based business should relocate into a designated commercial area. (PALS, Economic Development)
4. Work with local agencies and groups to promote the Current Use Assessment Program for productive farm and agricultural lands and timberlands. (PALS, A/T Office, Farm Bureau, Farm Advisory Commission, WSU Cooperative Extension Office)
5. Conduct an inventory of public access points to waterbodies and watercourses within the plan area to determine best locations for aquatic recreation areas. (PALS, Parks)
6. Coordinate with local agencies and groups to develop Train to the Mountain facilities. (PALS, C&E Development, Graham Business Association)
7. Conduct a study to determine the amount of revenue needed to support needed services and desired capital improvements versus the anticipated revenue generated by various development patterns. (PALS, C&E Development, Graham Business Association)
8. Review current standards contained in development and construction and infrastructure regulations to determine if the thresholds for home occupations, cottage industry I, and cottage industry II categories are appropriate and reconcile any contradictions between residential and commercial character; amend as necessary. (PALS)

**Long Term Actions (5-10 Years)**

1. Install signage to clearly mark public access points to waterbodies and watercourses within the plan area. (PALS, Parks, PWU)
2. Develop a rowing center on Lake Kapowsin. (PALS, Parks, C&E Development, Graham Business Association)
3. Work with local agencies and groups to develop a farmers market within the plan area. (PALS, C&E Development, Graham Business Association, Farm Bureau, Farm Advisory Commission, and Washington State University Cooperative Extension Office)
4. Work with local agencies and groups to promote tourism related industries (e.g., expand lodging and dining opportunities and develop tourism related brochures) and arts and crafts related industries (e.g., art shows, exhibits, galleries, and markets) within the plan area. (PALS, C&E Development, Graham Business Association)
Chapter 6: Facilities and Utilities Element

**INTRODUCTION**

The Facilities and Services Element articulates needs for facilities and services to implement the visions and goals of the community’s plan. Facilities and services are collectively considered infrastructure and may include public or privately funded projects. Policy statements regarding infrastructure provide direction to investors and decision-makers about investments desired and needed by the community. This element also prioritizes some of the projects and may suggest potential funding sources to acquire or construct facilities or provide services.

**DESCRIPTION OF CURRENT CONDITIONS**

**CAPITAL FACILITIES PLANNING IN PIERCE COUNTY**

The Pierce County Comprehensive Plan contains a Capital Facilities Element, often referred to as the Capital Facilities Plan (CFP). The CFP is a six-year plan for identifying and financing countywide capital improvements that support the County’s current and future population and designated land uses. The CFP is based on projected needs for capital facilities for the next 20 years, given current trends and expenses and is updated annually. Application of level of service (LOS) standards is a method for identifying needed capital improvements. LOS standards state the acceptable quantity and quality of a facility or service; expressed as unit of population, housing, acreage, square footage, gallons, vehicles per hour, waiting time, or similar unit of measurement.

**SEWER AND WASTEWATER TREATMENT**

**SEWER COLLECTION AND WASTEWATER TREATMENT FACILITIES SERVING THE PLAN AREA**

Approximately 13.5% of the Graham Community Plan area lies within the Chambers Creek Regional Wastewater Treatment Plant (WWTP) service area as identified in the Unified Sewerage Plan, 2001, (4.5% within urban service area and 9.0 % rural service area). The remainder of the Graham Community Plan area lies outside of any jurisdictions’ sewer service area.

Pierce County currently provides sewer service to 146 acres (568 properties) within the urban service area and 273 acres (901 properties) within the rural service area. Existing sewerage flow from the Graham Community Plan area accounts for approximately 0.3 million gallons per day (MGD). Existing wastewater collection facilities within the Graham Community Plan area consists of approximately 11.3 miles of 8- through 18-inch pipeline, (3.1 miles in the urban service area and 8.2 miles in the rural service area). Current sewer customers in the rural service area connected to the sewer system prior to 1994 or had entered into a Binding Agreement executed prior to implementation of Growth Management Plan.
The Chambers Creek Regional Wastewater Treatment Plant (CCRWWTP) service area encompasses approximately 95,345 acres (149 square miles) of land. The service area includes the Cities of Lakewood, DuPont/Northwest Landing, University Place, Milton, the Town of Steilacoom, as well as the Tacoma Western Slopes area (WSLP), and the unincorporated communities of South Hill, Parkland, and Spanaway. The CCRWWTP is currently rated at 28.7 million gallons per day (MGD) at average daily flow of 16.7 MGD (2005). Equipment at the WWTP is periodically upgraded or fine-tuned to keep pace with performance requirements established by the State of Washington through the NPDES (National Pollution Discharge Elimination System) permit. Each year’s capital improvement program includes equipment upgrades. Treatment plant operators are constantly refining processes to achieve the maximum reduction of suspended solids, biological oxygen demand, chlorine, and nutrients in treated wastewater being discharged to South Puget Sound.

**Overview of Current Sewer and Wastewater Treatment Plans, Policies and Regulations**

Sewer Service in the Graham Community Planning area is governed through the *Unified Sewer Plan for the Pierce County Wastewater Utility, 2001 and Chapter 13 of the Pierce County Code*. In addition, the Pierce County Comprehensive Plan policies play an important role in which properties can receive sewer service in the Graham Community Plan area. As part of a strategy to channel urban intensity development into designated urban growth areas, the Pierce County Comprehensive Plan directs that sanitary sewers be provided almost exclusively to urban areas. Since portions of the Pierce County Wastewater Utility’s pre-existing service area, designated pursuant to Chapter 36.94 RCW, was classified “rural” pursuant to Chapter 36.70A RCW when the Comprehensive Plan was adopted, specific policies had to be adopted to handle sewer service issues in these rural areas.

The Comprehensive Plan limits when sewer connections may occur, in rural areas, to the following instances:

- Where sanitary sewer service will remedy ground water contamination and other health problems by replacing on-site sewer (septic) systems;
- Where a formal binding agreement to service an approved planned development was made prior to the establishment of an Urban Growth Area (i.e., where there is a binding sewer agreement.); and
- Where current connections exist. [Current connections paid for treatment and conveyance system capacity that obligates the sewer utility to continue to provide service as long as the property owner or resident abides by the sewer regulations.]

Interceptors constructed within and through areas designated “Rural” cannot be made available for individual connections except as provided for in the County Comprehensive Plan.

**Level of Service Standards**

Level of service for sanitary sewers is established in the Capital Facilities Element of the Comprehensive Plan. LOS was set at 220 gallons per residential equivalent (RE), (i.e., in planning for collection system and treatment capacity, one single-family residence is expected to contribute 220 gallons of wastewater per day). A multifamily residence is 0.83 RE.
Commercial and industrial land uses are expected to contribute 1,000 gallons of wastewater per day per acre.

**PROPOSED SEWER SERVICE FOR THE PLAN AREA**

The Unified Sewer Plan identifies three major conveyance system improvements within the Graham Community Plan area; none of which are on the current Six-Year Wastewater CIP. (See Map F-37: Sewer Service - Existing Sewer Lines) The Muck-Kapowsin Trunk and Elk Plain Trunk both fall within the rural service area and will not be considered for the Six-Year Wastewater CIP until a change occurs in the land-use designation of surrounding properties or unless sewers are necessary to remedy ground water contamination and/or other health problems. The majority of all system expansion, within the urban service area, will occur by means of developer extension. Only one remaining binding agreement remains in the Graham Community Plan area, (Rock Family Trust Binding Agreement property, Parcel #401500-009-0). No other improvements are proposed for the rural service area.

**DOMESTIC WATER**

The majority of the community plan area located within the urban growth area is provided water services by the Rainier View, Southwood/Sound water system, or Firgrove Mutual Water. These systems obtain water from groundwater wells located within their service area and from outside regional water sources via the City of Tacoma and are currently operating under water system plans approved by the Washington State Department of Health.

**OVERVIEW OF CURRENT DOMESTIC WATER SUPPLY AND WATER SYSTEM PLANS, POLICIES AND REGULATIONS**

Numerous water related plans, programs or processes occur at the State, County, WRIA, or individual water system service area level which address domestic water supplies in some manner, including, the Pierce County Comprehensive Plan, the Pierce County Coordinated Water System Plan, 2001, the Nisqually Watershed Management Plan, October, 2003, and individual water purveyor water system plans. Additionally, numerous regulations impact the provision of water service, including Pierce County land use development regulations and Chapter 173-511 WAC (Instream Resources Protection Program – Nisqually Water Resource Inventory Area 11).

For example, the Pierce County Coordinated Water System Plan requires water systems to plan for growth based upon the land use designations and growth projections contained in the Pierce County Comprehensive Plan. Water system plans are required to be developed and approved by the Washington State Department of Health for water systems meeting specific conditions. The Instream Resources Protection Program (173-511 WAC) has closed several streams in the Nisqually WRIA to further water appropriations, including associated groundwater resources impacting such closed streams. Additionally, water systems must meet local fire flow standards and no new individual wells are allowed within the Pierce County urban growth area, except for special circumstances. Water system plans serve as road maps for the operation of a water system and are required to be consistent with the growth.
projections and zoning requirements of the land use authority within the service area. It is through the development of such plans that water systems justify their ability to provide timely and reasonable water service to their exclusive service area.

**Water Systems Serving the Plan Area**

Domestic water within the Plan area is provided by a combination of individual on-site wells, small Group B water systems and approximately 20-25 Group A water systems. The portion of the plan area located within the urban growth boundary is primarily served by the Rainier View, Southwood/Sound Water System, or the Firgrove Mutual Water System. Due to low density development patterns in the remainder of the plan area, a large portion falls outside the designated service area of any Group A water system and, instead, is considered undesignated in terms of public water service. Within such an area, individual “exempt” wells or small Group B public water systems utilizing an exempt well are most likely to occur in the future. A notable exemption is the Graham Hill Mutual Water Company which provides water service to a large portion of the plan area outside the urban growth area. In other instances, past projects have been developed on Group A water systems; however, in the majority of such cases, the water systems have no plans to expand beyond existing plats. (See Map F-38: Water Systems)

The majority of the Group A water systems operating within the community plan area are not required to develop individual water systems plans. The water systems which do have Washington State Department of Health approved water system plans include: Firgrove Mutual, Rainier View, Southwood/Sound, Graham Hill Mutual Water Company, Sunwood Water System, and El Dorado/Country Water System (a portion of the Valley Water District). Of these, the Graham Hill Mutual Water Company has the most pressing need for new water resources (water rights) to serve anticipated growth.

Outside designated water service areas, wells exempt from the requirement to obtain a water right are expected to provide water service to new growth. However, such an exempt well may not be exempt from the established instream flow rule for the Nisqually WRIA, WAC 173-511. WAC 173-511-070 allows for a single domestic use of water only if the cumulative effects of numerous single domestic uses do not impact the quantity of water available for instream uses. If they do, then only domestic in-house use is allowed if no other source is available.

**Issues Facing Water Purveyors**

Generally speaking, providing a safe, sustainable supply of water to a growing population is getting more and more difficult for water purveyors across the State. Balancing the need for water for people with the needs of fish, wildlife and the natural environment is a major challenge. Water is a finite resource with a growing demand and how we live and use water have significant cumulative impacts on how much water is available and how clean the water is. Educating users of water of this in a typically “wet” environment is a challenge facing water purveyors. The lack of understanding of the interaction between groundwater and streams and, therefore, the lack of general knowledge of how much water is available for additional out of stream uses is a concern as well. Essentially, how to manage the State’s water resources into the future is at issue.
Water purveyors may use and promote water conservation methods as a means of ensuring sufficient water supplies for growth. Conserved water is water that does not have to be purchased or conveyed so it is cost-effective. Water conservation can be frustrated by development regulations and homeowner covenants that require extensive irrigated landscaping and similar features. Water conservation can be enhanced by requiring plumbing fixtures that conserve water, instituting leak detection and correction programs, and by developing strict irrigation and landscaping standards. Care in requiring landscaping that does not demand extensive irrigation for its survival will help as will emphasis in landscaping standards that require the use of indigenous plant materials and in land clearing regulations that limit the extent of native vegetation removal.

At this time, it can be extremely difficult, if not impossible, to obtain a new water right from DOE due to staffing limitations, lack of needed information and the closure status of streams, among other reasons. How to balance water resource needs into the future, thereby providing water for both instream and out of stream uses, is an important issue facing many areas of the State, including Pierce County and the Graham Community Plan area.

For water systems operating in the urban growth area of the community planning area, the use of available regional water is possible, and is occurring, due to the water systems’ ability to intertie with others. Such a solution may not be feasible for more isolated Group A public water systems operating in the community plan area outside the urban growth area, but still facing growth issues despite rural zoning. The implementation of the Nisqually Watershed Management Plan in the cooperative manner in which it was developed could have a positive impact on water systems’ ability to obtain new water rights into the future.

**TRANSPORTATION**

| OVERVIEW OF CURRENT TRANSPORTATION PLANS, POLICIES, AND REGULATIONS |

The planned transportation policies and projects currently adopted for Graham can be traced to the Pierce County Transportation Plan (PCTP), which was adopted in 1992. The PCTP was the result of a four-year intensive public effort to develop Pierce County's first all-encompassing transportation plan that set policies and prioritized transportation improvements for the following twenty years. Six separate Focus Area Advisory Committees (FAACs) were involved in the PCTP process. Portions of the current community plan area are within the boundaries of the Mid-County and South County Focus Areas.

In 1994, the Pierce County Comprehensive Plan was adopted in response to the Washington Growth Management Act (GMA). The Comprehensive Plan incorporated the transportation policies and recommended transportation improvements of the 1992 PCTP. The Comprehensive Plan summarized a newly developed system for coordinating the planning, funding, programming and construction of transportation improvements with future land development. This concept, known as transportation concurrency, continues to play a significant role in completing transportation improvements throughout Pierce County.
**TRANSPORTATION FACILITIES SERVING THE PLAN AREA**

The transportation system within the Graham Community Planning area can generally be described as rural in nature. The roadway network is not a fully developed “grid system,” as is usually the case in urban areas. Many of the roadways are very narrow. There is very limited transit service and very few facilities to accommodate bicycles and pedestrians.

**ROADS AND HIGHWAYS**

The plan area is serviced by two main state route highways (SR 7, Mountain Highway, and SR 161, Meridian). SR 7 is designated as a Scenic and Recreational Highway throughout the entire plan area. The road system along SR 7 has wide shoulders that, for the most part, provide adequate separation to ditches. SR 161 has very narrow shoulders, with ditches right up alongside the travel ways. Many of the County roads are very narrow, with no shoulders and deep ditches running parallel to the travelway. The design of the roadway system within the plan area hinders pedestrian and other types of nonmotorized movement (biking, horseback riding, etc.) In addition, there is an abundance of wildlife within the plan area, which sometimes results in accidents caused from collisions between vehicles and animals, particularly elk and deer.

Over the last several years, the Washington State Department of Transportation (WSDOT) has worked on two Route Development Plans (RDPs) for portions of SR 161 (Meridian) that traverse the plan area. WSDOT commenced a RDP on SR 161 from 234th St. E. south to its intersection with SR 7, in the spring of 2003. In addition, a RDP was completed in the 1990s for SR 161 north of 234th St. E. This RDP recommended widening SR 161 to four lanes plus channelization between 176th St. E. and 234th St. E. Construction on this project has begun and should be completed sometime in 2006.

**RAIL SERVICES**

The Tacoma Rail Mountain Division operates the only railroad line within the Graham Community Plan area. The length of rail line running through the community plan area is approximately 13.5 miles. This is part of 132 miles of track in the Mountain Division. Currently freight is carried on this track between Frederickson, Lewis County, and the Port of Tacoma.

Passengers may be carried on the rail lines in the future. One possibility is to run a passenger train from Frederickson to connect to the Sound Transit regional rail in downtown Tacoma. An excursion opportunity is a train between Freighthouse Square in Tacoma and the proposed Inn at Park Junction located near Elbe/National. The “Train to the Mountain” is in the planning stages and will require substantial upgrade of track and right-of-way to allow operations at greater than 20 mph.
PUBLIC TRANSPORTATION

The community plan area is served by Pierce Transit Route 402. Route 402 travels from the Roy ‘Y’ Park & Ride lot (SR 7 at SR 507) south on SR 7, east on 224th St. E., then north on SR 161. The route continues north to the South Hill Mall Transit Center, Puyallup Sounder rail station, and the Federal Way Park & Ride lot. Service is on an hourly basis on weekdays and weekends. The portion of plan area north of 224th St. E. is also served by the Mid-County Bus Plus service. Bus Plus is a “by request” service that runs on weekdays from 6 a.m. to 9 p.m.

LAW ENFORCEMENT AND FIRE PROTECTION

LAW ENFORCEMENT AGENCIES SERVING THE PLAN AREA

PIERCE COUNTY SHERIFF’S DEPARTMENT

The Pierce County Sheriff’s Department (PCSD) is the primary law enforcement agency for the plan area. There are four patrol districts that serve the area; however, there are not any police stations located in the plan area. The majority of the area is serviced by the Mountain Detachment, Pierce County District 10, which is headquartered in Eatonville. This unit serves a total of 40,195 acres of the plan area. The Foothills Detachment, Pierce County District 12, which is headquartered in Bonney Lake, serves 883 acres of the plan area. The South Hill Precinct, Pierce County District 6, located in South Hill serves 6,571 acres of the plan area. Pierce County District 7 serves the remaining 1,299 acres of the plan area. All of these facilities provide continual, but not exclusive service to the plan area as follows:

- The Mountain Detachment consist of three sergeants, 19 deputies, and an office assistant that provides police services and patrols to the majority of citizens in the plan area.
- The Foothills Detachment consist of three sergeants, 21 deputies, and an office assistant, which provides police services to the areas around Orting, Buckley, and Bonney Lake in addition to a small part of the plan area. The Detachment is located in office space located next to the Safeway in Bonney Lake.
- The South Hill Precinct provides patrol deputies and support, along with property crime detectives, clerical support, the Youth Emergency Services Unit and the Crime Analysis Unit.
- The County-City Building is the location of most of the rest of the PCSD services, including Administration, Civil, Major Crimes Detectives, Forensics, Special Investigations Unit, and the Recruiting and Training sections.

Six detectives are housed at the South Hill Precinct and their primary duty is to investigate property crimes. In addition, 22 detectives and deputies work from the County-City Building in the Criminal Investigations Division. Those people are assigned to a variety of tasks from investigating major crimes (homicide, special assault, arson, etc.) to investigating domestic violence related incidents to crimes involving juvenile suspects to executing felony arrest warrants. The area of responsibility for these resources is the entire unincorporated County (including the plan area), as well as providing contracted services to various cities in Pierce
A growing group of undercover investigators is dedicated to drug enforcement issues in Pierce County.

In addition to the above-described services, the plan area benefits from the ability of the PCSD to provide additional special services to its citizens. These special services are made possible by training personnel to perform more than their primary (patrol, investigations) function. These personnel respond to situations on an as-needed basis. These functions include: Air Operations, Clandestine Lab Team, Dive Team, Hazardous Devices Squad, Marine Services Unit, Bicycle Unit, Search and Rescue, SWAT, and Swiftwater Rescue.

**Washington State Patrol**

The Washington State Patrol’s office is located at 2502 112th St. This office dispatches four detachments to eastern Pierce County covering state highways in the plan area. They respond to a variety of calls for service ranging from standard traffic stops to vehicular accident investigation. The number of troopers in the plan area varies from two to three depending on the calls for service in other areas of Pierce County.

**Fire Protection Districts Serving the Plan Area**

The community plan area is serviced by four different fire districts. The plan area contains all of Fire District No. 21 and only one station from the other fire districts: District Six – Station Four, District Fifteen – Station Two, and District Eighteen – Station Three.

**Pierce County Fire Protection District # 21**

Fire District No. 21 serves an area of approximately 110 square miles. The district responds to over 3,500 calls per year with approximately 72% of the calls related to medical aid. District No. 21 headquarters is at 10012 187th St. E. There are a total of five fire stations in the district, all located within the plan area boundary. The district also owns vacant land located in Frederickson and on 238th and Meridian.

The district offers a variety of services other than fire protection such as CPR and first aid classes and burn regulation information. The district’s equipment consists of three medic units, six engines, one ladder, three medic units, two water tenders, one brush truck, eight utility vehicles, one car, and one parade engine. The fire district has 95 employees in the following roles: three commissioners, one administrative chief, one deputy chief, one training captain, one district secretary, one administrative assistant, two secretaries, one data entry clerk, one public educator, three battalion chiefs, six lieutenants, 17 fire fighters, 13 fire fighters/paramedics, 33 volunteer fire fighters, and 10 chaplain personnel.

**Pierce County Fire Protection District # 18**

Fire District No. 18 has one station in the community plan area (Station 18-3), which serves as the headquarters. This station is located at 19502 Orting-Kapowsin Highway East. The equipment assigned to this station are one engine, one water tender, one medic unit, and two utility vehicles. The station has a full daytime staff of 2-4 people, including one fulltime medic.
There are various classes performed at the station including CPR and AED. Additionally, the station issues burn permits to residents in the area.

**Eatonville Fire Protection District # 15**

Fire District No. 15 has one station in the plan area (Station 15-2), located at 5403 340th St. E. The station provides other services to the community including burn permit and inspections. The district has a part-time Fire Prevention Educator that works within the district. The station’s equipment consists of one engine, one water tender, and one medic unit.

**Pierce County Fire Protection District # 6**

Fire District No.6 has one station in the plan area (Station 6-4), located at 3431 224th St. E. The equipment assigned to the station is one engine and one medic unit.

**Public Schools**

**Overview of School Related Plans, Policies and Regulations**

The Pierce County Code (PCC), Chapter 41.30 School Impact Fees requires that any school district seeking imposition by the County of an impact fee shall submit a Capital Facilities Plan adopted by the District’s Board of Directors. These plans must be updated regularly to maintain at least a six-year forecast of needs and a six-year plan for funding and include the minimum information required by State law and outlined in PCC, 4A.30.010.

The impact fees are intended to help provide school districts with an appropriate proportionate share of the costs of public school capital facilities needed to serve new growth and development. The impact fees are imposed on new single-family and multifamily dwelling units as part of the County’s building and land use approval process. The impact fees are determined using a fee calculation by each school district, which may not exceed the Maximum Fee Obligation. The impact fee schedule is adjusted annually through an ordinance that is reviewed concurrently with the County’s Capital Facility Plan. PCC, 4A.30.030 includes a School Impact Fee Schedule that outlines the fee calculations and Maximum Fee Obligation for each school district in Pierce County for the years 2005 and 2006.

**School District Facilities Serving the Plan Area**

The plan area is served by Bethel School District #403, Eatonville School District #404, Orting School District #344, and Puyallup School District #3. (See Map F-39: Public Education)

**Bethel School District**

The Bethel School District includes fifteen elementary schools, five junior high schools, three high schools, and one alternative school. The average full time enrollment for this school year is 17,556 students.
EATONVILLE SCHOOL DISTRICT

The Eatonville School District includes three elementary schools, one middle school, and one high school, which serves 10,182 acres of the plan area. The district serves 434 residential dwellings within the plan area. In December 2004 the enrollment was 2,120 with a capacity of 1,795. The district is using portable classrooms to house extra students. No bonds have been passed since 1990 and at this time the district has no plans to modify current structures, with the exception of adding one portable unit at Weyerhaeuser Elementary School.

ORTING SCHOOL DISTRICT

The Orting School District includes two elementary schools, one middle school, one high school, and one K-8 partnership school, which serves 2,422 acres of the plan area. The partnership school is conducted within the Gates Foundation Model School Grant. This school provides an alternative for parents of children in either elementary or middle school. Table F-26 provides a breakdown of the student capacity and the student enrollment for the Orting School District. The capacity for each grade was calculated using the OSPI formula for determining the students per square foot allowance.

At this time, the district has no school construction projects currently underway nor any that are specifically planned. Accordingly, the school district is conducting surveys, community forums, and facility committee meetings to obtain input in an attempt to determine viable options for prospective school construction projects, as well as direction and support for successful bond passage. In the last several years, the school district ran two $19.5 million bonds intended to help pay for a new middle school and extensive upgrades to the existing high school, but it was voted down both times. The biggest challenge for the district is the passage of a bond to generate funding to construct schools on the land owned by the district within city limits.

PUYALLUP SCHOOL DISTRICT

The community plan area contains part of the Puyallup School District. This area (only 138 acres) consists of vacant industrial and commercial lands, fire stations, the Lipoma Golf Course, and one mobile home. In 2005, an application was submitted to develop the Lipoma Firs Golf Course into a Planned Development District (PDD) with a total of 1,697 additional dwelling units, which could accommodate an estimated additional 5,278 people.
PARKS AND RECREATION

OVERVIEW OF CURRENT COUNTY PARK & RECREATION PLANS, POLICIES, AND REGULATIONS

PIERCE COUNTY COMPREHENSIVE PLAN

The Pierce County Comprehensive Plan contains general policies that serve as a guide for future development of regional park and recreation facilities in the areas of the County where a community plan is not in effect. These policies cover a range of issues including responsibility for provision of parks, technical assistance, and location criteria for new parks.

Section 19A.20.090 states that the primary reliance is upon cities and towns and special purpose districts as providers of local facilities and services appropriate to serve those local needs. The location of park and recreation areas is discussed in Section 19A.30.160 which states that new parks must be located on public roads. If a park is located in an urban area, then urban services need to be available. Open space passive recreation parks should be located on land offering significant environmental features. Also addressed in this section are multi-purpose trails, joint venturing, and partnership with others in regional facilities.

Section 19A.30.160 B contains policies on the responsibilities of the County including: limiting taxpayer investment to acquisition; development and maintenance of regional facilities; providing assistance in helping communities identify local park and recreation needs and funding opportunities; and implementing the Capital Facilities Plan element for parks and recreation. Technical assistance for the development, operation and maintenance of local parks and facilities may include technical planning, help in the formation of local recreation service areas, service districts, metropolitan park districts, city/county service area agreements (joint ventures) and self-help agreements with user organizations. The community planning efforts currently underway serve as a mechanism to address community values and needs for local parks and recreation activities.

PIERCE COUNTY COMPREHENSIVE PARK, RECREATION, AND OPEN SPACE PLAN

The Pierce County Comprehensive Park, Recreation, and Open Space Plan (referred to as the Parks Plan) provides general direction and guidance for both facilities and programs. The Parks Plan does not contain site specific plans for each of the County’s properties. These site-specific plans have been prepared, modified, and implemented as needed over the decades. One example of a site specific plan is the development of a new Master Site Plan for Frontier Park.

DESCRIPTION OF PARKS AND RECREATION IN THE PLAN AREA

The Graham community plan area contains only one Pierce County public park, the Frontier park site. There are water access and fishing opportunities provided by Washington State DNR on Lake Kapowsin and other lakes in the area. Also within the plan area is a proposed skate park partially funded by Pierce County second Real-Estate-Excise-Tax monies (2REET). The proposal is found in the Capital Facilities Plan for the County and includes the development of a skate-board/skate park somewhere in the Graham community area. The following was
reported as the current status of the project for the Parks November Capital Projects status report: “The attempts by the Graham Lions/Graham-Kapowsin Community Council/Bethel School District to work out issues regarding ownership, maintenance, liability insurance, etc. are still in progress. We are staying in contact with the stakeholders however; this project still appears to be, under the best of circumstances, a 2005/2006 project.”

<table>
<thead>
<tr>
<th>FUNDING STRATEGIES FOR COMMUNITY AND NEIGHBORHOOD LEVEL PARKS</th>
</tr>
</thead>
</table>

The County is a provider of regional parks and facilities. Local parks, also referred to as neighborhood and community parks, are no longer provided by the County. Existing local parks are currently maintained by the County and available for public use; however, the County is exploring the options for other public agencies to assume stewardship of local parks. At the community plan scale, there are three options available for expanding local parks.

One option would be to form a Park and Recreation District or Metropolitan Park District. State law RCW 36.69 provides the procedure and process for the creation of a Park and Recreation District and its administration. A Park and Recreation District is a special taxing district created by local residents by petition and election. A Park Board is created by election of its members and the Board may put issues such as bond requests on a ballot for consideration by the voters within the district. A Park District is a municipal corporation under State law and is, for the most part independent of the County Council.

Another option is found in RCW 36.68.400, Park and Recreation Service Area. This too is a special purpose taxing authority. This law states that a Park and Recreation Service Area is a quasi-municipal corporation and an independent taxing authority. The service area is created by vote of the people within the service boundary. The members of the County Council act as ex-officio and independently compose the body of the park and recreation service area.

The final option is to expand the current development regulation requirements for dedication of park land in order to create a system of small homeowner maintained “pocket parks.” While this option would provide additional park/open space areas for new developments it would not address the need for local parks to serve existing residents.

</table>

<table>
<thead>
<tr>
<th>OVERVIEW OF CURRENT OPEN SPACE PLANS, POLICIES AND REGULATIONS</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>PIERCE COUNTY COUNTY-WIDE PLANNING POLICIES</th>
</tr>
</thead>
</table>

All jurisdictions within Pierce County participate in the development of the Countywide Planning Policies (CWPPs.). Each jurisdiction’s comprehensive plan needs to be consistent with the policies established in the CWPPs. The Pierce County CWPPs require all jurisdictions to plan for the provision of open space; consider as open space parks, environmentally sensitive lands and greenbelts, natural buffers, scenic and natural amenities unique geological features; designate appropriate open space; and encourage new housing to locate in a compatible fashion with open space designations or outside designated open space.
PIERCE COUNTY COMPREHENSIVE PLAN POLICIES

The Pierce County Comprehensive Plan contains several policies that address open space. These policies establish some general criteria for areas that should be considered for open space. These criteria include areas where natural processes (e.g., wetlands and tidal actions) occur or sites that contain unusual landscape features (e.g., cliffs and bluffs), wooded areas, environmentally unique areas, and parcels which provide connectivity in the open space network.

The open space/greenbelt areas within the County are depicted in the map referenced in policy 19A.30.170.1. Section 19A.30.130, Objective 57A, states County programs which provide for preservation of open space shall have established priorities and these priorities will be used to rate open space proposals for Conservation Futures funding, Open Space Current Use Assessment taxation, Development Regulations bonus densities, and other County programs which acquire or preserve open space areas. Section 19A.30.130, Objective 59B, sets forth policies on the management and stewardship of County-owned open space lands. Finally, 19D.170 identifies the County’s open space priorities grouped under high, medium, and low priorities.

PIERCE COUNTY DEVELOPMENT REGULATIONS

Title 18A, Development Regulations-Zoning, Section 18A.35.025 contains standards for minimum residential amenities which include provisions for on-site open space areas. These standards require the dedication of open space land per dwelling unit for subdivisions and mobile home parks. Section 18A.35.050 addresses open space issues such as density incentives, open space location and designation criteria, permitted uses, classification mechanisms, and public access. Permitted uses within designated open space areas include pervious and impervious surface trails, passive recreation and associated accessory structures, agricultural practices and associated structures, aquaculture, utility easements, and drainfields.

OPEN SPACE PROGRAMS

Different open space programs and development regulations lend themselves to protection and restoration of various designated open space areas. For example, when designated open space areas fall within the jurisdiction of the State’s Shoreline Management Act, the County’s Shoreline Management Use Regulations are in effect. Likewise, when an open space area is located within a designated critical area, which is often the case since the mapping was primarily based upon critical area data, the County’s Critical Area Regulations would apply. Outright purchase and other acquisition efforts, such as obtaining conservation easements, can be applied through the County’s Conservation Futures Program or local land trust efforts. Property owners may choose to leave portions of their properties in an undeveloped condition in return for a reduction in their property taxes under the Current Use Assessment (CUA) program. Pierce County Conservation District Stream Team efforts and those of other local environmental organizations work to enhance and restore degraded riparian areas. Finally, the County’s zoning regulations require a dedication of open space for certain types of
development and certain zoning classifications may be established that require lower densities or intensity of use and the application of environmentally sensitive design standards.

**Current Use Assessment Program**

Since 1972, the County has offered a Current Use Assessment (CUA) program. This program provides property owners with a tax reduction incentive to maintain properties in productive agricultural land, timberland, or open space land condition. At the present time, there are approximately 413 properties enrolled under the open space category of the CUA program.

In the summer of 1999, the administrative procedures for the CUA program were revised and a public benefit rating system (PBRS) was adopted as a means of ranking applications for the CUA open space category. Properties are evaluated to determine what environmental features are present and points are given based upon open space priorities and bonus categories such as public access and property located within an urban area and within the designated open space corridor. The amount of tax reduction is based on a sliding scale of points with the most sensitive lands receiving the highest tax reductions.

**Conservation Futures Program**

The Parks Department also administers the Conservation Futures Program, which since 1991 has authorized the County to collect a real-estate property (6¼ cent per $1,000.00 of assessed valuation) tax for the acquisition of open space properties or conservation easements. To date the County has collected $26,900,000 and acquired 1,245 acres of valuable wildlife habitat and open space properties throughout the County. The properties are not only held by the County but also by the cities and land trusts within the County.

The County Parks Department, utilizing Conservation Futures Program monies, purchased the Muck Creek/Patterson Springs property for $785,000 from the Tacoma Public Utilities in 2002. This is an 80-acre wildlife habitat site generally located near 252nd St. E. and 86th Ave. E. and adjacent to the Morse Wildlife Preserve. This property was transferred over to the Cascade Land Conservancy for long-term stewardship.

**Pierce County Library System**

**Libraries Serving the Plan Area**

The Pierce County Library System is the library provider for the Graham Community Plan area. The system operates one library Graham located at 9202 224th St. E. Additionally, the area is serviced by the Pierce County Bookmobile every first and third Thursday of the month. The Pierce County Bookmobile has four stops in the area: 194th St. E. and Meridian, Graham Elementary, Quiet Village at 255th St. E., and Tibbett’s Landing at 244th St. E. People that live in the plan area also have the option to remotely connect to the Pierce County Library system by logging on to the library catalog system from their home computer.
The library system is focused on the development of the Kids Bookmobile program and is working with the Bethel School District to add more sites in the Graham area to better serve the needs of children.

The Pierce County Library System is currently in the process of reviewing the levies for Pierce County. The library staff is conducting a study to determine if they should remove the 1% levy and replace it with a $.50 per $1,000 of assessed value levy. This would be the statutory limit for library revenue collection. The staff is also aware of the need to conduct a Capital Facilities review; however, no decision on when that review would take place has been determined as of today. The system has two main concerns:

- The Graham Library is one of the most vandalized sites in the system; mainly the shooting out of lights after hours. The staff is concerned because these actions increase the operating cost of the library.
- The speed limit on 224th St. E. is a concern of the library because of the high rate of vehicles speeding.

POWER – ELECTRIC AND NATURAL GAS

The Graham Community Plan is served by three power and electricity utilities:

- Tacoma Power and Light serves the northwest portion of the plan area covering approximately 13,721 acres. The utility boundaries are generally from 194th St. E. to 257th St. E. between Mountain Highway and Meridian Avenue. Tacoma Power is a public owned company that was created in 1893 to serve the needs of the greater Tacoma area.
- Ohop Mutual provides energy to the southwest portion of the plan area covering approximately 10,354 acres. The utility boundaries are generally from 257th St. E. to 352nd St. E. between Mountain Highway and Meridian Avenue.
- Puget Sound Energy serves the entire east portion of the plan area covering approximately 24,875 acres. The utility boundaries are generally from 194th St. E. to 352nd St. E. between Meridian and Orville Road. There are electric system improvement projects under review in the Graham area. PSE’s 10-year plan includes the following:
  - Build a new substation in the vicinity of the Orting-Kapowsin Hwy and 224th St E
  - Build a new substation in the vicinity of 195th Ave E and 264th St E
  - Build a new substation in the vicinity of SR 161 and 200th St E
  - Install new 115 kV facilities along 304th St E/Kapowsin Hwy between SR 7 and Orville Rd E
  - Install new 115 kV facilities between the vicinity of SR 161 and 176th St E and the vicinity of Orville Rd and Kapowsin Hwy
  - Install new 115 kV facilities between the south end of the City of Orting and the vicinity of Orville Rd and Kapowsin Hwy
• Puget Sound Energy is the natural gas provider for the Graham area. There are gas system improvement projects under review in the Graham area. PSE’s 10-year plan includes the following:
  - Install a new district regulator in the vicinity of the SR 161 and 224th St
  - Install a new district regulator in the vicinity of the Orting Kapowsin Hwy and 224th St E
  - Install new High Pressure gas facilities in 224th St E between 22nd Ave E and the Orting-Kapowsin Hwy

OVERVIEW OF CURRENT STORMWATER DOCUMENTS, POLICIES AND REGULATIONS

There are several documents that address stormwater management in the Graham planning area, including the Pierce County Comprehensive Plan, individual basin plans, and non-point pollution watershed plans. The County’s stormwater actions are governed by the National Pollution Discharge Elimination System Permit (NPDES) issued to Pierce County by the Washington Department of Ecology (WDOE). The County’s adopted stormwater management regulations are required to be consistent with the requirements outlined in the WDOE Stormwater Management Manual for Western Washington.

STORM DRAINAGE AND SURFACE WATER MANAGEMENT PLAN

The Pierce County Storm Drainage and Surface Water Management Plan (1991 Plan) was adopted in 1991 and is part of the Pierce County Comprehensive Plan. The 1991 Plan established a system for managing stormwater within individual drainage basins.

The stormwater management program is administered by the Water Programs Division of Public Works and Utilities (Water Programs). Water Programs is home to the County Storm Drainage and Surface Water Management Utility (SWM). SWM develops annual and 6-year capital improvement programs containing a list of surface water management projects utilizing the 1991 Plan and supplemental information.

The program is supported by stormwater management fees collected within each basin. The current fee structure is based upon the need for storm and surface water management activity within each basin.

BASIN PLANS

In recent years Water Programs has begun updating the 1991 Plan by preparing plans for the individual drainage basins. The Graham Community Plan area is within five of those drainage basins: Clover Creek, Muck Creek, Nisqually, Mid-Puyallup and Upper Puyallup. Water Programs is developing storm drainage and surface water management plans that are specific to each of those basins. The Clover Creek, Muck Creek, and Mid-Puyallup plans have been completed and adopted by the Pierce County Council. The Nisqually and Upper Puyallup Plans...
will be completed within the next three years. They are in the preliminary stage of development.

The plans contain information used to determine future capital improvement expenditures for projects and programs within each basin. Those expenditures are included within the County Capital Improvement Plan that is reviewed on an annual basis by the Pierce County Council.

The proposed projects and programs were developed after a comprehensive review of existing surface water related issues within each basin. They are intended to address flooding, water quality and riparian habitat problems within the basins. Proposed projects and programs include such solutions as construction of stormwater facilities, restoration of floodplain and riparian areas, acquisition of floodplain areas, studies to determine solutions to specific problems, and Countywide programs such as improved public education and outreach activities and development of a comprehensive monitoring program.

**Nonpoint Pollution Plans**

Pierce County has prepared the Chambers-Clover Creek Watershed Action Plan and the Lower Puyallup Watershed Action Plan and the Upper Puyallup Watershed Action Plan through a concurrency process with multiple stakeholders, including the public. These are documents that contain several recommendations for reduction of sources for non-point source pollution within the basins and are implemented by multiple stakeholders. Implementation of the plans is overseen by individual Watershed Councils representing the two WRIAs (Water Resource Inventory Areas), the Chambers-Clover Creek WRIA and the Puyallup WRIA.

**National Pollution Discharge Elimination System (NPDES) Permit and Stormwater Regulations**

In July 1995, Pierce County was issued a National Pollutant Discharge Elimination System (NPDES) permit from the Washington State Department of Ecology. This permit regulates both the quality and quantity of stormwater in new development as well as existing structures. This permit, rooted in the federal Clean Water Act, is a major factor in the County’s stormwater and surface water management program.

To implement the NPDES permit, Pierce County has adopted the following local regulations and guidance documents:

- Stormwater Management & Site Development Manual – Provides guidance on reducing stormwater flows and erosion from new construction.
- Best Management Practices Manual – Provides guidance on ways in which existing businesses and residences can reduce or prevent pollution.
- Illicit Discharge Ordinance – Makes it illegal for any business or individual to cause Pierce County to violate its permit. It includes an inspection program.

Stormwater improvement projects are subject to review by numerous agencies. Permits and reviews that may be required include hydraulic project approvals from Washington State Department of Fish and Wildlife, Water Quality Certification from Washington State Department of Ecology, Stormwater Permit from Washington State Department of Ecology, Corps of Engineers review for Nationwide or Individual Permits under the Clean Water Act,
Endangered Species Review, County Wetland and Critical Review, State Environmental Policy Act review, Shoreline Permit Review and Department of Natural Resources review for discharges to state-owned lands.

**Level of Service Standards for Stormwater Facilities**

Surface Water Management levels of service (LOS) are established in the Pierce County Capital Facilities Plan (CFP). In general, sizing of all major ponds and conveyance systems is for the 100-year storm, given future build-out based on current zoning. Ponds are sized using both 24-hour events and 7-day events, whichever is larger. All infiltration facilities have water quality features to protect groundwater quality. Detention ponds usually include designed water quality features, typically to reduce maintenance costs or to protect in-pond wetland features.

The County must frequently correct problems within developed areas that have occurred because existing systems are inadequate to handle surface water flows. In these instances, the County is not always able to fully achieve the prescribed level of service with its new facilities because sufficient land is not available, or because reconstruction of an entire system is not cost efficient. In these cases the projects that are developed are designed and constructed in a manner that best meets the needs of the area. Sometimes multiple solutions must be utilized, such as both the construction of stormwater facilities and purchases of flood prone properties within an area. The Comprehensive Plan favors the use of nonstructural methods for surface water management (i.e., protection of water resources from development impacts instead of constructing facilities such as pipelines and ponds).

**Existing Stormwater Management Structures and Facilities within the Plan Area**

County GIS mapping shows that the Water Programs Division of Public Work and Utilities owns and maintains 15 stormwater facilities within the plan area. According to a review of public and private facilities using Pierce County GIS data, there are approximately 100 miles of drain pipe (36 miles of public pipe), approximately 2000 catch basins (1000 public catch basins), approximately 470 dry wells (270 public), and 236 miles of ditches (160 public) within the plan area. Catch basins, pipes, and dry wells are concentrated in the northern area where there is more development. The County is responsible for maintenance of facilities within County right-of-way.

**Stormwater and Surface Water Management Activities Proposed within the Plan Area**

During development of the proposed Clover Creek, Mid-Puyallup, and Muck Creek Basin Plans stormwater and surface water management issues were identified and evaluated within the Graham area. Water Programs staff and consultants reviewed documented surface water data and storm drainage concerns, solicited citizen input and conducted field evaluations to identify problems and potential projects. In several cases projects were revised or added as the result of citizen concerns. The same processes will be used to identify issues within the Upper Puyallup and Nisqually Basin Plan areas.
The northeast corner of the Graham plan area lies in the Horsehaven Creek drainage area of the Mid-Puyallup Basin. Sediment-laden stormwater from new construction and from the erosive force of peak stormwater volumes during storms has severely damaged Horsehaven Creek. Stormwater is undermining Jansky Road and the Mid-Puyallup Basin Plan recommends a channel stabilization project. Streamside residents and County staff report deep sediment deposits in the Puyallup River valley. Restoration and conservation of the riparian corridor in the valley and the replacement of two culverts that are barriers to fish passage have been identified as needs in the area.

The northwestern portion of the plan area lies within the Spanaway Creek and Upper Clover Creek sub-basins of the Clover Creek Basin. Groundwater flooding is a problem near the northern boundary of the plan area. Recommended solutions to the problem include acquisition of impacted properties, re-evaluation of existing stormwater conveyance systems, construction of infiltration facilities downstream of the problem area, blocking culverts, and flood-proofing residences.

Most of the community plan area lies within the Muck Creek Basin. Some flooding problems have been identified throughout the Basin. Most involve localized ponding due to topographic depressions or undersized culverts and ditches. Many involve maintenance of existing facilities to remove blockages. Flooding is generally problematic only during larger storm events. The rural densities throughout most of the planning area and regulatory constraints against development within floodplains and within wetland buffers aid in the mitigation of flooding impacts.

There has been a flooding problem around 224th St. E. and Meridian caused by runoff from roads and development. The soils in that location are such that stormwater could be infiltrated. In 2004, Water Programs initiated a groundwater monitoring study to determine the connectivity of groundwater in this area to that within the Clover Creek Basin. The results of that study will influence the type and/or location of a County solution to the problem. The study is anticipated to be completed in 2006.

In addition to construction of stormwater facilities in the plan area, Water Programs has proposed the acquisition of riparian areas that are sensitive to surface water impacts. The properties have been identified on the basis of the presence of floodplains, wetlands, and stream corridors. Protection, and if necessary, restoration of these properties would ensure that floodplain capacity is not compromised, that erosion and sedimentation would not contribute to downstream interruption of stream flow or water quality. The Patterson Springs area is of particular interest, because the headwaters of the North Fork of Muck Creek originate there. The springs appear to be the source of year-round flow in the North Fork. The South Fork of Muck Creek tends to be dry much of the year. Protection of adjoining flood plains and wetlands along areas of the South Fork could ensure that ground and surface water are
naturally held and released at a rate that reduces the potential for flash flooding and associated erosion and sedimentation along the creek during large storm events.

SOLID WASTE AND RECYCLING

OVERVIEW OF CURRENT SOLID WASTE AND RECYCLING PLANS, POLICIES AND REGULATIONS

COMPREHENSIVE PLANS

The County updated the Tacoma-Pierce County Solid Waste Management Plan in 2000. It was adopted by the cities and towns and approved by the Washington Department of Ecology in 2001. The Pierce County Solid Waste Advisory Committee (SWAC) participated in the development of all policies and activities for the recycling, waste reduction, and illegal dumping programs, and continues to meet regularly to review programs and gather citizen input. All meetings are advertised and are open to the public.

SOLID WASTE PLAN POLICIES AND GUIDELINES

The Year 2000 Solid Waste Plan carried forward many of the goals, policies and program priorities first established in 1989. For the most part, the many new recommendations are about enhancing and expanding those recycling programs that have been successful and redirecting efforts to incorporate new solutions. They also look at ways to continue and improve services that support the long-term cooperative system developed between the County, cities and towns, and the private haulers and recyclers.

The main new recycling policy directed the County to review the residential curbside program to explore ways to add other recyclables and revise the bin system to keep participation rates high. After a public review, the County adopted new minimum levels of service for curbside recycling (Pierce County Code, Chapter 8.29) which directed the haulers to collect commingled recyclables in a single, wheeled 96-gallon cart and to offer the same program to their contract cities and towns. Other recycling policy directions include: expanding the public outreach and educational programs; developing new outreach programs for businesses and self-haulers; providing adequate funding to support the programs; and increasing diversion and recycling of foodwaste and compostable organics.

There were no major changes to disposal policies. They continue to provide for both in-county and out-of-county disposal options and direct disposal companies to reserve in-county Municipal Solid Waste (MSW) disposal capacity for Pierce County waste, to the extent allowed by law. The County contracts for disposal and operation of the County’s transfer stations with Pierce County Recycling, Composting & Disposal LLC doing business as (dba) LRI.

One new policy directs the County to investigate patterns of usage, future needs, and ownership options for the County-owned facilities, such as the transfer stations and the yardwaste composting facility. This study is scheduled to complete its first phases in 2006.

New plan policies significantly expanded the direction to all agencies to identify illegal dumping and junk vehicle problems; to remove legal barriers; to develop coordinated prevention and
enforcement programs; and to find ways to finance cleanup efforts. These policies resulted in the Solid Waste Division’s development of the Pierce County Responds Program in 2002 and the adoption in 2003 of Chapter 8.10 of the Pierce County Code to resolve public nuisance vehicle problems.

SOLID WASTE AND RECYCLING SERVICES AND FACILITIES IN THE PLAN AREA

**COLLECTION SERVICES**

Curbside pickup of garbage and recyclables is available to all households and businesses within the plan area. Service is provided by two solid waste collection companies under the franchise authority of the Washington Utilities and Transportation Commission (WUTC). Pierce County Refuse, a subsidiary of Harold LeMay Enterprises, serves all areas west of Meridian (SR 161) and all areas south of 304th St. E. Murrey’s Disposal, a subsidiary of Waste Connections, Inc., serves all areas east of Meridian and south to 304th St. E.

Both companies offer a variety of levels of garbage service for single-family and multifamily households, condominiums, mobile home parks, and commercial/industrial businesses. Yardwaste collection is also available to most developed residential neighborhoods.

For recycling collection, residential households are provided with a 96-gallon recycling cart to recycle newspaper, cardboard, mixed-waste paper, magazines; plastic pop, milk, and water bottles; paper milk cartons; and all tin, steel, or aluminum cans. The hauling companies sponsor a number of drop-off collection sites for glass and also offer recycling collection services to commercial businesses.

**FACILITIES AND SELF-HAUL OPPORTUNITIES**

Only route collection and commercial waste vehicles are allowed to take waste to the LRI Landfill located at 304th St. E. and Meridian within the Graham area. It is a privately-owned landfill operated by Pierce County Recycling, Composting & Disposal, LLC dba LRI. The County contracts with LRI for disposal of municipal solid waste.

Residents can self-haul their garbage, yardwaste, or recyclables to the Hidden Valley Transfer Station, located just north of Graham at 176th St. E. and Meridian at the site of the closed Hidden Valley Landfill. Recycling drop-off is free but there is a fee for garbage and yardwaste. Yardwaste is accepted at a reduced rate and is composted and turned into a valuable soil amendment or mulch at the LRI Compost Factory located at Hidden Valley.

Questions about where to take other items for disposal or recycling can be directed to the Pierce County Public Works and Utilities Department, Solid Waste Division. The Division maintains a current list of the many private and public facilities handling waste and recyclables and provides a full range of public outreach, school education programs, and publications about waste and recycling or composting. The Division sometimes sponsors special collection events for hard-to-recycle items. The latest information can be found at: www.piercecountywa.org/recycle.
HOUSEHOLD HAZARDOUS WASTE

Used motor oil and anti-freeze can also be taken to the Hidden Valley Transfer Station. All other household hazardous wastes, such as oil-based paints, pesticides, herbicides, solvents, or cleaners can be taken free-of-charge to the City of Tacoma’s Household Hazardous Waste Facility located at the Tacoma Landfill. The Tacoma-Pierce County Health Department maintains a Hazardous Waste Hotline to answer questions about proper disposal of hazardous waste and works with an assortment of gas stations and auto-parts stores to sponsor drop-off sites for used motor oil.

ILLEGAL DUMPING & JUNK VEHICLES

Pierce County Responds is the County’s program to provide a comprehensive response to the problem of illegal dumping of waste and nuisance vehicles. The Solid Waste Division maintains a hotline to receive and investigate illegal dumping and nuisance vehicle complaints. Within the authority of this program, the County offers a cooperative abatement system to assist with cleanup of waste and vehicle removal, recommends cases for prosecution, effects site cleanups, and promotes citizen involvement in litter cleanup activities. The program brings together the staff and resources from the departments of Public Works and Utilities, Planning and Land Services, Community Services, Sheriff, Prosecuting Attorney and the Tacoma-Pierce County Health Department. Information about the program can be found at: www.piercecountyresponds.org.

LEVEL OF SERVICE STANDARDS

Solely for the purposes of projecting long-term disposal needs, the County uses a Level of Service (LOS) standard of 4.5 lbs per capita per day for disposal and 4.5 lbs per capita per day for recycling (50% recycling rate). The County is required to plan for 20 years of disposal capacity and contracts for disposal of municipal solid waste at the LRI Landfill. The contract also allows for long-haul of waste out-of-county.

PROPOSED SOLID WASTE AND RECYCLING SERVICE AND FACILITIES FOR THE PLAN AREA

In 2005, a full-service, year-around household hazardous waste collection facility was built at the Hidden Valley Transfer Station at 176th St. E. and Meridian (SR 161). Residents will be able to drop-off all household hazardous wastes free-of-charge. Hazardous waste from commercial or industrial businesses must be taken to permitted private facilities.

DESCRIPTION OF DESIRED CONDITIONS

DOMESTIC WATER

Ensuring adequate and good quality groundwater supplies to provide healthy drinking water is a very high priority to the community. Conservation efforts should be made to ensure that water purveyors do not run low or dry in summer months. If necessary, new interties should be established to provide adequate water supplies and Pierce County should proceed with
becoming a wholesale water supplier to existing Class A water purveyors. Class A water purveyors should also work with Class B systems or individuals to acquire currently underutilized water. As new development proposals are submitted, Letters of Water Availability should be required that demonstrate which water right is being used and how much water is available in order to track cumulative impacts to the groundwater source.

**TRANSPORTATION**

The Transportation Section provides a foundation for the improvement of transportation facilities in the plan area. The policies, along with the prioritized project recommendations, provide guidance on the type and location of improvements that should be pursued over the next twenty years.

A number of themes are contained in the plan policies and project recommendations. The transportation system within the plan area should be designed to accommodate increased commuter traffic volumes as well as recreational/tourist related trips while still exhibiting a rural character. Roadways should include shoulders or sidewalks that allow for safe pedestrian and bicycle movement or alternatively, nonmotorized trail systems should be provided. These systems should connect residential areas with commercial nodes. When possible, streets should be oriented in such a manner as to take advantage of scenic views and vistas. A program should be undertaken to improve traffic flow, safety, and access. Future roadways should be sited to maintain existing neighborhoods, protect vital environmental features, and facilitate emergency vehicle access.

Transit routes should be added and frequency increased as the population increases. Bus stops and shelters should be integrated into the streetscape, especially in the more urban portions of the plan area. Development of the “Train to the Mountain” should occur and the opportunity for a train stop within the Graham Rural Activity Center (RAC) at 224th St. E. and Meridian should be examined.

**PRIORITIZATION OF TRANSPORTATION PROJECTS**

Future transportation improvements should be completed based upon a prioritization of projects considering existing safety issues, community needs and desires, and costs. Most of these improvements were previously identified in the Pierce County Comprehensive Plan; however, several new projects have been listed to address community concerns. The most notable additions to the project recommendations may be those within the Graham RAC. A set of north-south and east-west roads is proposed within the Graham RAC that would allow vehicles to circulate around the commercial area without having to use SR 161 and 224th St. E. A few of the Comprehensive Plan projects were removed or modified, as well. See Appendix A for Prioritized Transportation Project Recommendations and two maps titled “Transportation Project Recommendations” for the description and location of the recommendations. The two maps portray identical information, but one includes the whole plan area and the other is a close-up of the Rural Activity Center vicinity. The CPB prioritized each project into one of four priority categories of relative importance: Premier, High, Medium, and Low. This prioritization scheme was originally developed for the 1992 Transportation Plan and has been used in all
community plans. The rating of each project is one of the items used to guide the programming and construction of roadway improvements.

**LAW ENFORCEMENT AND FIRE PROTECTION**

Law enforcement and fire protection services are necessary in rural areas as well as urban areas. Service personal and facilities should be available to meet the needs of the population and established national response time standards. And these services should be proportionally increased in pace with population increases. Law enforcement agencies should consider co-locating police precincts with fire stations or other public facilities such as libraries.

**PUBLIC SCHOOLS**

Pierce County collects impact fees to help mitigate the impacts of new development on the school district personnel and facilities. These impact fees should be significantly increased to help offset the actual cost of increased service.

**PARKS AND RECREATION**

**REGIONAL PARKS**

New regional parks should be located near physical amenities such as lakes, creeks, wetland, forested areas, and historical and scenic areas and when possible, provide access to shorelines. These parks should be at least 40 acres in size and provide a range of both passive and active recreation activities. Some priority areas for future park acquisition include Lake Kapowsin, Whitman Lake boat ramp, and Lake Tanwax boat ramp.

The citizens of the plan area should have an opportunity for community involvement in the siting and developing of regional parks and the Pierce County Parks and Recreation Services Department should provide adequate notice of any such upcoming opportunities. Each regional park should have a development site plan that identifies passive and/or active recreation areas, buildings or other structures, open spaces, and intended uses. These park facilities may charge user fees to generate funds for ongoing maintenance and operation of the facility.

**NEIGHBORHOOD AND COMMUNITY PARKS**

A local Park Service Area, Park District, or Metropolitan Park District should be created to help fund and develop neighborhood and community parks. Local citizens and organizations should work together with the Pierce County Parks and Recreation Services Department to determine the feasibility of creating and financing a local park service area or district. If this is favorable to the larger community, then Pierce County Parks and Recreation Services Department should assist the community in bringing this issue to a future general election for a vote by the affected citizens. The Parks and Recreation Services Department should also help the Park Service Area,
Park District, or Metropolitan Park District with preparing grants for property acquisition, operation and maintenance for neighborhood and community parks.

Pierce County should assist the Park Service Area, Park District, or Metropolitan Park District in requiring an impact fee, land dedication or fee-in-lieu-of dedication for neighborhood and community parks. All new residential subdivisions and multifamily residential developments should be required to contribute towards the acquisition and development of neighborhood and community parks in accordance with standards outlined in the community plan. If a Park Service Area or Park District is created, then County collected park impact fees should be transferred to that entity to be used for the acquisition and development of community and neighborhood parks. In addition, Pierce County shall develop regulations that identify the location, use, improvement and maintenance of land dedicated for community and neighborhood parks.

New neighborhood and community parks should be located and designed to serve the needs of all segments of the community and provide for both passive and active recreational areas. Community parks should typically be between 15 to 25 acres in size, accessed from an arterial road and provide restroom facilities. Neighborhood parks should generally be 5 to 10 acres in size but may be smaller when located within private residential developments. These smaller scale parks should be evenly dispersed throughout the plan area and easily accessed by walking or bicycling from residential areas. Whenever feasible, neighborhood parks should be developed adjacent to school sites to promote facility sharing and provide amenities lacking at school grounds such as trails, open space, picnic areas, and playground equipment.

**Partnerships**

Pierce County, school districts and any created Park Service Area or Park District should work cooperatively to provide and improve park and recreational facilities and programming within the plan area. These types of partnerships could include program coordination and cost-sharing for construction, improvement and maintenance of joint-use facilities. One example of this concept is co-locating community recreational activities within schools.

**Park Site Acquisition**

Vacant land should be acquired now for future development of parks. Some of these acquisitions should also serve to expand existing parks. Several areas have been identified as high priority for acquisition including Lincoln Tree Farm, areas along Muck and South Creeks, places on the Puyallup River, Pierce County Elk Plain Road Shop property, north end of Kapowsin Lake, and expansion of Morse Preserve, Cougar Mountain Park, and Frontier Park. A complete listing of all identified areas is located in the plan policies. These priorities should be balanced with the need to expend revenue to develop existing vacant or underdeveloped park properties and the acquisition of other properties, not on the list, that become available as a good opportunity and/or cost. (See Map F-40: Park, Recreation, and Trail Facilities (Proposed and Existing))
TRAILS

A community-wide system of trails should be developed that link schools, neighborhoods, unique environmental features and other points of interest. The trail systems should be multi-modal and provide for walking, bicycling, and horseback riding. The trails within the plan area should connect to other regional trail systems (identified by Pierce County or the Forever Green Council) within the County or when possible with trails identified in other community plans. These trails should also be located and designed to enhance user safety, avoid or mitigate environmental impacts and be aesthetically pleasing for the user. High priority areas for new trails include around Lake Kapowsin and within Frontier Park and other parks. Developers should be required to dedicate regional trails during the subdivision and site development processes. And unopened rights-of-way and other public lands should be considered for trail systems. When possible, trail acquisition and development should be coordinated with the Pierce County Transportation Plan.

EXISTING PARKS AND RECREATION PROGRAMS

Existing parks and recreation facilities and programs should be maintained and renovated in accordance with the master park plan process. These improvements should serve to enhance programs and facilities within the plan area.

PIERCE COUNTY LIBRARY SYSTEM

Safety and security should be improved around the Graham Library. A study should be conducted to determine the feasibility of lowering the speed limit to 35 miles per hour or implementing other means to reduce speeds on 224th St. E. between 82nd Ave. and Meridian. Pierce County should consider co-locating a police substation at the library property to help reduce vandalism.

STORMWATER FACILITIES

Stormwater facilities serving the plan area should be functional, environmentally sound, and as aesthetically pleasing as practicable. These facilities should be designed to mitigate existing stormwater problems and to blend in with and mimic natural systems, such as wetlands. When possible, stormwater facilities should provide passive recreational opportunities and aquifer recharge functions. The County Council should adopt the watershed basin plans which identify necessary stormwater management and flood control improvements.

SOLID WASTE

Solid waste facilities are a necessary component of modern life. However, inappropriate siting or development of these facilities may cause environmental impacts to groundwater supplies, which may also result in problems to the public’s health. As such, new or expansions of existing solid waste facilities should be located and developed in a manner that protects the natural environment and the surrounding population. At a minimum, federal, state, and local criteria
shall be adhered to. In addition, solid waste facilities should not be located closer than five miles to any Shoreline of the State nor within one mile of any tributary to such waters or within a designated floodplain. Development of facilities shall not involve the filling of any wetlands, unless no other practicable alternative exists and then only with adequate mitigation conducted within the watershed resource inventory area. These facilities should not be located over a sole source aquifer, as defined by the federal or state government or in areas that have a high preponderance of outwash materials (such as sand and gravel) that have high infiltration capacity. Any proposed sites for a solid waste facility should be evaluated through independent studies to determine geologic and hydrogeologic conditions.

Local approval of solid waste facilities should contain requirements for ongoing monitoring and corrective actions for any contamination or other problems that may occur. A rigorous monitoring regime should be established to evaluate the status and quality of the underground water tables, water pressure, and ground fractures. A remediation plan should detail measures to be initiated if groundwater contained within the aquifer or surface water is contaminated.

The Tacoma-Pierce County Health Department should provide information to the public on the status of existing solid waste facilities within the plan area. An annual written report detailing the monitoring and testing results should be provided to the water purveyors and landowners within a ten-mile radius of the facility and posted on the internet and in all local newspapers for general public access.

**CAPITAL FACILITIES POLICIES**

**LAW ENFORCEMENT AND FIRE PROTECTION**

**GOAL GR CF-1**  Provide adequate law enforcement and fire protection services and response times within the plan area.

- **GR CF-1.1**  Reduce law enforcement response times and increase police presence by locating a new police precinct in the plan area.
- **GR CF-1.2**  Consider co-locating a precinct with fire stations and the Graham Library property.
- **GR CF-1.3**  Consider the 304th St. E. and Meridian Rural Activity Center as a potential location for a new precinct.
- **GR CF-1.4**  Encourage Fire Districts to pursue impact fees to help defray the costs associated with serving new development.

**LIBRARY SYSTEM**

**GOAL GR CF-2**  Improve safety and security around the Graham Library.

- **GR CF-2.1**  Consider reducing the speed limit on 224th St. E. from 82nd Ave. to Meridian to 35 mph.
GR CF-2.2  Pierce County should initiate an engineering study to determine the feasibility of reducing the speed limit to 35 miles per hour or implementing other means to slow traffic.

GR CF-2.3  Co-locate a police substation at the library property to help reduce vandalism.

### PARKS AND RECREATION POLICIES

#### GOALS

Provide regional, community, and neighborhood parks and recreational facilities to meet the needs of the existing and future population to serve the County and plan area.

#### REGIONAL PARKS

**GOAL GR PR-1**  Achieve and sustain an acceptable level of service for regional park facilities.

**GR PR-1.1**  New regional parks within the Graham Community Plan area should be designed and located to serve the needs of community residents as well as providing countywide benefits. New regional parks should meet the following criteria:

**GR PR-1.1.1**  Park sites should be located to take advantage of the physical amenities in the plan area with attention to access points to waterbodies and watercourses. Priorities include lakes, creeks, wetlands, forested areas, steep slopes, and historical and scenic areas.

**GR PR-1.1.2**  Regional parks should generally be 40 acres or more in size; however, these parks may be developed on smaller parcels based upon land availability, facility type, community need, site characteristics, and other factors. All sites that provide public access to waterbodies and watercourses in the Graham Community Plan area are regional sites.

**GR PR-1.2**  The following are high priority sites for regional park land acquisition within the Graham Community Plan area. The sites are not listed in any order of preference or importance.

**GR PR-1.2.1**  Lake Kapowsin;

**GR PR-1.2.2**  Whitman Lake boat ramp;

**GR PR-1.2.3**  Lake Tanwax boat ramp; and

**GR PR-1.2.4**  Other properties as identified on the proposed parks and trails map for Graham.

**GR PR-1.3**  The Council District 1 and 3 representatives on the Pierce County Parks Citizens Advisory Board should be provided with all necessary information to help inform civic and community groups and local governmental agencies about the plans and operations of the County regarding regional park location and development.
The Pierce County Parks and Recreation Department should actively encourage joint development among civic and community groups and local governmental agencies of regional park sites that include a local park component.

Development of facilities at a regional park should not occur prior to completion of the necessary site plan.

Where appropriate, develop park facilities that generate funds and incorporate revenue collection into the design.

When considering charging user fees at sites that provide recreational opportunities, establish an appropriate rate that will help support the maintenance and operation of these facilities.

**Neighborhood and Community Parks**

**GOAL GR-2** Pierce County shall support the creation of a park service area, park district, or metropolitan park district to help fund and develop community and neighborhood-scale parks throughout the plan area.

**GR-2.1** Identify local organizations interested in the improvement of park and recreational opportunities within the community and provide the initial technical and financial assistance necessary to form a park service area or district.

**GR-2.1.1** The Pierce County Parks and Recreation Department should conduct a series of education workshops regarding the formation, financing, and management of park service areas and districts.

**GR-2.1.2** The Pierce County Parks and Recreation Department should assist the community to identify sponsor(s) willing to lead in efforts to form the park service area or district.

**GR-2.1.3** Upon generating sufficient public interest in the formation of a park service area or district, Pierce County shall bring the issue to a vote of the citizens at the following general election.

**GR-2.1.4** Pierce County Parks and Recreation Department shall provide park and recreation providers technical expertise in site planning and facility needs assessments.

**GR-2.1.5** Pierce County Parks and Recreation Department shall provide assistance in the preparation of grants for property acquisition, operation, and maintenance.

**GR-2.2** Pierce County should require an impact fee, land dedication, or fee in lieu of dedication for community and neighborhood-scale parks based upon the standards of the Community Park Facilities Standards and Neighborhood Park Facilities Standards.
GR PR-2.2.1  Pierce County should require all new residential subdivisions and multifamily residential developments to pay an impact fee, dedicate land, or pay a fee in lieu of land dedication for the development of community and neighborhood parks. The structure of each of these options shall be correlated to the standards set forth.

GR PR-2.2.2  When a park service area or park district is created, it shall consider the collection of park impact fees as a means of providing funds for community and neighborhood parks.

GR PR-2.2.3  Pierce County shall develop regulations controlling the location, use, and improvement of land dedicated for community and neighborhood park purposes. Such regulations shall prescribe minimum park dedication areas, access, amenities, location, and maintenance.

GR PR-2.3  Land that is suitable for future neighborhood and community park and recreation facilities should be purchased or acquired by the park and recreation provider in the most effective method available. Park and recreation providers should implement innovative methods of financing land acquisition, facility development, and long-term maintenance and operating costs for all park and recreation facilities. Provide opportunities for community control of local parks.

GR PR-2.3.1  All suitable County-owned properties that are being considered for divestment should first be evaluated as potential park sites.

GR PR-2.4  Establish standards for community and neighborhood park and recreation facilities.

GR PR-2.4.1  Utilize the following standards for community parks within the plan area:

<table>
<thead>
<tr>
<th>Table F-27: Graham Community Park Facilities Standards</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Facility</strong></td>
</tr>
<tr>
<td>-----------------------</td>
</tr>
<tr>
<td>Community park land</td>
</tr>
<tr>
<td>Fields for softball and youth baseball for soccer, football, or pickup games</td>
</tr>
<tr>
<td>Multi-use outdoor paved courts (tennis, basketball)</td>
</tr>
<tr>
<td>Tennis court</td>
</tr>
<tr>
<td>Children's play area</td>
</tr>
<tr>
<td>Picnic area</td>
</tr>
<tr>
<td>Trails or pathways (minor)</td>
</tr>
<tr>
<td>Restrooms</td>
</tr>
<tr>
<td>Parking</td>
</tr>
</tbody>
</table>

GR PR-2.4.2  Utilize the following standards for neighborhood parks within the plan area:
Table F-28: Graham Neighborhood Park Facilities Standards

<table>
<thead>
<tr>
<th>Facility</th>
<th>Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Neighborhood park land</td>
<td>3.0 acres per 1,000 population</td>
</tr>
<tr>
<td>Multi-use paved games court (1/2 court)</td>
<td>0.3 courts per 1,000 population</td>
</tr>
<tr>
<td>Children’s play area</td>
<td>0.2 play areas per 1,000 population</td>
</tr>
</tbody>
</table>

**GR PR-2.5**  
New community and neighborhood parks within the plan area should be designed and located to serve the needs of all segments of the community.

**GR PR-2.5.1**  
New park sites should be located to take advantage of the physical amenities within the plan area. Priorities include wetlands, forested areas, steep slopes, historical areas, scenic areas, and other natural features.

**GR PR-2.5.2**  
The size of a community park is typically 15 to 25 acres. Access to a community park should be from an arterial street if traffic volumes are anticipated to be high, and parking shall be dependent upon the facilities provided. Restroom facilities should be provided at a community park.

**GR PR-2.5.3**  
Ideally, a neighborhood park should be 5 to 10 acres in size. However, these parks may be considerably smaller when located within a private development. Neighborhood parks should be separated from one another in a relatively even manner throughout the plan area. Typically, a one to two-mile separation is desirable. Neighborhood parks should be reasonably central to the neighborhood they are intended to serve. Access to a neighborhood park should be via a local residential street. Walking and bicycle access routes should avoid physical barriers such as major arterial roads or stream crossings whenever possible. Parking or restroom facilities are typically not provided at a neighborhood park.

**GR PR-2.5.4**  
Neighborhood parks should be developed adjacent to school sites whenever possible to promote facility sharing. Facilities at the neighborhood park site should supplement uses that the school does not provide such as trails, open space, picnic areas, playground equipment, and multi-purpose hard-surfaced courts.

**PARTNERSHIPS**

**GOAL GR PR-3**  
Pierce County Parks and Recreation Department and Pierce County Public Works and Utilities – Transportation Programming Division should coordinate transportation planning with the Frontier Park Master Site Plan process.

**PARK SITE ACQUISITION**

**GOAL GR PR-4**  
Acquire selected parcels of land for future development of park and recreational facilities.
GR PR-4.1 Focus on park site acquisitions that serve to expand existing facilities.

GR PR-4.2 Expand the Graham community passive and active recreation opportunities at Frontier Park to include walking trails and road-crossing striping.

GR PR-4.3 Purchase additional land throughout the plan area for future development of park facilities. High priority areas for future park acquisition include:

- **GR PR-4.3.1** Lincoln Tree Farm east of Mountain Hwy., north of 288th St. E.;
- **GR PR-4.3.2** Other designated locations along Muck and South creeks;
- **GR PR-4.3.3** Puyallup River and other water bodies;
- **GR PR-4.3.4** Pierce County Elk Plain Road Shop property with dedicated trail to Bethel High School;
- **GR PR-4.3.5** A 25-acre undeveloped parcel located at 46th Ave. E. and 232nd St. E.;
- **GR PR-4.3.6** Cougar Mountain Park (could have prairie, passive/active recreation) on 26th St. E., east of 54th Ave. E.; also, K-12 school on 26th St. E. west of 54th Ave. E.;
- **GR PR-4.3.7** Possible community passive nature trail adjacent to the Morse Wildlife Preserve at 260th St. E. and 70th Ave. E.; also, expand the area included in the Morse Wildlife Preserve;
- **GR PR-4.3.8** Bonneville power line, in the trail system, extending across the plan area, from Mountain Hwy., and 288th St. E. to Orville Rd. south of Orting;
- **GR PR-4.3.9** Scenic overlook on Meridian at the top of Graham Hill;
- **GR PR-4.3.10** Possible expansion of Frontier Park on south side for trails;
- **GR PR-4.3.11** Puyallup River trail park; and
- **GR PR-4.3.12** A joint Pierce County/state park at the north end of Lake Kapowsin.

**TRAILS**

**GOAL GR-5** Where appropriate, trails should link destinations, provide for all user groups, and serve a regional scale.

**GR-5.1** The trail system should extend through the plan area and connect with the County’s regional trail system in the Orting Valley. (See proposed park and trails map).

**GR-5.2** The trail system should reflect the trail corridors included in the ForeverGreen Council’s recommendations regarding regional and countywide trail connections spanning from the Cascade Mountains to Puget Sound.

**GR-5.3** Trails should be designed to interconnect or form loops whenever possible.

**GR-5.3.1** Trails should not dead end unless unique circumstances exist such as a trail that provides access to a specific destination.
When a proposed development is adjacent to vacant property, trails should be designed to accommodate future expansion at such time the adjacent property is developed.

Purchase additional land throughout the plan area for future development of trail facilities. High priority areas for future trail acquisition and development include:

- Around Lake Kapowsin;
- Trails within Frontier Park; and
- Trails within other parks.

Require the dedication of regional trails during the site development process.

Designated trails should be considered for each subdivision and site plan approval.

When a site is located along a proposed trail route, a linear section of land shall be dedicated and developed as a condition of approval. Such portion of land shall be credited toward any required park land dedication.

When a site is not located along a proposed trail route, then a fee in lieu of land dedication shall be required to contribute toward the regional trail system.

Extend existing trail/sidewalk areas before starting on undeveloped areas (i.e., complete in segments).

Consider dedicating unopened rights-of-way and other public lands for trail purposes.

Require the installation of nonmotorized transportation trails that connect new developments to schools, parks, or adjacent developments.

**Existing Parks and Recreation Programs**

Maintain the existing park and recreation facilities and programs located within the plan area.

Conduct maintenance and renovations to enhance existing regional park and recreation facilities and programs.

Pierce County should continue the ownership and management of Frontier Park and should complete the Frontier Park Master Site Plan process.
GOALS

Create transportation corridors and streetscapes that are visually attractive and functional for both vehicular and nonmotorized transportation.

TRANSPORTATION CORRIDORS AND STREETSCAPES

GOAL GR T-1
Create an interconnected, multimodal transportation system that provides amenities to its users and convenient access to nearby urban areas while retaining a rural character.

GR T-1.1
Promote increased transit service and tourism-related transportation within the plan area.

GR T-1.1.1
Transit service should be a priority for community centers.

GR T-1.1.2
Consider a rail stop south of 224th St. E. as close as possible to the Graham Commercial Center.

GR T-1.2
Design roads and throughways to promote efficient movement of vehicles within the plan area while retaining the rural character.

GR T-1.2.1
Limit the number of traffic lights to maintain good traffic flow, particularly on Meridian Avenue.

GR T-1.2.2
Provide interconnectivity between subdivisions and commercial projects to the greatest extent possible.

GR T-1.2.2.1
Developers of subdivisions shall provide roadway connections to all County roadways that abut their property, except where it is necessary to limit the number of access points along main roads or where shared accesses better facilitate traffic flow.

GR T-1.2.2.2
If access is provided to only one County roadway, then at least one stub road shall be built within the development to the property line of an abutting parcel to provide for potential future connection(s), unless environmental constraints preclude any such connection.

GR T-1.2.2.3
Priority shall be given to connecting to existing stub roads, existing platted rights-of-way, and/or future improvement projects as defined in County plans and programs.

GR T-1.2.3
The County shall, where feasible, provide pedestrian facilities when reconstructing or building new roadways. In urban areas, the improvement will consist of a sidewalk on at least one side of the roadway. In rural areas, a 6-foot width of crushed gravel will be provided on both shoulders of the roadway.
Where adequate right-of-way exists in rural areas, a pedestrian pathway separated from the road by the drainage way or other buffer will be considered.

Retain existing scenic country roads in a rural character.

Locate infrastructure to increase connectivity between project phases and adjacent sites is accomplished during the land development process.

Orient streets to take advantage of scenic views and vistas.

Provide for efficient traffic flow and accommodate emergency vehicle operations by providing adequate parking in new subdivisions and school sites. New subdivisions are required to provide either on-street parking or shared off-street parking in urban areas and apply design standards for accommodating adequate off-street parking. A total of 3 parking spaces shall be provided in the urban area for each new single-family home. On-street parking shall be prohibited in rural areas. The following design techniques and standards should be applied:

Within urban residential developments, provide a minimum of 1 on-street parking space or off-street shared parking space per dwelling unit, dispersed in convenient locations throughout the development, for guest parking. The parking stalls should be located within 150 feet of the residences being served and may be clustered to serve multiple dwelling units.

Modify off-street parking for urban residential development to provide for at least 2 vehicles per dwelling unit. Garage areas shall not be included in the required off-street parking area (i.e., the garage area shall be in addition to the 2 required off-street parking spaces).

Driveways shall be at least 24 feet in length as measured from the face of the garage to the back of the sidewalk to prevent larger and longer vehicles from protruding into the traveled way.

Side yard setbacks (from the structure to the property line) shall be at least 5 feet on one side and at least 10 feet on the other side to allow vehicles to access the rear yard. This distance may be reduced only when alleys provide rear yard access.

Review and, if necessary, modify parking standards for school sites to provide adequate on-site parking for school events. Construct overflow parking areas of permeable materials such as grasscrete, permeable pavers, or pervious concrete.

Require minimum lot sizes and lot widths to better accommodate on-street and off-street parking. Allow lot width reductions only where adequate off-street shared parking is provided.
GR T-1.3.7  
In developments with private road systems, the homeowners’ covenants shall require employment of a security or towing service to monitor at least twice daily and tow vehicles that are parked in the traveled way.

GR T-1.3.8  
Construct on-street parking and off-street shared parking areas of permeable materials in conformance with the most current Pierce County Stormwater Management and Site Development Manual.

GR T-1.3.9  
On-street and off-street parking spaces shall be at least 22 feet in length. On-street parking space width shall be as outlined in the Pierce County road standards. Off-street shared parking spaces shall be at least 8 feet wide.

GR T-1.4  
Synchronize traffic signals where possible to provide for uninterrupted traffic flow.

GR T-1.5  
Require construction of pedestrian facilities by developers of residential, commercial, and industrial projects on all County roadways that abut their property.

GR T-1.5.1  
Construct sidewalks in urban areas.

GR T-1.5.2  
In rural areas, the improvement shall consist of a 6-foot width of crushed gravel on the roadway shoulder. Where right-of-way exists, construct a gravel pathway that is separated from the road by the drainage way or other buffer.

GR T-1.6  
Pursue innovative drainage design techniques to address flooding issues, such as those experienced along 224th St. E.

GR T-1.7  
Provide emergency warning signage at the intersection of 200th St. E. and Orting-Kapowsin Highway that directs traffic away from the Puyallup Valley in case of a natural disaster.

GOAL GR T-2  
Implement transportation improvements in the plan area in accordance with the project recommendations included in the Graham Community Plan.

GR T-2.1  
Use the plan’s project list and maps to guide programming and implementation of transportation projects.

GR T-2.2  
Further refine the transportation concepts in the Graham Rural Activity Center and finance these transportation improvements with a combination of public and developer funds.

GR T-2.3  
Pierce County shall work with the Washington State Department of Transportation to define consolidated east-west access roadways to serve new commercial sites within the Graham Rural Activity Center.
**DOMESTIC WATER**

**GOAL GR U-1**  
Provide adequate water supplies to meet the needs of existing residents as well as proposed new development.

**GR U-1.1**  
Ensure adequate domestic water to serve development and agricultural uses within the plan area.

**GR U-1.2**  
Enhance water conservation by requiring plumbing fixtures that conserve water, instituting leak detection and correction programs, and by developing strict irrigation and landscaping standards.

**GR U-1.3**  
Require landscaping that does not demand extensive irrigation for its survival, place an emphasis on the use of indigenous plant materials, and limit the extent of native vegetation removal.

**GR U-1.4**  
Encourage existing Class A water systems to work with Class B water systems or individuals that may have underutilized water rights to acquire these systems to expand available capacity.

**GR U-1.5**  
Protect groundwater supplies near the 304th Street landfill.

**GR U-1.5.1**  
The Tacoma Pierce County Health Department (TPCHD) shall conduct a study to evaluate the current upward gradient pressure of the aquifer system underlying the 304th Street landfill and to determine how much additional water withdrawal may occur from the aquifer before posing a contamination risk to the groundwater supplies.

**GR U-1.5.2**  
The TPCHD shall certify new wells within one mile of the 304th Street landfill to determine cumulative impacts to the underlying aquifer system.

**GR U-1.5.3**  
The TPCHD shall restrict additional water withdrawals, except test wells, within one mile of the 304th Street landfill when the underlying aquifer water table height is lowered to the point where negative impacts to the landfill lining and groundwater supplies may occur.

**STORMWATER FACILITIES**

**GOAL GR U-2**  
Develop stormwater facilities that are functional, environmentally sound, and aesthetically pleasing.

**GR U-2.1**  
Provide stormwater facilities within the plan area to mitigate existing stormwater problems and design these facilities to blend with and enhance natural systems.
Solid Waste

Goal GR U-3: Protect the natural environment and public health and safety related to Municipal Solid Waste (MSW) landfill facilities.

GR U-3.1: Establish standards for the siting of new or expansion of existing MSW landfill facilities to protect the public health, safety, and welfare and to address environmental impacts.

GR U-3.1.1: The siting of any proposed MSW landfill or any proposed expansion of an existing MSW landfill shall follow applicable County, state, and federal statutes and regulations regarding criteria for appropriate site selection.

GR U-3.1.2: The siting of any proposed MSW landfill or any proposed expansion of an existing MSW landfill in the plan area shall not be within 5 miles of any defined shorelines of the state or direct tributaries to a shoreline of the state, including Lake Kapowsin, Tanwax Lake, Whitman Lake, Morgan Lake, Ohop Creek, Kapowsin Creek, Puyallup River, Muck Creek and South Creek, or within 1 mile of any other river, stream, creek, or tributary within or adjacent to the plan area.

GR U-3.1.3: No new MSW landfill shall be located over a sole source aquifer in the plan area given the strong potential to pollute future needed water supplies. In addition, no MSW landfill shall be permitted in certain locations with regard to pollution of water (surface and groundwater) in areas of the plan area that have a high preponderance of outwash materials (gravel, sand, or rock).

GR U-3.1.3.1: No siting shall be approved and permitted for a site which has been fully examined independently and documented to contain a significant preponderance of one or more of the following U.S. Geological Survey defined soils: alluvium, peat, Electron mudflow, Osceola mudflow, Marshel formation, and/or Vashon Drift recessional outwash, advance gravel, or Steilacoom gravel.

GR U-3.1.3.2: The County shall require independent review of site studies of the characteristics of any proposed site to reduce any potential compromising of the parameters, methods, and conclusions of the geologic studies which predict the rate at which contaminants move through underlying strata.

GR U-3.1.3.3: The depth of the water table and levels of aquifers shall be considered primary health concerns by County officials and the Hearing Examiner in any review of a proposed MSW landfill application or an application to expand an existing MSW landfill.

GR U-3.1.3.4: The County and TPCHD shall require a rigorous monitoring regime as landfills can create deliberate fractures, underground water tables, as well as significantly increase fluid pressure.
The siting of any proposed MSW landfill or any proposed expansion of an existing MSW landfill in the plan area shall not permit the filling of any wetlands unless it is clear that no other practicable alternative exists. Any compensatory wetlands to mitigate for impacts associated with the construction of a MSW landfill shall be located in the same Water Resource Inventory Area (WRIA).

The perimeter buffer around any new proposed MSW landfill or any proposed expansion of an existing MSW landfill shall be no less than 1,000 feet in width and shall be planted with a dense cover of native vegetation, preferably composed of native conifer trees, to adequately screen the landfill facility from adjacent neighbors and roadways.

No new proposed MSW landfill or any proposed expansion of an existing MSW landfill shall be located in a floodplain unless an Environmental Impact Statement (EIS) using the best available science unequivocally indicates that the facility will not restrict the flow of the 100-year flood, reduce the temporary water storage capacity of the floodplain, or result in a washout of solid waste and pose a hazard to human health or the environment.

Any plan for a proposed MSW landfill or any proposed expansion of an existing MSW landfill shall describe in detail the corrective action programs to be initiated if groundwater contained within the aquifer or surface water is contaminated. Thus an application’s site monitoring and remediation plan should be resolved during the site selection process and not later in an anticipated construction and operation permit application.

Any formal application to expand laterally the size of any public or private MSW landfill currently existing in the plan area shall be subject to a number of considerations:

Such older landfills must meet newer County, state and federal regulations and are not eligible for regulatory waivers of newer waste management standards.

A mandatory EIS must adequately address alternatives to the proposed expansion including, at a minimum, other alternative in-county locations as well as long-hauling, with data found to be acceptable by reputable third parties such as the Environmental Protection Agency and the U.S. Army Corps of Engineers.

The mandatory EIS must fully document, based on public/private records and the best available science, the historical impact of the current facility on contamination to any sole source aquifer located under the facility. A full and faithful record shall be compiled by the Tacoma-Pierce County Health Department (TPCHD) to reflect incidents of failure to contain waste, litter, leachate, and toxic air emissions from the landfill, and shall be considered in the review process.
Any EIS review of a proposal shall be subject to review by the U.S. Environmental Protection Agency (40 CFR 232), the U.S. Army Corps of Engineers (33 CFR Part 323), and the U.S. Fish and Wildlife Service when wetlands, aquifers, and streams may be negatively impacted. Such review shall pertain even if no federal financial assistance is involved.

No expansion shall be permitted to any MSW landfill currently sited over a sole source aquifer, in a critical aquifer recharge area, or in a wellhead protection area in the plan area and grandfathered by virtue of establishment prior to the April 27, 1999 effective date for RCW 70.95.060.

Conduct adequate monitoring and testing of MSW landfill facilities to ensure that the facility is not posing any negative impacts to public health, safety, and welfare nor resulting in any unmitigated environmental impacts.

The TPCHD shall produce an annual written report on the research and field testing of contaminants found in the groundwater at any current or future approved MSW landfill site within the plan area. TPCHD shall provide a copy of such report to water purveyors and landowners within a 10-mile radius of such sites.

The TPCHD shall require MSW permit holders to provide monitoring and testing information in an acceptable electronic format.

The TPCHD shall be the responsible agency for ensuring that proper and appropriate monitoring and testing is conducted on MSW landfills. The TPCHD may oversee the hiring of neutral, third party consultants to conduct the necessary monitoring and testing or may complete such monitoring or testing with adequately trained TPCHD staff.

Ensure that all plans and reports regarding monitoring and testing of MSW landfills in the plan area are readily available to citizens.

The TPCHD shall post monitoring and testing information regarding MSW landfills on a public web page and in all local newspapers of general distribution. This information shall include hydrogeologic and groundwater monitoring reports, leak detection, and collection system monitoring reports, leachate monitoring reports, and surface water monitoring reports.

The following list of actions needs to be completed in order to implement the policies contained within this plan. They are arranged according to the timeframe within which each should be completed: short, medium, or long term. Short-term actions should occur within one year of plan adoption. Mid-term actions should be completed within 2-5 years. Long-term actions should be completed within 5-10 years of plan adoption. The entity or entities responsible for leading the effort to complete the action item is listed in parenthesis following
the action. Actions are assigned to the Land Use Advisory Commission (LUAC), Pierce County Planning and Land Services (PALS), Pierce County Economic Development (ED), Pierce County Parks and Recreation (Parks), Pierce County Public Works & Utilities (PWU), and Tacoma-Pierce County Health Department (TPCHD).

## SHORT TERM ACTIONS (UPON PLAN ADOPTION TO 1 YEAR)

### Domestic Water

1. Provide Letters of Water Availability to the Graham Land Use Advisory Commission and the Pierce County Hearing Examiner for consideration during the public hearing process. (PALS)
2. Amend the Pierce County Comprehensive Plan to include language regarding protecting water rights for designated Agricultural Resource Lands. (PALS)

### Law Enforcement and Fire Protection

3. Establish a process for local fire district review and comment on development proposals. (PALS, FPB, Graham Fire District)

### Stormwater Facilities

4. Amend Title 18J, Design Standards and Guidelines to establish stormwater detention facility design standards and/or work with PWU-Water Programs Division to develop new Guidelines for Design of Public Stormwater Facilities. (PALS, PWU-Water Programs)

### Undergrounding of Utilities

5. Amend the Pierce County Manual on Accommodating Utilities to include provisions for the undergrounding of overhead utility lines within the County right-of-way. (PWU)

### Parks

6. Establish a park impact fee, land dedication or fee-in-lieu-of dedication program for community and neighborhood level parks within the plan area. (PALS, Parks and Recreation)
7. Amend the Pierce County Development Regulations to require the dedication of regional trails or a fee-in-lieu-of land dedication during the site development process and to require the installation of nonmotorized transportation trails that connect new developments to schools, parks, or adjacent developments. (PALS, Parks and Recreation)
8. Amend Title 18J, Development Regulations – Design Standards and Guidelines to incorporate park and recreation design and location criteria. (PALS, Parks)

### Transportation

9. Amend Titles 17B, 18J, and the “Manual on Design Guidelines and Specifications for Road and Bridge Construction in Pierce County” to:
10. Require multiple access points into and out of developments and road extensions or stub roads to adjacent parcels for present and future roadway development and connectivity;
11. Provide pedestrian and bicycle facilities within and abutting new developments;
12. Institute new parking standards for on-street parking, driveway lengths, off-street parking, towing enforcement, minimum lot widths and side yard setbacks in developments within urban areas. (PALS, PWU-Transportation)
13. Amend the Pierce County Capital Facilities Element and Pierce County Transportation Plan to include transportation improvement projects identified in the plan. (PWU-Transportation)
14. Amend the Pierce County Nonmotorized Transportation Plan to update with Proposed Trail System Map recommendations. (PWU-Transportation)
15. Incorporate the Plan’s transportation project priorities into Six-Year Transportation Improvement Program project selection process. (PWU-Transportation)

**Mid-Term Actions (1-5 Years)**

**Domestic Water**
1. Initiate water conservation measures. (PWU – Sewer and Water Utility Division and local water purveyors)
2. Amend the Letter of Water Availability form to require additional information about water rights and existing and available water capacity to serve new development. (TPCHD, PALS)
3. Establish the Pierce County Water Utility to provide wholesale water to water purveyors operating within Pierce County. (PWU – Sewer and Water Utility Division and local water purveyors)

**Public Schools**
4. Work with the Pierce County Council to increase Bethel School District impact fees. (Bethel School District)

**Solid Waste**
5. Consider incorporating more detailed solid waste facility siting criteria and monitoring and remediation plan requirements in the next update of the Pierce County Solid Waste Management Plan. (PWU-Solid Waste, TPCHD)
6. Post a detailed summary of existing landfill monitoring and testing information on the TPCHD website. (TPCHD)

**Parks**
7. Finalize the Frontier Park Master Development Site Plan and implement the Plan through approval by the County Hearing Examiner. (Parks, PALS)
8. Identify and maintain a list of civic, community groups and local governmental agency contacts that are interested in park and recreation development in the Graham area. (Parks)
9. Initiate the community review process for the concept of creating a local park district or service area for the development of community and neighborhood level parks within the plan area. (Parks)

10. Pursue partnership opportunities for the acquisition of regional, neighborhood and community park sites. (Parks)

11. Form a joint partnership to increase recreational opportunities within the plan area. (Parks, Local School Districts)

12. Expand walking trails at Frontier Park. (Parks)

**Transportation**

13. Evaluate the speed limit on 224th St. E. between 82nd Ave. and Meridian to determine the feasibility of reducing the speed limit to 35 miles per hour or implementing other speed reduction methods. (PWU-Transportation)

14. Evaluate the feasibility of additional transit routes, increased bus frequencies, and additional bus pullouts. (Pierce Transit, PWU-Transportation)

15. Increase the number of transit stops, which include shelters and seating, at identified community centers. (PWU-Transportation, Pierce Transit)

16. Construct drainage improvements to address flooding issues along 224th St. E. (PWU – Water Programs, PWU-Transportation)

17. Refine concepts for traffic and nonmotorized circulation within the Graham RAC and incorporate into development review process. (PWU-Transportation, PALS, Washington State Department of Transportation, private developers)

18. Install emergency warning signage at the intersection of 200th St. E. and Orting-Kapowsin Highway that directs traffic away from the Puyallup Valley in the case of a natural disaster event. (PWU-Transportation, DEM)

**LONG TERM ACTIONS (5-10 YEARS)**

**Domestic Water**

1. Evaluate the merger of Class A and unused or underutilized Class B water systems. (PWU – Sewer and Water Utility Division, WDOH, TPCHD)

**Law Enforcement and Fire Protection**

2. Locate a police substation within the plan area. Give priority to the following areas:
3. Graham Library property
4. Graham Fire Department station
5. 304th St. E. and Meridian Rural Activity Center (Sheriffs Department)

**Parks**

6. Acquire additional parcels of land for future park and trail development. (Parks and Recreation)
Transportation

7. Evaluate the feasibility of a rail stop in or near the Graham Rural Activity Center located at 224th St. E. and Meridian. (PWU-Transportation, Pierce Transit, Tacoma Rail Mountain Division)
Public Education

Graham Community Plan
Chapter 7: Plan Monitoring

The 1990 State Growth Management Act (GMA) requires jurisdictions planning under GMA to report on progress made in implementing the Act, and to subject their comprehensive plans to continuing evaluation and review. As part of the County’s Comprehensive Plan, the Graham Community Plan is subject to this requirement. One mechanism for conducting this evaluation and review is to monitor the development standards, regulations, actions, and other programs called for in the plan for the purpose of determining their effectiveness in fulfilling the vision of each of the five elements of the plan.

Monitoring actions may include the development and implementation of regulations and design standards, coordinating the provision of facilities and services, developing educational programs and handouts, acquiring parks, preserving open space, and other actions. Information obtained from the monitoring program can be used to offer recommendations to decision makers as to what changes to the community plan may be needed in order to attain specified goals and meet the visions in the plan.
Appendix G: Key Peninsula Community Plan

The Key Peninsula Community Plan’s narrative text and policies are in addition to the Countywide Comprehensive Plan narrative text and policies and are only applicable within the Key Peninsula Community Plan Boundary.

- “Current” or “Existing” conditions are in reference to conditions at time of adoption (Adopted Ord. 2007-75s, Effective 6/1/2008).
- “Proposed” or “Desired” conditions are those which required Council action and may have also been amended over time through a Comprehensive Plan Amendment (amendments are reflected in this document).

Chapter 7: Plan Monitoring ................................................................. G-150
Chapter 1: Introduction

General Description of the Plan Area

The Key Peninsula is located in western Pierce County and surrounded by marine waters on three sides. The northern boundary of the Key Peninsula is adjacent to Kitsap County and the northwestern boundary is adjacent to Mason County. The Gig Harbor Peninsula is located to the east of the plan area across the Purdy Bridge. Herron Island is within the community plan boundary and is located off of the Peninsula’s western shoreline in Case Inlet.

The plan area is approximately 60 square miles and is designated for rural and resource land uses under the Pierce County Comprehensive Plan. The community plan does not contain an urban area as defined by the Washington State Growth Management Act (GMA). There are many small, distinct communities located throughout the Key Peninsula with seven of these areas recognized as rural commercial centers. Most residents of the Key Peninsula identify themselves as coming from one of these small rural commercial locations.

The Key Peninsula is characterized by a variety of rural land uses on large lots. Residential home sites, agricultural lands, and forest lands dominate the land use pattern. Several recreational campgrounds including two state parks are located along the extensive marine shorelines that surround the Peninsula. State Route 302 (SR 302) crosses through the northern portion of the community. Several of the small commercial areas are located along this state highway. Additional commercial areas are located south of SR 302 at Key Center, Home, and Longbranch. The topography of the Peninsula is considered rolling with no prominent hill tops. The small bays and inlets are generally considered low bank waterfront and most are improved with residential homes. Other areas of the Peninsula that are more exposed to the weather and winter storms have high banks and marine bluffs. There are several small lakes, wetlands, and numerous streams. Many of the larger streams support salmon runs.

Demographics

Growth Rate and Population Forecast

The population of the Key Peninsula continues to increase. The total population of the Key Peninsula was 11,016 in 1990. The population had increased by 3,952 citizens to a total of 14,968 in the year 2000. This amounts to an annual average growth rate of 3.1%. According to the Puget Sound Regional Council census tract estimates, the population of the Key Peninsula grew to 16,721 in 2006.

Population forecasting is an inexact science. For example, the population allocation of 16,369 for the year 2022 as adopted by the Pierce County Council under Ordinance 2003-104s has
already been surpassed. Many assumptions are used in forecast models in an attempt to predict what the population will be in the future. The population increase of 1,753 on the Key Peninsula between 2000 and 2006 is consistent with new residential construction activity. The following table describes residential building permits issued on the Key Peninsula between 2001 and 2005. If new residential permit trends continue at an average of 200 annually, the population of the Key Peninsula may approach 25,000 by the year 2025.

**DEMOGRAPHICS**

Demographics for the plan area were compiled from information contained within the year 2000 census survey. Census tracts 725.03, 726.01, 726.02, and 726.03 were used to derive the demographic information. Census tract 726.03 contains Anderson Island as well as the southern Key Peninsula.

Most residents of the Key Peninsula own their homes. Only 15% of Peninsula residents are renters. One interesting housing fact about the Key Peninsula is that it has a much higher (15% of total housing) rate of seasonal occupancy than other parts of Pierce County. This rate is coming down however, as many of the historical vacation homes are turning into permanent residences.

The Key Peninsula’s population is fairly educated with 28% of the citizens having a college degree. The median household income was $49,194 in the year 2000 which was higher than the Pierce County average of $45,200.

**EARLY HISTORY OF KEY PENINSULA**

The Key Peninsula was part of the territory Native Americans traditionally used for camping, fishing, hunting, and gathering for many centuries before Europeans came. People of the Squaxin Island and Nisqually Tribes fished in the streams and the Puget Sound, dug shellfish, gathered resources including berry fruits, vegetables, and other local foods, and hunted in the peninsulas forests and valleys. They navigated the local waters using canoes. In addition, a number of trails were used to traverse the area and connect water bodies surrounding the Peninsula with islands and the mainland.

Salmon was the most important food resource. In addition to salmon, oysters, clams, camas roots, berries, nettles and roots provided supplemental food resources. Winter food was prepared through drying, smoking and other preservation methods.

No permanent Native American village sites have been identified on the Key Peninsula. Various shell middens have been unearthed along the shorelines of the Key Peninsula and numerous temporary fishing and habitation sites were located near the streams and bays and were well known among early settlers. These sites were utilized by Native Americans for camping, fishing, and digging shellfish.
In 1792, Lieutenant Peter Puget working for British Captain George Vancouver surveyed the body of water named after him later. An American naval expedition under Captain Charles Wilkes surveyed the south Puget Sound area in 1841. Wilkes’ survey included the water bodies, bays, inlets, etc. around the Key Peninsula. Carr Inlet, Case Inlet, and Drayton Passage were named after members of the Wilkes’ survey crew.

Some of the early regular interactions between the local Native Americans and Europeans took place at the Hudson’s Bay Company’s trading post established in the 1830s north of the Nisqually delta near the present-day city of DuPont. Some local Native Americans were hired to work for the Hudson’s Bay Company. Some Hudson’s Bay Company employees married the local Native American women and started families. Descendents from several of these unions still reside in the area. Even after the Indian War of 1855-56, some remaining Native Americans in the area traded baskets, fish, or dugout canoes for articles of clothing, tobacco and other provisions.

Europeans started to arrive in Key Peninsula in the 1830s. A few former mountain men who had been engaged in fur trapping and trade in Canada came and settled down in the area. They were able to survive in the wilderness through their simple way of life, ability to live off of the land and familiarity with the local Native American dialects and trading languages.

More settlers started to come into the Key Peninsula after the U.S. Congress adopted the Donation Land law in 1850 which encouraged people to emigrate west and establish Homesteads. Charles Taylor, a Scotsman who decided to jump from a British ship due to harsh conditions on board, is considered the first permanent settler on the Peninsula. He started his residency at Taylor Bay in 1852. He married a local Nisqually Indian woman. William D. Vaughn arrived in the Peninsula in the same year.

The Key Peninsula was originally called Longbranch Peninsula based on the maps of the Wilkes Expedition. In the 1930s, Key Peninsula was officially adopted as the name of the Peninsula. A contest was sponsored to select a new official name for the Peninsula in 1931 by the business community. The entry “Key Peninsula” (based on the shape of the Peninsula) was submitted by Ed M. Stone of Lakebay who won the prize.

**EARLY COMMUNITIES**

**MINTER**

Minter was settled by George Minter and family in 1882. He established his homestead near the stream bearing his name. A school and post office were established in the mid-1880’s. The first postmaster was Mrs. Lucinda Minter. The community was renamed Elgin in 1892. Logging and homesteading of early days were gradually replaced by farming and aquaculture. The fish hatchery on Minter Creek was established in the 1930s.

**HOME**

Home was a unique community. The settlement in Home started in 1896 on 26 acres of land on Von Geldern Cove purchased by George Allen, O.A. Verity, and L. F. O’Dell. These three men
came from a failed experimental industrial cooperative colony, Glennis, located near Clear Lake in Pierce County. Two years later, these men founded the Mutual Home Association to attract people to live in the Home colony. The Home plat of 217 acres was filed in 1909. Residents were allowed to explore a variety of lifestyles, political issues, and philosophies. Home attracted a variety of non-conformists, free thinkers, activists, and writers, including anarchists and socialists. A school, store, and community building were erected. Special events such as musicals, lectures, and dances were held regularly in the community building called Liberty Hall. Another community building called Harmony Hall was constructed and held dances and other social events. An orchestra and musical band were organized. A baseball team was organized in Home. Baseball games were held regularly on Sunday on the community ball field. A legal dispute arose among the members when some became unhappy about the amendments made to the articles of incorporation of the Mutual Home Association which enabled the association to privatize some lands within the Home colony. In September 1919, the court ordered the Mutual Home Association be dissolved. After dissolution, the residents were able to buy the plot of land they had been leasing and life in Home continued normally. In the 1920s a poultry business prospered in Key Peninsula. Home had a cooperative that exported eggs to urban markets including Seattle. Home was designated to the Pierce County Register of Historic Places in 1990 as a historic district. Dadisman House and Home School are listed in the National Register of Historic Places.

**Herron**

Herron’s first settler was John Jensen. The place was named after Lewis Herron who made barrels for storage of food for the Wilkes Expedition. A post office was established in 1894 for the community with the name of Blanchard. The name Herron was brought back in 1913. The area produced a variety of fruits including prunes, apples, grapes, plums, cherries, pears, crab apples, and quinces. Herron became especially well known for prune production. Fruits were dried in a prune orchard dryer. Fruit production eventually declined due to competition from fruits grown in eastern Washington.

**Glen Cove**

Glen Cove started as a logging camp. Several families came and settled in the area then known as Balch’s Cove in the late 1880s. A post office was established in 1891. The name of the community was changed from Balch to Glen Cove by the postal authorities in 1896. A brickyard was established by Nick Petersen and Harry Winchester on the cove in the 1880s. Stores, a school, and post office were located at the bay. Glencove Hotel, a three-story Victorian-style building, was built by Nicholas and Agnes Petersen and opened in 1897. The hotel is still standing and is available as a bed and breakfast facility and to rent for special events such as weddings, parties, etc. The Glencove Hotel is listed in the Pierce County and National Registers.
of Historic Places. In the vicinity, YMCA Camp Seymour was established in 1905 on land donated by Mr. Seymour. A wide variety of summer activities continue to be offered there.

**LAKEBAY**

Lake Bay’s earliest settlers were William Creviston and his wife who settled in the area in 1871. Carl Lorenz established a saw mill in 1877. A school opened in 1878. Recognizing the need for steamboat transportation for people, freight, including logs and farm produce, and mail, Carl Lorenz and his sons launched a major steamboat business from Lake Bay in the 1880s. This early establishment of saw mill and steamboat businesses made Lorenz and Lake Bay well known throughout the early communities on Puget Sound. The Lorenz family operated the steamboat business with a number of steamboats in their fleet for more than four decades. A brick yard was operated in the 1880s. Henry Tiedman established the post office at Lake Bay in 1882. In 1894, postal authorities changed the name of the community into one word, Lakebay. A store and a hotel were also established. In the 1920s when poultry businesses prospered on the Key Peninsula, Lakebay had an agricultural cooperative that exported eggs to urban markets.

**LONGBRANCH**

Longbranch was named and platted in 1890 as a summer resort by Edward Yeazell. The place was originally called Long Branch and was named after a resort community in New Jersey. The name was changed to one word in 1894. Due to its isolation and inaccessibility, Yeazell’s resort venture was never realized. A post office was established in 1891 and Ernest E. Shellgren was its first postmaster. Logging was the main industry in the beginning. Small farms were established on cleared land and businesses developed in the area. Fertilizer plants and a blacksmith shop were among the local businesses. William Sipple and Henry and Franz Mahncke had large land holdings in the area and were prominent early citizens. William Sipple operated a ship building business and constructed a variety of boats as well as houses. He built a lighthouse on Filucy Bay in 1915 which became a familiar landmark. The lighthouse burned in 1971 and was never rebuilt.

**PURDY**

Purdy was established by Joseph Purdy in the 1880s. Tabor A. Sherman was the first postmaster. A town site was platted and a lumber mill was established on the waterfront. The timbers used in the construction of the wooden dock at the Bremerton Naval Shipyard were from the mill in Purdy. Lumber milling business declined when an economic depression hit in 1893. Starting in the 1900s the community engaged mostly in agriculture. The first Purdy bridge near Wauna was constructed in 1892, the second in 1919, and a third in 1938 connecting Gig Harbor Peninsula with Key Peninsula. The first bridge was a wooden draw bridge. The second turnstile bridge was moved from the Puyallup River. Draw or swing bridges allowed tug
boats tugging boomed logs to mills enter the lagoons. These bridges also shortened the trips for transport of farm produce from Kitsap and Mason Counties to Tacoma. The third bridge was constructed of box girder type.

**WAUNA**

Wauna, near Purdy, was platted in 1889. A post office was established in 1890. Soon, it became a commercial center owing to its long wharf and deep moorage bringing regular steamboat traffic. The waterfront store and lounge for steamboat customers served as a social gathering place. Logging and brush camps, ranching, and tree farms comprised the economic activities around the 1900s. The community later established a reputation as a summer resort. Due to a wide array of recreational opportunities including swimming, clam digging, boating, and fishing, many families from urban areas came to Wauna during the summer months. The Wauna Post Office and Store located on the sand spit was continually operated by the White and Goldman families for nearly nine decades. When the Wauna Post Office relocated to the Lake Kathryn location, the old Wauna Post Office and Store property was sold to Pierce County and became a park site. It was designated to Pierce County Register of Historic Places in 1990. Deteriorated conditions of the building continued to pose safety and aesthetics problems. The property was de-listed from the historic register and demolished in 2006.

**VAUGHN**

Vaughn’s settlement began with the arrival of William Vaughn in 1852. He engaged in logging and established a homestead. Additional families arrived in the area and established homesteads by the 1880s. A post office was established in 1888 and its first postmaster was Mrs. Alice A. Hunt. Shingle and saw mills were established on the shoreline. Harvested logs were shipped out from the Vaughn Bay. An oyster business was established in Vaughn in the late 1890s by Mr. Rodman and Mr. Fox. First, Eastern oysters were cultivated. Later, Willapa and Japanese oysters were introduced to the area. A few families built the first schoolhouse in 1886. Community events were held in the school building. The Vaughn Bay Public Library Association was formed in 1891 which led to building the Library Hall in 1893 on the land donated by the Van Slyke family. A variety of community activities including dances were held in the Library Hall until it closed in 1958.

**KEY CENTER**

Key Center’s earliest settler was Andrew Olson who arrived in the area in the 1880s and homesteaded. A few additional families including the Palmer, Powell, and Pollack families settled in the area. In the 1930s, A. E. Visell Lumber Company, C. D. Hipp Grocery Store, and Gene Brown’s Garage comprised a business center at the intersection of today’s Key Peninsula Highway and Olson and Cramer Road KPN. In 1931, the business community on the Key Peninsula led by A. E. Visell sponsored a contest to select an official name for the Peninsula. Ed M. Stone of Lakebay won the $25 prize with his entry, “Key Peninsula.” Stone thought the shape of the Peninsula resembled a key. Soon, the business center became known as “Key Center” because it was located in the center of the Peninsula.
PLANNING HISTORY

COUNTY PLANNING

1962 PIERCE COUNTY COMPREHENSIVE PLAN AND ZONING

The first Pierce County Comprehensive Land Use Plan was adopted on April 2, 1962. The Pierce County Zoning Code, which implemented the Comprehensive Plan, was adopted on October 8, 1962. The 1962 Pierce County Comprehensive Plan designated the Key Peninsula as “Rural Residential.” These rules followed very basic planning principles. Zoning districts were established that dictated the appropriate location for commercial business and residential homes. However, the Plan did not offer much protection from incompatible uses and did not recognize the unique individuality of communities. In May 1966, a Comprehensive Plan Study was completed for the NE corner of the Peninsula east of 134th Avenue under Section 701 of the Federal Housing Act. This study served as a platform for planning efforts on the Peninsula in the early 1970s.

1975 GIG HARBOR PENINSULA COMPREHENSIVE PLAN AND DEVELOPMENT REGULATIONS

In June 1975, the Gig Harbor Peninsula Comprehensive Plan and Development Regulations were adopted by the Pierce County Board of Commissioners. The 1975 Gig Harbor Peninsula Comprehensive Plan included land in the Burley-Minter-Wauna area of the northeastern Key Peninsula, as well as the Gig Harbor Peninsula and Fox Island. This was a very innovative plan and zoning program. It was based on the physical features of the Peninsula such as topography and aquifer recharge areas. Lands that contained environmental constraints such as steep slopes or wetlands were considered the most sensitive and received a designation of Natural Environment. Areas that were appropriate for residential land uses were designated the Residential Environment. Land that had very few physical impediments to development and was located near SR 302 and 94th Avenue, SR 302 and 118th Avenue, and Key Peninsula Highway and 134th Avenue received an Urban Environment designation. Generally, any land use was permitted in any zone classification provided the proposed development met minimum environmental standards and was compatible with adjacent uses. This zoning scheme was quite successful and remained in effect until January 1, 1995 when a new Pierce County Comprehensive Plan was adopted pursuant to the 1990 Washington State Growth Act.

BURLEY MINTER DRAINAGE BASIN WATER QUALITY PLAN

In January 1988, the Burley/Minter Drainage Basin Water Quality Plan was adopted. This plan established a sensitive watershed environment in the Burley Lagoon and Minter Creek areas. Due to contamination of shellfish beds in Burley Lagoon and Minter Bay, development restrictions including larger lot sizes, best management practices, and buffers on streams and waterways were established. In November 1978, these areas were also designated as environmentally sensitive areas pursuant to the State Environmental Policy Act (SEPA).
In April 1990, the Growth Management Act (GMA) was passed by the Washington State Legislature. It required Pierce County to update its existing Comprehensive Plan and Zoning Regulations, including community plans. The GMA required Pierce County to develop and adopt a comprehensive plan which would control residential, commercial, and industrial growth. Thirteen goals are listed in GMA to guide policy development in six required elements. The required elements include land use, housing, capital facilities, utilities, rural, and transportation. Pierce County also elected to include four additional elements: environment and critical areas, economic development, community plans, and essential public facilities. Each of the six GMA required elements must conform to specific standards set in the legislation. GMA required cities and counties to plan for growth based on population forecasts. Where growth is allowed, facilities and services must be planned and provided.

The Rural Element requirements in the originally adopted GMA contained very general standards. It stated that counties shall include a rural element including lands that are not designated for urban growth, agriculture, forest, or mineral resources. The Rural Element shall permit land uses that are compatible with the rural character and provide for a variety of rural densities. Rural areas must also be planned for and include preservation of open space, agricultural opportunities, recreational opportunities, and protection of natural resources.

In April 1991, interim Growth Management Policies were adopted as a transition between the 1962 Comprehensive Plan and the more complex plan developed under the Growth Management Act. In June 1992, the Pierce County Countywide Planning Policies were adopted. The policies provided the framework and process by which Pierce County and the cities and towns within the County would establish urban growth areas, provide infrastructure and services, and preserve agricultural and natural resource lands. In November 1994, Pierce County adopted a new Comprehensive Plan. The 1994 Pierce County Comprehensive Plan replaced the 1962 Pierce County Comprehensive Plan in its entirety. The plan established population projections, urban growth areas, and rural areas. The 1994 Comprehensive Plan identified Key Peninsula as a “rural” area.

**COMMUNITY PLANNING**

Pierce County Comprehensive Plan policies located in the Community Plans Element address community autonomy, community character, new community plans, consistency with the Comprehensive Plan, consistency with the Development Regulations-Zoning, transition strategies, and joint planning agreements.

The Community Plans Element of the 1994 Pierce County Comprehensive Plan envisions a local voice in how the Comprehensive Plan and its Development Regulations will be carried out in communities. Community plans exemplify how the objectives and policies of the Comprehensive Plan play out when applied to detailed and specific conditions. They indicate specific land use designations, appropriate densities, and the design standards that should apply in community planning areas. Preserving and building community character while ensuring an efficient and predictable development approval process is a central theme.
Community plans help citizens decide what they want to retain and what they want to change at the local level.

Although the Growth Management Act (GMA) does not require comprehensive plans to provide for community plans, Pierce County Ordinance 90-47S directs County officials to prepare a Community Plans Element of the Comprehensive Plan. The majority of the unincorporated County population resides in community plan areas. The Community Plans Element spells out how to coordinate consistency between community plans and the Comprehensive Plan. Community plans must be consistent with the Comprehensive Plan and the GMA. Flexibility exists only in the interpretation of how Comprehensive Plan policies apply in a given community or in areas where the Comprehensive Plan is silent on an issue or does not provide detailed guidance.

**SCOPE OF THE COMMUNITY PLAN**

**LEGISLATIVE AUTHORITY TO DEVELOP THE PLAN**

In the Community Plans Element of the 1994 Pierce County Comprehensive Plan, the Key Peninsula was identified as a community in need of a community plan. The Pierce County Council passed Resolution R2003-42s on May 27, 2003 requesting the Department of Planning and Land Services begin the development of a community plan for the Key Peninsula.

**PURPOSE AND USE OF THE COMMUNITY PLAN**

The Key Peninsula Community Plan will give residents, property owners, business people, and Pierce County government a detailed sense of how the community wants to develop in the future and what standards could be utilized to create and maintain the look and feel identified in the community plan. In some circumstances, the plan refines the Pierce County Comprehensive Plan to more closely reflect the needs, concerns, and desires of the Peninsula residents. The plan also identifies actions necessary to implement the community plan, including adopting or revising land use regulations; identifying priorities for use of public funds to develop physical improvements such as roads and sidewalks, landscaping and streetlighting, park and recreation development; and economic programs.

**VISIONS, GOALS, OBJECTIVES, PRINCIPLES, AND STANDARDS**

**VISIONS**

Visioning is the process of defining the expectation of what the community could be in the future. Visioning is typically completed through a series of public meetings or workshops structured to allow the community to articulate hopes for the future. Statements, thoughts, and ideas brought forth in the visioning process become the basis for the visions, goals, objectives, and principles of the community plan.
Vision statements can be either: 1) broad - painting a picture of what the community should strive to be like, physically and socially; or 2) focused - to express how the concerns, values, and hopes of the community should be reflected in various topics.

Goals, objectives, and policies (principles and standards) are used to provide measurable statements to fulfill the vision statements and are an integral part of the visioning process.

**GOALS**

Goals describe a desirable future for the community: identifying who, what, why, and how the broad values and hopes set forth in the vision statement will be accomplished. Goals provide the framework from which objectives, policies (principles and standards), and implementation actions and recommendations will be developed.

**OBJECTIVES**

Objectives are statements which specifically define goal actions.

**POLICIES (PRINCIPLES AND STANDARDS)**

Principles set a particular course of action to accomplish objectives. Standards, quantitative or qualitative, are specific benchmarks or targets to be accomplished in the ongoing development of the community.

**IMPLEMENTATION ACTIONS AND RECOMMENDATIONS**

Implementation actions and recommendations are statements that provide changes to policy documents, regulations, capital facility plans, and statements directing agencies and community groups to revise or develop plans, regulations, and non-regulatory measures.

The vision and all of the goals, objectives, policies, and implementation actions and recommendations are developed through citizen comment and represent the will of the people translated into decision-oriented statements. When applying the policy statements, each should be afforded equal weight and consideration.

**PUBLIC INVOLVEMENT**

**KEY PENINSULA COMMUNITY PLANNING BOARD**

The development of the Key Peninsula Community Plan could not have been accomplished without the Key Peninsula Community Planning Board (KP CPB). The KP CPB consisted of a fifteen-member group representing a variety of interests and geographic locations of the community. Representatives included: Pierce County Fire District #16, Key Peninsula Business Association, Key
Peninsula Metro Parks, Key Peninsula Community Councils, a local real estate agent, a local farmer, and residents at large.

The KP CPB was charged with five main responsibilities: 1) serving as a sounding board for the community; 2) developing a vision statement and community-wide goals for the community plan area; 3) developing policies and implementing actions related to various topics; 4) guiding the development of policies and map changes that address community concerns while remaining consistent with the Comprehensive Plan; and 5) forwarding a draft updated Key Peninsula Community Plan to the Pierce County Planning Commission and Pierce County Council.

**Timeline for Public Involvement**

<table>
<thead>
<tr>
<th>Year</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Summer 2004</td>
<td>Planning Staff conducted a series of public outreach meetings to solicit interest in the community planning effort and to recruit Community Planning Board members. Meetings were held with the Longbranch Improvement Club, Key Peninsula News, Key Peninsula Business Association, Key Peninsula Community Council, Peninsula School Board, Key Peninsula Community Services, and the Key Peninsula Livable Communities Fair.</td>
</tr>
<tr>
<td>Fall 2004</td>
<td>Key Peninsula Community Planning Board (KP CPB) developed community-wide vision and goals with public input, which were completed in November 2004.</td>
</tr>
<tr>
<td>Winter 2004</td>
<td>The KP CPB hosted an open house to present the community-wide vision and goals to local residents and to solicit interest in the upcoming policy work.</td>
</tr>
<tr>
<td>Winter/Spring 2004</td>
<td>The KP CPB held public meetings regarding the Natural Environment, completing the Natural Environment Element on April 27, 2005.</td>
</tr>
<tr>
<td>Fall 2005</td>
<td>The KP CPB held public meetings regarding land use, completing the Land Use Element on December 13, 2005.</td>
</tr>
<tr>
<td>Spring 2006</td>
<td>The KP CPB held public meetings regarding transportation, completing the transportation section of the Facilities and Services Element on April 19, 2006.</td>
</tr>
<tr>
<td>Summer 2006</td>
<td>The KP CPB held public meetings regarding parks and recreation, completing the Park and Recreation section of the Facilities and Services Element on June 21, 2006.</td>
</tr>
<tr>
<td>Fall 2006</td>
<td>The KP CPB held public meetings regarding infrastructure and public services, completing the Facilities and Services Element on October 18, 2006.</td>
</tr>
</tbody>
</table>
Winter 2006  The KP CPB and design consultants BCRA held a “Design Charette” on December 9, 2006 to receive input and establish direction from local business owners and residents on questions regarding architectural and site design for the rural commercial areas.

Spring 2007  The KP CPB held public meetings regarding signs, building, and site design, completing the Community Character and Design Element on April 4, 2007.

Spring 2007  A second open house was held on April 10, 2007. The purpose of this open house was to provide a copy of the draft community plan policies and draft zoning map to the general public and to solicit comments for final Key Peninsula Community Planning Board consideration on April 18, 2007.

April 24, 2007  A Study Session was held with the Pierce County Planning Commission.

May 2007  The Pierce County Planning Commission held public hearings on the draft Key Peninsula Community Plan.

Survey

Background

In September 2004, Pierce County Planning and Land Services (PALS) distributed a community planning survey to households and businesses within the Key Peninsula Community Plan area. The survey was developed by PALS staff and based on a format used in various communities throughout Pierce County in previous land use planning efforts. The survey is intended to help PALS staff and community planning board members assess the community’s views regarding a variety topics including quality of life, land use, the economy, and public facilities and services. The survey did not solicit demographic information such as household size, income, or longevity.

The survey was distributed on September 1, 2004. It was mailed to all households and businesses on the Key Peninsula. A total of 7,625 surveys were mailed. Of these 7,261 surveys were mailed to private residences and 364 surveys were mailed to businesses. A response rate of 6.2% had been achieved as of September 23rd. This response rate compares favorably with the response rate for similar surveys conducted by PALS for other community plans.

The number of surveys returned (sample size) was large enough to accurately reflect the opinions of the surveyed population (Key Peninsula households and businesses) to within approximately +/- five percent at a 95% confidence level. This means that if 100 households were randomly selected in the survey area and asked the survey questions, 95% of the time those households would answer the survey questions to within approximately +/- five percent of the results provided in this report.
Survey Summary

The survey asked questions regarding quality of life; condition of the built and natural environment; economic development; land use planning and related controls; and levels of support for a variety of public facilities and services.

When asked about existing conditions within the community, respondents were most satisfied with emergency services such as police and fire, the quality of environmental features, and the adequacy of educational facilities. The respondents were least satisfied with the opportunities for local jobs, the condition of the transportation system, and the architectural design of civic and commercial buildings.

When asked to rate priorities for public facilities, improvements to existing roads ranked as the highest priority followed by increased access to publicly owned shorelines. Indoor recreational facilities were the lowest priority. In terms of public services, the availability of paramedic staff and presence of police were considered the greatest needs. Recreational programs at County parks were considered the lowest priority.

The survey results were be used by the community planning board as an aid in the development of the Key Peninsula Community Plan.

Summary of the Key Peninsula Community Plan

The Key Peninsula Community Plan contains policies and implementing actions for five major subject areas or elements: Land Use, Community Character and Design, Natural Environment, Economic, and the Facilities and Services.

The Land Use Element addresses issues such as what land uses should be allowed in the various designations and the appropriate intensity of land use in various areas in the community.

The Community Character and Design Element consider roadway buffering, signs, rural character but mainly focuses on rural commercial design. The policies contained within the Community Character and Design Element encourages streetscape design, architectural design and sign design.

The Natural Environment includes consideration of the natural resources found on the Key Peninsula. Natural resources such as wildlife, clean water, forests, and open spaces are an integral and valued part of the community. The policies contained within the Natural Environment Element promote protection of critical areas, encourage preservation of natural vegetation, and address special topics such as the marine shorelines, wetlands, and fish and wildlife habitat.

The Economic Element looks at the economy of the Peninsula and considers several opportunities to provide the community with balance of employment and economic return with its impact to the rural character of the area. The most desirable growth would be for economic development through tourism relying on the Peninsula’s extensive inventory of parks, beaches and agricultural activities. More services are desired for local residents and tourists including civic uses, retail sales, and professional business in rural commercial areas.
The policies contained in the Key Peninsula Community Plan also promote home occupations and natural resource based business.

The Facilities and Services Element addresses the basic facilities needed to support planned development. Infrastructure includes capital facilities such as roads, trails, sewage disposal, parks, domestic water, stormwater control, electricity and natural gas. Services include solid waste disposal, fire protection, law enforcement, public schools, and library services. The policies within the Key Peninsula Community Plan identify the capital improvements that are necessary to support the community plan (septic, water, rest area, parks etc.) and discuss potential sources for funding the infrastructure and services.

The Plan Monitoring Section addresses how to measure the effectiveness and impacts of the plan over time.

**IMPLEMENTATION**

The plan also contains proposed actions, located at the end of each element, which serve to implement various plan policies. These actions are grouped into short-term, mid-term and long-term endeavors. Short term actions should occur immediately or within one year of plan adoption. Mid-term actions should be completed within 1-5 years. Long term actions should be completed within 5-10 years of plan adoption. The party or parties responsible for leading the effort to complete the action item is listed in parenthesis following the action. Actions are assigned to a lead entity or entities as the primary responsible party to complete.

**VISION STATEMENT**

The Key Peninsula Community Plan will provide its citizens, business owners, and government officials with a strategy to guide growth and development. This 20-year plan should promote the best aspects of rural living. In keeping with the desires of the majority of its citizens and without depriving landowners the reasonable use of their land, the community plan should:

- Promote a small town, socially connected community dominated by a rural landscape;
- Preserve the characteristics of the community including its unique marine attributes, history of each distinct community, and agricultural and forest lands;
- Safeguard the natural environment;
- Protect private property rights;
- Promote development that is planned, orderly, and connected with compact rural business centers serving the needs of the community;
- Encourage economic development and the creation of local jobs in a rural context;
- Require that infrastructure and services be provided or planned as development and growth occur; and
- Require that infrastructure and services be provided or planned to promote specific types of development and growth in designated areas.
Chapter 2: Land Use Element

INTRODUCTION

The Land Use Element of the Key Peninsula Community Plan provides policies regarding the location of preferred land uses (residential, commercial, resource lands, etc.) and the density or intensity related to those uses (i.e., how many dwelling units are permitted, how big structures can be, etc.). This element serves to refine the policies contained in the Pierce County Comprehensive Plan. The community plan provides more specific guidance and criteria regarding land uses than is provided in the generalized Pierce County Comprehensive Plan. In cases where this plan does not provide specific guidance, the policies in the Pierce County Comprehensive Plan shall be used to determine land use objectives and standards. The policies contained in this element provide the foundation for changes to the County’s Development Regulations including the zoning maps and codes.

DESCRIPTION OF CURRENT CONDITIONS

The Key Peninsula is characterized by a variety of rural land uses on large lots. Residential home sites, agricultural lands, and forest lands dominate the land use pattern. State Route 302 crosses through the northern portion of the community. Several small commercial areas are located along this state highway. Additional commercial areas are located south of SR 302 at Key Center, Home, and Longbranch. Several recreational campgrounds including two state parks are located along the extensive marine shorelines that surround the Peninsula. Many residents work locally in home businesses or in small retail stores in the commercial areas that cater to residents and tourists. However the majority of residents commute out of the plan area for jobs in the surrounding urban areas.

EXISTING LAND USES

The Pierce County Assessor-Treasurer’s Office classifies how parcels are used for purposes of calculating assessed value for taxation. The Pierce County Planning and Land Services Department routinely uses this information to determine the distribution of land uses within specific areas. The Assessor’s information is known to periodically contain errors, but is considered accurate for planning purposes. The Assessor’s information reflects only how land is currently being used and does not reflect zoning.

The following table summarizes the current uses of land on the Key Peninsula based upon Assessor-Treasurer’s information:

Currently Comprehensive Plan Designations and Zoning Classifications

The Pierce County Comprehensive Plan established four land use designations within the community plan area.

The following table summarizes the land use designations and zoning classifications prior to adoption of the community plan in terms of acreage and percent of plan area.

**Rural Ten (R10)**

The Rural Ten (R10) designation provide for a range of low density residential uses. The intent is to accomplish a rural land use pattern that promotes rural uses, while not requiring urban level services. Cluster development is encouraged within rural residential designations and zones and density bonuses are provided within developments for the dedication of permanent open space. One accessory dwelling unit is also allowed on a residential lot where an existing single-family dwelling exists. The designation and zone number (e.g., 10) represents the base number of acres required for each primary dwelling unit. The R10 designation accounts for 35,420 acres of land, totaling approximately 92% of the plan area.

**Agriculture Resource Land (ARL)**

Agricultural Resource Lands (ARL) are distinct from rural lands and include agricultural lands that have been designated as having long-term commercial significance. The Comprehensive Plan identifies criteria and guidance for protection, management, and future development of lands designated Agricultural Resource Lands. The key criterion for defining Agricultural Resource Lands is the presence of the County’s most productive agricultural soil types and their associated production yield. The ARL designation accounts for 2,874 acres of land, totaling approximately 8% of the plan area.

**Rural Activity Center (RAC)**

The Rural Activity Center (RAC) designation provide areas where residents can gather, work, shop, and entertain and tourists traveling to recreation areas can obtain needed services. A broad range of commercial, service, and residential uses is envisioned within a RAC. These areas should have immediate access onto state routes or major arterials and should be configured to provide an alternative to the strip development typically found along these types of road systems. There are two RACs within the plan area; one located at Lake Kathryn near the intersection of SR 302 and 94th Avenue and the other at Key Center near the intersection of Olson Drive and the Key Peninsula Highway. The RAC designation accounts for approximately 153 acres of land, totaling less than one percent of the plan area.

**Rural Neighborhood Center (RNC)**

The Rural Neighborhood Center (RNC) designation serves the everyday needs of local rural residents. The RNC provides limited convenience shopping and services, is limited in size, and retains a scale and intensity that is appropriate for maintaining the rural character. The five Rural Neighborhood Centers are located at SR 302 and 118th Avenue, SR 302 and Wright Bliss Road, Key Peninsula Highway and 134th Avenue, Home, and Longbranch. The RNC designation accounts for approximately 101 acres of land, totaling less than one percent of the plan area.

**Dwelling Unit Capacity**

Under pre-community plan zoning, it is estimated that a maximum total of 29,533 acres of vacant and underdeveloped land is currently available for residential use on the Key Peninsula.
These lands have the capacity to accommodate approximately 7,621 dwelling units based upon the housing densities allowed in each zone. It is estimated that 20,386 persons would be accommodated within this housing (based on an average of 2.675 persons per household). In addition, each residential lot may accommodate an accessory dwelling unit. Accessory dwelling units are not included in residential capacity calculations.

**Commercial Area Capacity**

There are seven rural commercial centers within the plan area. The commercial centers will be retained as a result of the community plan. Rural Activity Centers are located at Lake Kathryn and Key Center. The five Rural Neighborhood Centers are located at SR 302 and 118th Avenue, SR 302 and Wright Bliss Road, Key Peninsula Highway and 134th Avenue, Home, and Longbranch.

The following table provides information on the size and basic land use activity in each rural commercial center based on the Pierce County Assessor-Treasurer’s records from May, 2005. This table shows the amount of commercial development, underdeveloped land and vacant land in each center.

*Land area statistics are based on Pierce County Assessors Information - May 2005

**Acreage figures have been rounded to the nearest whole number.
DESCRIPTION OF DESIRED CONDITIONS

One of the most significant issues addressed within the community plan is land use. How land is utilized within a community directly affects the community’s character and quality of life perceived by its residents. The land uses within the plan area should reflect a rural character while providing opportunities for local employment and tourism. Agriculture is very important to citizens within the community and the land area designated as rural farm or agricultural resource land has been increased to more accurately reflect current farming and agricultural activities taking place across the plan area. Similarly, lands designated for park and recreation have been identified to encourage tourism and serve the recreational needs of local residents. A Rural Sensitive Resource designation will be implemented in selected areas of the open space network or where complex high value environmental features are inventoried. Finally, areas historically used for forest practices have been identified and designated for continued timber management in an effort to promote and encourage that use in appropriate locations. The following section describes in greater detail the proposed land use designations and zoning classifications as recommended in this plan.

PROPOSED LAND USE DESIGNATIONS AND ZONING CLASSIFICATIONS

The Key Peninsula Community Planning Board (CPB) analyzed a variety of information to recommend plan designations and zoning classifications on the Peninsula. First, limited areas of more intense rural development (LAMIRD) criteria were utilized to designate commercial areas (based on the Growth Management Act and Central Puget Sound Hearings Board decisions). Second, the Pierce County Comprehensive Plan policies for rural commercial areas and resource lands were evaluated. Third, existing land uses (based on the Pierce County Assessor tax records) were identified to designate rural farms, forest lands and park and recreation lands. Fourth, Pierce County’s Open Space Network and inventoried critical areas were used to identify property for Rural Sensitive Resource lands. Finally, individual landowner requests for rezones were considered at a series of community planning board meetings.

The CPB also developed hierarchy for designating future land use zones. This hierarchy was considered when a specific parcel of land contained several land uses, when the existing land use was different that the Pierce County Assessor information, or when the existing land use was different than the future land use envisioned by the CPB. The hierarchy or priority for designating zoning classifications was: First, designate commercial areas pursuant to LAMIRD criteria; next designate Agriculture Resource Lands, Park and Recreation, and Rural Farm areas pursuant to Pierce County Comprehensive Plan policies and the existing land use pattern; next, designate Rural Sensitive Resource lands based on the Pierce County Open Space Network and critical area inventory; and finally, all remaining lands were designated Rural 10.

One new land use designation and zone (Park and Recreation) will be added to the Pierce County Comprehensive Plan as a result of the Key Peninsula Community Plan. In addition to the new Park and Recreation zone, two new zoning classifications (Rural Farm and Rural Sensitive Resource) will be applied on the Key Peninsula. The following text, tables, and maps illustrate
the proposed changes in land use designations and zone classifications contained within the community plan and correlating acreage changes for each.

PROPOSED COMPREHENSIVE PLAN DESIGNATIONS AND ZONING CLASSIFICATIONS

The following table summarizes the proposed land use designations and zoning classifications in terms of acreage and percent of plan area.

RURAL TEN DESIGNATION AND ZONE

The Rural Ten (R10) designation primarily accommodates low-density single-family residential, agricultural, forestry, and recreational uses. Some types of civic uses and recreational uses, such as parks and trails, are also permitted in this designation. Home occupations are encouraged as an accessory use to a single-family dwelling unit. The residential densities within the R10 are one dwelling unit per 10 acres with a bonus density of two dwelling units per 10 acres when 50% of the property is set aside as open space. Existing parcels that are less than 10 acres and are zoned R10 can be built upon as long as other development criteria such as septic, water, critical areas, and other County requirements are met. Approximately 24,794 acres of the plan area have been designated R10. This represents 64% of the total plan area. The Rural Ten zoning classification implements this plan designation.

RURAL SENSITIVE RESOURCE DESIGNATION AND ZONE

The Rural Sensitive Resource (RSR) designation includes those properties designated as open space on the Pierce County Open Space Corridor map or associated with inventoried critical areas (specifically high value, complex environmental features such as wetlands and stream systems). This designation is intended to protect surface waters, aquifers, and fish and wildlife habitat from degradation. Incentives will be available for providing permanent protection of environmental features. For example, residential densities are one dwelling unit per 10 acres but a bonus density of two dwelling units per acres is permitted when 50% of the property is designated as permanent open space. New development within the RSR shall utilize low impact development techniques and the properties located within this designation are...
considered a high priority for community open space preservation and acquisition efforts. Approximately 8,398 acres of the plan area have been designated RSR. This represents 22% of the total plan area. The Rural Sensitive Resource zoning classification implements this plan designation.

**Rural Farm Designation and Zone**

The Rural Farm (RF) designation includes properties which are currently being used for or have historically been used for farming activities or have been previously zoned agriculture and that are not currently designated as Agricultural Resource Land (ARL). This new RF designation is intended to recognize properties that are suited for or are conducting agricultural activities within the community but may not meet the soils or parcel size criteria for designation as ARL. A variety of agricultural-related uses are allowed within this designation as well as the protections and incentives afforded to ARL. Densities within this designation are limited to one dwelling unit per 10 acres. Approximately 2,325 acres of the plan area have been designated RF. This represents 6% of the total plan area. The Rural Farm zoning classification implements this plan designation.

**Agricultural Resource Land Designation and Zone**

The Agricultural Resource Land (ARL) designation is intended to preserve parcels that contain prime agricultural soils for long-term agricultural activities. These properties are identified through a Countywide process. The criteria that are evaluated to implement this designation will stay the same as is currently established through the Pierce County Comprehensive Plan. This designation allows for a variety of agricultural uses. Approximately 512 acres of the plan area have been designated ARL. This represents one percent of the total plan area. The Agricultural Resource Lands zone implements this plan designation.

**Park and Recreation Designation and Zone**

The Park and Recreation (PR) designation has been established through the Key Peninsula Community planning process. This new designation was created in response to the community's desire to promote recreational activities and encouraging economic development through tourism. The designation is intended to simplify the permitting process for parks. The various types of existing park and recreation facilities as well as undeveloped public lands that should be reserved for future parks have received this Park and Recreation designation. It is assumed that existing uses such as commercial forest practice activities will continue on some of the properties designated for parks until such time as landowners choose to sell or transfer the land to a park and recreation provider. Approximately 2,287 acres of the plan area have been designated PR. This represents 6% of the total plan area. The Park and Recreation zone implements this plan designation.
**Rural Activity Center**

The Rural Activity Center (RAC) designation provide areas where residents can gather, work, shop, and entertain and tourists traveling to outlying recreation areas can obtain needed services. There are two RACs within the plan area; one located at Lake Kathryn near the intersection of SR 302 and 94th Avenue and the other at Key Center near the intersection of Olson Drive and the Key Peninsula Highway. An analysis of each commercial area on the Peninsula was conducted as part of the community planning process. The logical outer boundary of each commercial area was inventoried. This inventory was based on the built environment as of July 1, 1990. Similarly, the type of uses existing in each commercial area on July 1, 1990 was identified. Based on this information, the boundaries of the commercial areas and types of uses permitted within the RACs have been refined. The RAC designation accounts for approximately 159 acres of land, totaling less than one percent of the community. The Rural Activity Center zone implements this plan designation.

**Rural Neighborhood Center**

The Rural Neighborhood Center (RNC) designation serves the everyday needs of local rural residents. The RNC provides limited convenience shopping and services, is limited in size, and retains a scale and intensity that is appropriate for maintaining the rural character. The five Rural Neighborhood Centers are located at SR 302 and 118th Avenue, SR 302 and Wright Bliss Road, Key Peninsula Highway and 134th Avenue, Home, and Longbranch. An analysis of each RNC area on the Peninsula was conducted as part of the community planning process. The logical outer boundary of each area was inventoried. This inventory was based on the built environment as of July 1, 1990. Similarly, the type of uses existing in each commercial area on July 1, 1990 was identified. Based on this information, the boundaries of the commercial areas and types of uses permitted within the RNCs have been refined. The RNC designation accounts for approximately 130 acres of land, totaling less than one percent of the community. The Rural Neighborhood Center zone implements this plan designation.

**Community Plan Development Potential**

The total breakdown of vacant and underdeveloped lands under current zoning and the community plan zoning is described in the following table:

<table>

Pierce County Comprehensive Plan | Key Peninsula Community Plan G-28
Under the zoning adopted through the community plan process, the Key Peninsula has the capacity for approximately 7,285 dwelling units. This is 336 fewer units than could have been constructed under pre-community plan zoning. It is estimated that 19,787 persons could be accommodated by this housing, approximately 900 fewer residents than under pre-community plan zoning. The associated housing density of new residential growth would equate to .25 dwelling units per acre (not including potential accessory dwelling units or senior housing). This maximum dwelling unit capacity is higher than one would expect for an area zoned for one dwelling unit on 10 acres. The higher capacity is based on the large number of parcels on the Key Peninsula that are smaller than 7.5 acres which can accommodate a new single-family dwelling unit as well as an assumption that parcels that are eligible for subdivision will be divided at some point in the future for new housing.

The size of rural commercial areas will increase under the community plan. The Rural Activity Center at Key Center will increase in size by over four acres to a total of approximately 97 acres. The Rural Activity Center at Lake Kathryn will not change. The Rural Neighborhood Center at SR 302 and 118th Avenue will increase in size by over two acres to a total of approximately 30 acres. The Rural Neighborhood Center at SR 302 and Wright Bliss Road will increase by over 14 acres to a total of approximately 30 acres. The Rural Neighborhood Center at Key Peninsula Highway and 134th Avenue will increase by one acre to a total of approximately 37 acres. The Rural Neighborhood Center at Home will increase by over nine acres to a total of approximately 18 acres.

OTHER LAND USE CONSIDERATIONS

AQUACULTURE

The Key Peninsula has extensive marine shorelines containing high bluffs, bays and lagoons, sand spits, mud flats, sandy beaches, and many other features. These shoreline areas have historically offered locations for aquaculture, primarily the cultivation of oysters. Recently geoduck farmers have discovered that certain tidelands provide prime habitat for the cultivation of their product. This new aquaculture industry has the potential to create land use conflicts with upland home owners as the beaches used for geoduck farming are altered during
the initial stage of the young geoducks lifecycle. Hundreds of tubes that are used to protect the geoduck protrude out of the sand and create a visual impact at low tide as well as inhibit the ability of people to walk on the beach through the farm. The community planning board chose to encourage aquaculture activities throughout the Key Peninsula provided that farmers utilize best management practices and mitigate impacts to the environment and upland property owners.

**MASTER PLANNED RESORTS**

Master Planned Resorts have been identified as a preferred use in the community. These resorts have the potential to provide needed employment for Peninsula residents. The CPB considered these facilities an opportunity to increase tourism throughout the community which in turn would create prospects for other businesses. Based on the extensive marine shorelines and close proximity to major urban centers, Master Planned Resorts located on the Key Peninsula would have a tremendous opportunity for success.

**NEW FULLY CONTAINED COMMUNITIES AND MAJOR INDUSTRIAL DEVELOPMENTS**

Several opportunities exist under the Growth Management Act (GMA) that could provide significant employment opportunities in rural areas. New Fully Contained Communities (NFCCs) and Major Industrial Developments (MIDs) outside of UGAs are two possibilities the CPB considered. Both possibilities have extensive standards under the GMA that would need to be satisfied prior to implementation. Land at the north end of the plan area has been identified as the most logical location for either development. This general location is based on the large undeveloped properties that could be available and the fact that the Washington State Department of Transportation is exploring a re-alignment of SR 302 near the Pierce County/Kitsap County border. Either type of development would be considered by the Key Peninsula Land Use Advisory Commission at a future date, once a new corridor is established for SR 302.

**LAND USE POLICIES**

**GOALS**

The land use pattern on the Key Peninsula is intended to provide a rural ambiance highlighted by the natural attributes of the area, including the extensive marine shorelines, native forests, and large areas of open space. New land uses will reflect this rural environment emphasizing residential home sites on large lots, and resource uses including working farms and forest practices. Commercial services for local residents and tourists will be provided in compact, well-designed commercial shopping areas.
**Rural Residential**

**GOAL KP LU-1** A rural area that is endowed with working farms, forests, and pastures throughout the countryside provides community identity. Strive for a community that has safe streets and neighborhoods. Recognize individual rural communities and maintain their distinct identities. Low density housing, open space, and resource land uses will be the prominent development pattern in the area.

**KP LU-1.1** Establish Rural Residential land use designations that maintain a low density rural land use pattern, preserve the rural character, encourage agricultural activities, and protect environmentally sensitive features within the plan area.

**KP LU-1.2** The majority of the plan area should be designated Rural Residential. Property that is not designated for parks and recreation, sensitive resource, agriculture resource, rural farm, or rural commercial centers shall be designated for Rural Residential land use.

**KP LU-1.3** Residential densities in the R10 zone shall be 1 dwelling unit on 10 acres.

**KP LU-1.3.1** Residential density may be increased in the R10 zone to 2 dwelling units on 10 acres when 50% of the parcel is designated as open space.

**KP LU-1.3.2** The minimum lot size in the R10 zone shall be 10 acres, except the minimum lot size may be reduced to 1 acre when 50% of the parcel is designated as open space and residential densities are increased.

**GOAL KP LU-2** Allow a variety of rural residential land uses in the R10 zone that are consistent with a rural lifestyle.

**KP LU-2.1** The dominant land use shall be detached single-family residences.

**KP LU-2.2** Permit resource uses (farms and forestry). Mineral extraction (gravel mines, etc.) shall be a conditional use.

**KP LU-2.3** Permit civic uses such as churches, educational facilities, and public safety services that can be supported by rural infrastructure.

**KP LU-2.4** Allow tourism facilities such as hotel and motel uses with up to 20 guest rooms in locations throughout the Peninsula as a conditional use. Where new lodging facilities are developed on shoreline locations, encourage provisions for public access to the shoreline. Limit such public access to the lodging facilities’ property.

**KP LU-2.5** Support the development of Master Planned Resorts that will provide local jobs. Where new resorts are developed on shoreline locations, provisions for public access to the shoreline should be encouraged. Such public access should be limited to the resort property.

**KP LU-2.6** Allow for limited commercial services that are compatible with the functional and visual character of the rural area and serve a need for residents living in the rural area. Examples include backhoe services, home maintenance services, and other types of contractor yards.
GOAL KP LU-3 Establish a Rural Farm zone to support an agricultural-based tourist economy throughout the Peninsula.

KP LU-3.1 Implement the Rural Farm zone on properties that have established agricultural uses as evidenced by participation in the current use farm and agriculture program, are conducting agriculture operations, or in cases where landowners request inclusion and demonstrate their intent to conduct agriculture operations.

KP LU-3.2 Permitted uses in the Rural Farm zone include all agricultural uses and the buildings necessary to conduct the farm uses. These uses may include orchards, processing and sales of products produced on the farm, and wineries. Farm uses shall be permitted outright and are not subject to special use permit requirements.

KP LU-3.3 Encourage direct marketing of agricultural products from Rural Farm properties. Farm stands and associated parking areas shall maintain a minimum setback of 50 feet from SR 302 and the Key Peninsula Highway, 25 feet from other roads, and 10 feet from other property lines. Farm stands and associated parking shall maintain a 50-foot minimum separation from residences on adjacent properties.

KP LU-3.4 Allow custom milling and forest products sales, accessory to a single-family home, consistent with criteria for home occupations.

KP LU-3.5 Residential density shall generally not exceed a maximum of 1 dwelling on 10 acres. Residential density may be increased to a maximum of 1 dwelling unit per 5 acres in a clustered residential development on properties 20 acres or more in size when 50% of the site remains in open space. The clustered development may not result in more than 10 lots per cluster. The open space area must be dedicated to agricultural use.

GOAL KP LU-4 Establish a park and recreation designation to recognize campgrounds, parks, and recreational areas.

KP LU-4.1 Zone all undeveloped County and state properties on the Key Peninsula for future park and recreational use.

KP LU-4.2 Recognize all existing public and private parks and campgrounds through a park and recreation land use zone.

KP LU-4.3 Encourage recreational activities throughout the community plan area for the benefit of local residents and to encourage tourism.

KP LU-4.4 Support the development of shoreline access points for boat launches, public docks and piers, beach walking, wildlife viewing, and other shoreline-dependent uses.

KP LU-4.5 Permitted uses include neighborhood and community parks, amusement and recreation uses, campgrounds, community centers, museums, performing arts facilities, caretaker residences, and similar uses. New regional parks shall be a conditional use.
KP LU-4.6 Discourage the conversion of recreational areas, campgrounds, and parks to other uses.

KP LU-4.7 Until such time as properties designated for park and recreation are owned or controlled by a park and recreation provider, residential uses and densities shall be the same as authorized in the R10 designation.

GOAL KP LU-5 Implement the Rural Sensitive Resource (RSR) designation within the open space network.

KP LU-5.1 The RSR zone should be implemented in those areas of the open space network that have complex, high value environmental features.

KP LU-5.2 Low impact development standards shall be required in the RSR zone. These standards are intended to afford flexibility in stormwater system design while providing the highest level of stormwater control to protect downstream property owners and promote groundwater recharge.

KP LU-5.3 Residential densities and permitted uses shall be the same in the RSR designation as the R10 designation. When bonus density provisions are utilized, dedicate the required open space on the portion of the site that provides the greatest protection of environmental features.

KP LU-5.4 Encourage uses that do not involve significant buildings or impervious surfaces such as farming and forestry.

GOAL KP LU-6 Encourage home occupations and cottage industry.

KP LU-6.1 Allow home occupations and cottage industry in all zones as accessory use to a residence. All business activities shall be clearly secondary to the residential use of the site.

KP LU-6.2 Signs advertising home occupations or cottage industry shall be located on-site and shall be limited to one 8-square-foot business sign. Authorize off-site signs providing directions to home occupations and cottage industry when consistent with community plan design standards.

KP LU-6.3 Provide flexibility in the type of businesses permitted as home occupations and cottage industry.

KP LU-6.4 Allow any business type that is not visually or audibly noticeable at or beyond the property boundary.

KP LU-6.5 Permit home-based contractor businesses with associated outdoor storage through a Cottage Industry II approval.

KP LU-6.6 Separate cottage industry requirements into urban and rural categories with different standards for each (i.e., less intensive requirements for rural areas that are more compatible with rural character).
RESOURCE LANDS

GOAL KP LU-7  Agricultural, forest, and mineral resource lands are an asset for Peninsula residents. These lands provide many benefits including employment opportunities, wildlife habitat, and a scenic landscape enjoyed by all. Utilize resource lands at sustainable levels to provide raw materials, value-added products, and jobs necessary for future generations.

GOAL KP LU-8  Promote agriculture and aquaculture activities throughout the community plan area.

   KP LU-8.1  Properties that meet the ARL criteria shall be designated ARL.

   KP LU-8.2  Landowners may request their property be designated ARL when soil type and yield are not present, but the land is utilized for commercial agriculture purposes.

GOAL KP LU-9  Encourage a variety of uses in the ARL designation that are consistent with and support the long-term viability of farming.

   KP LU-9.1  Encourage direct marketing of agricultural products from ARL properties. Farm stands and associated parking areas shall maintain a minimum setback of 50 feet from SR 302 and the Key Peninsula Highway, 25 feet from other roads, and 10 feet from other property lines. Farm stands and associated parking shall maintain a 50-foot minimum separation from residences on adjacent properties.

   KP LU-9.2  Allow custom milling and forest products sales, accessory to a single-family home, consistent with criteria for home occupations.

GOAL KP LU-10  Allow a variety of aquaculture activities (including shellfish farming, fish hatcheries, and associated processing facilities) in appropriate locations throughout the community.

   KP LU-10.1  Mitigate aquaculture activities to reduce visual and noise impacts to nearby residences.

   KP LU-10.2  Implement best management practices for all aquaculture activities.

GOAL KP LU-11  Recognize forestry uses as a historical and desirable land use within the plan area.

   KP LU-11.1  Encourage a variety of uses in the Rural Residential designations that are consistent with and support the long-term viability of timber management.

   KP LU-11.2  Allow Christmas tree farms and the direct marketing of forest products associated with the holiday season. Tree stands and associated parking areas shall maintain a minimum setback of 50 feet from SR 302 and the Key Peninsula Highway, 25 feet from other roads, and 10 feet from other property lines. Farm stands and associated parking shall maintain a 50-foot minimum separation from residences on adjacent properties.

   KP LU-11.3  Allow custom milling and forest product sales on sites that engage in forest practice operations.
KP LU-11.4  To maintain the rural and forested character of the Peninsula and to promote tourism, discourage clearcuts adjacent to SR 302 and the Key Peninsula Highway.

KP LU-11.5  Require timber harvest methods that maintain the 50-foot-wide undisturbed natural buffer along SR 302 and the Key Peninsula Highway, or as an alternative, maintain tree density at 80 square feet of basal area per acre within a 100-foot-wide buffer.

RURAL CENTERS

GOAL KP LU-12  Compact and attractive Rural Activity Centers and Rural Neighborhood Centers serve as focal points for business and community activities. Plan these commercial centers in defined locations or in areas that have historically provided commercial services to the community. Encourage pedestrian features that present opportunities for citizens to walk between businesses. Commercial activities in rural centers should provide the basic goods, services, and employment needed by local residents.

KP LU-12.1  Prohibit rural commercial areas from sprawling along SR 302 and the Key Peninsula Highway.

KP LU-12.2  Designate rural commercial centers at Lake Kathryn and Key Center as Rural Activity Centers (RACs) based on their logical outer boundaries and consistency with other LAMIRD criteria.

KP LU-12.3  Rural Activity Centers are intended to provide the most intensive use of rural lands including opportunities for employment, shopping, civic services, and housing. Additional uses are appropriate in RACs when consistent with LAMIRD criteria.

KP LU-12.3.1  Analyze Rural Activity Centers to determine the land use intensity and types of business existing in each center on July 1, 1990 for consistency with criteria for LAMIRDs.

KP LU-12.3.2  Permitted uses in RACs based on 1990 business types include sales of general merchandise, food stores, motor vehicle repair, horticultural nursery, professional offices, vehicle salvage and storage, taverns, rental and repair services, public safety services, community services, metal products fabrication, building material and garden supply stores, and multifamily dwelling units.

KP LU-12.4  Authorize new civic and commercial uses in RACs that can be supported by rural facilities and services and that encourage a rural tourism economy. Uses in RACs should provide the basic goods and services for rural residents and tourists.
Examples of uses permitted in RACs to serve the everyday needs of rural residents and tourists include senior housing, nursing homes, education facilities, health services, postal services, religious assembly, transit services, agricultural products and supply sales, amusement and recreation uses, gas stations, restaurants, personal services, motels, farmers markets, and small-scale manufacturing and assembly uses.

Designate rural commercial centers at SR 302 and 118th Avenue, SR 302 and Wright Bliss Road, SR 302 and 134th Avenue, Home, and Longbranch as Rural Neighborhood Centers (RNCs) based on their logical outer boundaries and consistency with other LAMIRD criteria.

RNCs are intended to provide limited commercial services for residents and tourists. Additional uses are appropriate in RNCs when consistent with LAMIRD criteria.

Analyze RNCs to determine the land use intensity and types of business existing in each center on July 1, 1990 for consistency with criteria for LAMIRDs.

Permitted uses in RNCs based on 1990 business types include sales of general merchandise, food store, restaurant, contractor yard, motor vehicle repair, gas station, daycare, building materials and garden supply, church, laundry facilities, post office, and marina.

Authorize new civic and commercial uses in RNCs that can be supported by rural facilities and services and that encourage a rural tourism economy. RNCs should provide limited goods and services for rural residents and tourists.

Examples of uses permitted in RNCs to serve the everyday needs of rural residents and tourists include senior housing, religious assembly, public safety services, transit services, agricultural products and supply sales, amusement and recreation uses, personal services, and farmers markets.

Develop a process for rural industrial developments to provide local employment opportunities for Peninsula residents consistent with LAMIRD criteria.

The designation of land for industrial developments should be considered by the Key Peninsula Land Use Advisory Commission once the Washington State Department of Transportation selects a corridor for realigning SR 302 north of Burley Lagoon consistent with LAMIRD criteria.

Consider designating land near the Kitsap County line adjacent to one of the north-south arterial roads which would connect with newly aligned SR 302 for Rural Industrial Center consistent with LAMIRD criteria.
KP LU-13.3 Mitigation of environmental impacts associated with such development shall be determined through a planned action. Identification of potential uses shall be disclosed in the application. Review of environmental impacts shall include impacts to local aquifers, transportation systems, air and water quality, resource lands, and compatibility with adjacent rural residential uses.

KP LU-13.4 Any industrial areas shall be developed consistent with provisions for such uses described in the Washington State Growth Management Act, Countywide Planning Policies, and the Pierce County Comprehensive Plan. Necessary infrastructure shall be planned for and provided. Critical Area Regulations shall be met.

IMPLEMENTING ACTIONS

The following list of actions needs to be completed in order to implement the policies contained within this plan. They are arranged according to the timeframe within which each should be completed: short, medium, or long term. Short-term actions should occur within one year of plan adoption. Mid-term actions should be completed within 1-5 years. Long-term actions should be completed within 5-10 years of plan adoption. The entity or entities responsible for leading the effort to complete the action item is listed in parenthesis following the action. Actions are assigned to the Land Use Advisory Commission (LUAC), Pierce County Planning and Land Services (PALS), Pierce County Economic Development (ED), Pierce County Parks and Recreation (Parks), Pierce County Public Works & Utilities (PWU), Tacoma-Pierce County Health Department (TPCHD), Pierce County Assessor, Pierce Conservation District (PCD), Key Peninsula Community Councils, and the Key Peninsula Business Association.

SHORT TERM ACTIONS (UPON PLAN ADOPTION TO 1 YEAR)

1. Amend the Pierce County Comprehensive Plan to adjust land use designations according to plan policies and maps. (PALS)
2. Amend the Pierce County Comprehensive Plan to:
   - Establish a Park and Recreation designation. (PALS)
   - Revise land use designations and maps consistent with the adopted community plan. (PALS)
3. Amend the Pierce County Development Regulations – Zoning (Title 18A) to:
   - Establish allowed uses in the various rural residential zone classifications consistent with community plan policies. (PALS)
   - Establish allowed uses in ARL classification consistent with community plan policies. (PALS)
   - Establish allowed uses in rural commercial zone classifications consistent with community plan policies and LAMIRD criteria. (PALS)
   - Establish densities and dimensions for the various zone classifications. (PALS)
   - Update development standards relating to the forested buffer adjacent to SR 302 and the Key Peninsula Highway. (PALS)
• Provide standards that support the development of Master Planned Resorts. (PALS)

2. Amend the Pierce County Zoning Atlas to adjust the zones for the community plan area including the zone classifications that are new to the Key Peninsula including Rural Sensitive Resource, Rural Farm, Park and Recreation. (PALS)

3. Amend the Pierce County Zoning Atlas to adjust the rural commercial zones consistency with community plan policies and LAMIRD criteria. (PALS)

4. Amend the Pierce County Development Regulation - Sign Code (Title 18B) to increase the size of signs for permitted home occupation and cottage industries. (PALS)

5. Amend the Pierce County zoning code and Stormwater Management and Site Development Manual to require low impact development techniques be implemented for development in the Rural Sensitive Resource zone. (PALS, PWU)

6. Amend the Pierce County Development Regulations – Critical Areas (Title 18E) to require fish and wildlife assessment for aquaculture activities in locations designated as “marine shoreline critical salmon habitat” areas. (PALS)

7. Establish a Key Peninsula Land Use Advisory Commission. (PALS)

**Mid-Term Actions (1-5 Years)**

1. Streamline the permitting process for land use activities in parks. (PALS)

2. Develop an inventory of potential shoreline access points. (PALS, Parks, PWU, LUAC)

3. Amend home occupation and cottage industry regulations to distinguish between urban and rural development standards. (PALS, LUAC)

4. Amend the Pierce County Shoreline Management Use Regulations (Title 20) to require best management practices for aquaculture activities. (PALS, LUAC)

5. Update the Pierce County Shoreline Master program to allow a variety of aquaculture activities. (PALS, LUAC)

6. Update Development Regulations – Natural Resource Lands (Title 18I) to revise property notification standards for new construction and development adjacent to resource uses (PALS)

**Long Term Actions (5-10 Years)**

1. Develop a process for establishing New Fully Contained Communities (RCW 36.70A.350) or Major Industrial Developments (RCW 36.70A.365) to provide local employment opportunities for Peninsula residents. (PALS, LUAC)

Chapter 3: Community Character and Design Element

Introduction

The Community Character and Design Element relates to the physical environment that composes the character of a community: the streets, parks, buildings, neighborhoods, and open space that determine the way our community looks and feels. It is a blending of land use planning, architecture, landscaping, and environmental protection. Community design looks at the way buildings, streets, public places, signs, natural features, and other development relate to one another and the people who use them. Through community design, improvements such as street construction, park development, commercial, residential, and civic development can be effectively coordinated to promote a unified community image. Design directly affects community and neighborhood livability, and overall quality of life. The community character policies are intended to reinforce the aesthetic characteristics that the community wants to retain and build upon. They are intended to enhance the image the community would like to portray to its own residents and visitors.

The residents of the Key Peninsula are interested in preserving the rural character of their community. The development which has occurred over the past 100 years has retained much of the wooded, pastoral, and natural characteristics of the Peninsula. The seven rural commercial areas tend to have a rustic physical appearance which is typical of many rural commercial areas found throughout the Pacific Northwest. These features create a unique environment for community identity and pride. Residents have determined that a high priority should be given to recognizing and preserving the existing character of the area. The Community Character and Design Element emphasize the community's vision of economic development through tourism by setting forth goals and objectives related to the preservation of the historic development pattern and rural characteristics of the area. Good design invites human presence, allowing for interaction of people and recognizes the functional and visual links between developments. Poorly designed development tends to hinder the development of desired land uses, stifles the pedestrian use of an area, and often leads to future blighted areas. The community plan design standards are primarily focused on the rural commercial areas.

Description of Current Conditions

The Key Peninsula is considered rural with large lot home sites, farms, and working forests. Historically, several small commercial areas developed near saltwater bays where piers were constructed (Home and Longbranch) and at major road intersections (Key Center and Lake
Kathryn). The northeast portion of the Key Peninsula lying east of 134th Avenue was developed at what could be characterized as a suburban development pattern. This development occurred prior to the Washington State Growth Management Act (GMA) through the Gig Harbor Peninsula Comprehensive Plan (1975). Elsewhere, there are still many farms (both hobby farms and commercial farms) on the Peninsula and outdoor recreational opportunities exist at private and public parks adjacent to the saltwater shoreline. It is still common to see people riding horses or enjoying other types of outdoor recreational activities such as biking and boating. Views of the southern Puget Sound, Mt. Rainier, and the Olympic Mountains are prominent from many locations within the plan area and are often quite spectacular.

**RURAL RESIDENTIAL AREA**

The character of the Key Peninsula was historically influenced by the agricultural and forestry industries with a connection to marine transportation. Since the 1950s, the rural residential area has seen a steady increase in single-family residential development. A significant percentage of new homes were constructed exclusively as vacation retreats; however, that trend is changing as more people have chosen to live on the Peninsula and commute to jobs elsewhere. Several large residential developments were completed prior to the adoption of the GMA and those lots are suburban in character. There are also historical farmhouses in the rural residential area that were built around the turn of the century. Since the early 1990s, the majority of new residential construction has occurred on larger lots or on parcels near the shoreline. These new residential homes along the shorelines are typically large executive homes.

There are still many large, undeveloped parcels located throughout the Key Peninsula.

The agricultural and forested character of the area, together with the Peninsula’s location southwest of Purdy, creates a perception for the citizens of the rural area that their community is isolated from the big city. This perception is a reality in terms of transportation as the majority of the Peninsula is surrounded by water. Several large state parks are located on the Peninsula and many tourists from outside of the community come to the area to vacation, generally in the summer months.

**RURAL COMMERCIAL CENTERS**

There are various small communities located within the plan area. Some of these historical commercial areas such as at Vaughn and Herron have no commercial development remaining but are still considered rural centers by local residents. Most of these places were not designated for commercial zoning through the community plan and are not expected to develop with new businesses. Other slightly larger commercial areas have some existing commercial development and have met the criteria under GMA to be designated for rural
commercial zoning. These smaller rural commercial centers include Longbranch, Home, and the intersections of the Key Peninsula Highway and 134th Avenue, Wright-Bliss Road and SR 302, and 118th Avenue and SR 302. These commercial areas and have been designated as Rural Neighborhood Centers. The neighborhood commercial areas commonly contain several retail or civic structures such as a convenience store, gas station, contractor’s yard, or church. The largest commercial areas on the Peninsula are located at Key Center and Lake Kathryn. These areas have been designated as Rural Activity Centers and will be the focus for the majority of new commercial development on the Key Peninsula.

**Lake Kathryn Rural Activity Center**

Lake Kathryn is one of the two rural activity centers on the Key Peninsula. It is located several miles west of the City of Gig Harbor’s urban growth area. The center contains some of the larger retailers in the area and the only shopping center. The only franchise fast food restaurant in the community is located in the center as well. Other uses include a wrecking yard, post office, gas station, mini-storage, and tavern. Only 27% of the 58-acre commercial center is developed with commercial uses. Over 42 acres of the RAC is currently vacant. There is tremendous potential for further redevelopment within the interior of the center on the south side of the highway. The parking lot at the Lake Kathryn Village shopping center is landscaped and a sidewalk exists fronting several of the commercial uses. Much of the center is wooded and this natural vegetation could be incorporated into the landscaping plans for future development.

**Key Center Rural Activity Center**

Key Center is the largest commercial center on the Key Peninsula at 97 acres and is the location of many of the retail and service uses local residents require. Commercial uses include a grocery store, hardware store, doctor office, several taverns, and restaurants. Civic uses include a post office, public library, and the headquarters for the local fire district. The commercial area is centralized along Key Peninsula Highway with Olson/Cramer Road being the main intersection. Thirty-three percent of the commercial zoned area is improved with commercial or civic development. Thirty-eight percent of the commercially zoned land is vacant and available for new development. Further, much of Key Center is considered underdeveloped with 27% of the RAC area improved with single-family residences. Two apartment buildings utilize approximately two percent of the commercial area. Because of its central location, existing inventory of commercial and civic land uses and potential for new development, Key Center is expected to experience significant development in the future. Unfortunately, Key Center has no consistent design attributes between the various buildings. Further, there are very few pedestrian amenities that would encourage local residents or tourists to spend time shopping in the commercial district. Quality site planning and good building design would go a long way to promote economic development in Key Center.

**Wright-Bliss Rural Neighborhood Center**

Existing development of the Wright-Bliss RNC is minimal. Development is centered around the road intersection and includes a fire station, log home contractor, gas station, coffee shop, and
pet/farm supplier. The center is 30 acres total in size with 43% of the RNC developed with commercial uses. The majority of the center is underdeveloped or vacant. Due to the location of the center on SR 302, there is potential for future commercial activities to locate in the Wright-Bliss RNC. There are minimal pedestrian amenities or landscaping in the center.

### 118th Avenue Rural Neighborhood Center

The majority of commercially-zoned land at the 118th Avenue RNC consists of the Charboneau Excavating, Inc. properties. This 12-acre site amounts to nearly one half of the commercially zoned land in the center and is largely unimproved and has significant development potential. Other existing uses include the Ravensara Coffee Shop, a veterinary hospital, and several real estate offices. The center is a total of 30 acres. State Route (SR) 302 bisects the 118th Rural Neighborhood Center and provides excellent access for commuters and tourists. Minter Creek, a salmon stream, runs through the commercial center on the north side of the highway. There are minimal pedestrian amenities or landscaping in the center.

### 134th Avenue Rural Neighborhood Center

The 55-acre RNC at 134th Avenue sprawls along the Key Peninsula Highway from just south of the traffic signal at SR 302 south toward 139th Avenue. There are various retail uses established along the highway with 25% of the commercially zoned area improved with commercial or civic activities while 45% of the land is vacant. Fifteen percent of the area is considered underdeveloped and improved with single-family residences. The center has excellent access to the adjacent Key Peninsula Highway. Many of the tourists heading further south on the Peninsula will pass through the 134th Avenue RNC. There are minimal pedestrian amenities or landscaping in the center.

### Home Rural Neighborhood Center

Located at the junction of Key Peninsula Highway and Herron Road at Van Geldern Cove, Home is one of the earliest communities established on the Key Peninsula and has retained several commercial activities. The commercially zoned area at Home is approximately 18 acres. Commercial and civic developments in Home include a grocery store, gas station, restaurant, and post office. Forty five percent of the total acreage of the center is improved with commercial or civic uses. Approximately 25% of the total acreage of the commercial area (amounting to just over four acres) is vacant while 27% of the area is considered underdeveloped with single-family residential uses. There are minimal pedestrian amenities or landscaping in the center.

### Longbranch Rural Neighborhood Center

The Longbranch RNC is the smallest of the Key Peninsula commercial centers at 5.87 acres but is the only commercially zoned area on the Peninsula to have an operating marina. Based on the proximity of the marina, the Longbranch RNC has opportunities for new development associated with maritime activities and tourists. The RNC is also the most southerly located commercial area and serves a fairly large geographic area. Presently, the Longbranch RNC has
one acre of established commercial development (the Longbranch Mercantile) which is under repair. The balance of the commercially zoned land at Longbranch is either underdeveloped (existing single-family residence) or consists of vacant land. There is good potential for this center to flourish and thrive once redevelopment has occurred. The RNC could support a variety of commercial and retail uses.

**SIGNS**

Signs throughout the Key Peninsula lack any sense of consistent style or order. Many commercial buildings are plastered with random signage. The use and combination of sandwich boards, banners, blinking lighting, and temporary signage creates sign clutter that can be visually disturbing to traveling motorists and citizens who are shopping or using other services. Signs are also attached to trees, public utility poles, and fences outside of designated commercial areas. In some instances signs don’t match the businesses they intend to advertise, are made of unattractive materials/colors, contain information that is misspelled, or are in a state of disrepair (rusty, broken, ripped, outdated, etc.).

**HISTORIC AND CULTURAL RESOURCES**

Historically, settlements and commercial areas were located at places that provided easy access to the shoreline for transportation. Many of the communities throughout the plan area, such as Home, Herron, Glen Cove, Lakebay, Longbranch, Wauna, and Vaughn have considerable early history providing these functions.

Preservation and enhancement of special and unique features and places that relate to a community’s heritage can bring economic benefits to the community through stimulating investment, increasing visitors, and promoting tourism in general. A variety of historic preservation activities throughout a community can support the efforts for resource conservation and also help improve quality of life. Examples include restoration of an old farm house, reuse of a historic schoolhouse or wharf, rehabilitation of an old store and retaining its commercial use through compatible commercial additions, and incorporation of historic resources and landmarks into new recreational resources and facilities, including trails, or scenic bike or auto routes.

There are a number of federal, state, and local laws and programs that apply to historic and cultural resource preservation. Locally, the Pierce County Cultural Resource Inventory provides an indication of those properties or structures that may hold historical or cultural significance. Table G-6 and Map G-11: Historic Resources identify historic and cultural resources within the plan area. These resources include residences, schools, stores, hotels, post offices, farms with farm buildings, and cemeteries.

</table>
This inventory of historic and cultural resources is intended to be a preliminary list of sites with potential historical significance. Additional detailed site specific research is necessary in some cases to determine a property’s eligibility for listing in a historic register. Further, other sites may be added to this list in the future based on additional research.

**DESCRIPTION OF DESIRED CONDITIONS**

The policies in the Community Character and Design Element intend to promote a quality visual environment consistent with the community’s rural heritage. Development is intended to be consistent with the community plan theme of promoting economic growth by encouraging tourism. This will occur through superior site planning, excellent streetscape design, and architectural details that are traditional to the Pacific Northwest. The primary focus for implementation of design standards are within rural commercial areas. The policies typically rely on development incentives for successful completion.

**RURAL RESIDENTIAL AREAS**

Preservation of the farms, forests, natural areas, and undisturbed lands that have historically been associated with the rural area of the Peninsula creates the rural character that the community considers essential for promoting tourism. A visual corridor along SR 302 and the Key Peninsula Highway that reflects the forested characteristics of the Peninsula should be retained and enhanced. Agricultural uses and forest practice activities help sustain the rural character in the community. These resource land uses should be encouraged to continue. Buildings and sites of historical significance should be retained.

**RURAL COMMERCIAL CENTERS**

In December 2006 the CPB held a community design charette to explore the possibility of requiring design standards in the community. The charette was facilitated by BCRA, an architectural design firm, and Pierce County planning staff. Members of the CPB, realtors, the Key Peninsula Business Association, and the general public participated in the charette. A variety of recommendations were described as a result of the design charette intending to promote economic development through tourism. Reconstruction of the streets through the rural commercial areas was a major theme taken from the charette. Projects intended to slow traffic, encourage pedestrian circulation, and better identify each rural commercial center were considered a priority. It was recommended that new buildings and significant remodels of existing buildings provide a rural or rustic building appearance following concepts of traditional Pacific Northwest architecture. Many of these concepts were accepted by the Key Peninsula CPB and have been incorporated into community plan policy. Development incentives will facilitate compliance with design standards. The results of the design charette can be reviewed via CD in Appendix C.
**Lake Kathryn Rural Activity Center**

Gateway identification should be incorporated along SR 302 that will let travelers know they have entered the commercial center. Use of monument signage and traffic calming that will provide positive identification to the area is encouraged. Several pedestrian crossings in appropriate locations, a trail along the bottom of the steep slope on SR 302, and a signalized intersection will create a safer pedestrian environment. Campus style development is encouraged. This should include a mix of retail, commercial, and office uses with shared parking between uses. Duplex and townhouse style senior housing is encouraged in the center. Multifamily residential development should be considered as a component of any mixed use retail project. Boulevards along SR 302 could narrow the traveled way and force traffic to slow down. Buildings should be located close to street frontage to create a strong neighborhood street presence, character, and identity. Pocket parks or public commons throughout the center are encouraged. Pedestrian and bike access to a future Cushman Regional Trail is recommended. New buildings and the significant exterior remodel of existing buildings should provide a rural or rustic building appearance following concepts of traditional Pacific Northwest architecture.

**Key Center Rural Activity Center**

Gateway identification of the commercial center would be created by new retail development close to the intersections of the Key Peninsula Highway and Olson Road. A gateway monument sign would act as an entrance feature and create community identity. Existing retail use should be reinforced by new retail development located close to the Key Peninsula Highway frontage with new parking areas located behind new buildings. The new retail uses could be supported by an increase in density with future senior housing. This senior housing should be a mix of housing types. Multifamily residential development or office park development should be considered on the hill to the east of the retail core. Traffic calming and pedestrian friendly amenities are encouraged including a planted median on the Key Peninsula Highway, crosswalks, mid-block crossings (in appropriate locations), sidewalks, and roundabouts dispersed on side streets throughout the center. A public parking area for residents and tourists including RV parking, a public restroom facility, and tourist kiosk is recommended. New buildings and the significant exterior remodel of existing buildings should provide a rural or rustic building appearance following concepts of traditional Pacific Northwest architecture.

**Wright-Bliss Rural Neighborhood Center**

Building frontages should be located close to streets to create pedestrian-oriented retail uses while also calming traffic. This strong street presence is intended to create an identity to the center. Bulb-outs and street trees on SR 302 would narrow streets visually, creating additional traffic calming opportunities. Pedestrian accessibility should be increased. Pedestrians should be able to easily cross SR 302 with crosswalks. Pathways should be provided between buildings, the street and parking areas. Parking areas should be located behind new commercial buildings to reduce the need for pedestrians crossing potentially busy areas. Parking lots should be landscaping in an effort to break up the large parking areas.
buildings and the significant exterior remodel of existing buildings should provide a rural or rustic building appearance following concepts of traditional Pacific Northwest architecture.

**118th Avenue Rural Neighborhood Center**

Gateway identification markers should be placed along SR 302 at either end of the 118th Avenue RNC, allowing travelers early visual identification of the commercial center. Retail uses will be authorized close to SR 302 to create a pedestrian-oriented environment. Narrower streets with parallel parking and landscaping with street trees will create a visual barrier between public and private spaces and between pedestrians and vehicle traffic on SR 302. A roundabout at the intersection of 118th Avenue is recommended to calm traffic. The 118th Avenue and SR 302 intersection should be considered for realignment to allow for a safer right-angled intersection. Mixed-use buildings and retail with parking areas located behind would allow for safe movement of pedestrians between parking lots, buildings, and retail spaces. Pocket parks or public common space should be interspersed between retail and mixed-use buildings. Senior housing could be located behind retail/commercial uses, allowing residents to live in close access to retail uses. New buildings and the significant exterior remodel of existing buildings should provide a rural or rustic building appearance following concepts of traditional Pacific Northwest architecture.

**134th Avenue Rural Neighborhood Center**

Gateway identification signage should be located at either end of Key Peninsula Highway at the entrance to the 134th Avenue commercial center. Existing uses will remain and new retail uses should be placed close to the Highway with parking areas located behind buildings. Traffic calming measures, such as a roundabout at the intersection of the Key Peninsula Highway and 134th Avenue, together with a strong retail street presence by placing new buildings near the street will slow traffic in the center. Pedestrian features including walkways between businesses and crosswalks on the Key Peninsula Highway will encourage shopping. Public common space should be provided as a component of office and commercial developments. Senior housing could increase the population density of the center. The addition of a loop road on the east side of Key Peninsula Highway should be considered. New buildings and the significant exterior remodel of existing buildings should provide a rural or rustic building appearance following concepts of traditional Pacific Northwest architecture.

**Home Rural Neighborhood Center**

Gateway identification signs are recommended at either end of the Home RNC along Key Peninsula Highway. These signs should be designed to create an identity or image for the Home commercial district. Community identity would be further reinforced by unified design features such as street trees, curbs, gutters and sidewalks. Parallel parking should be considered along the highway. These features will also contribute to calming the traffic by defining the street edge. Wide sidewalks with street lighting and parking along the water (Herron Road and A Street) would create a tourist focal point. Road intersections should be strongly defined with pedestrian crossings. Bulb-outs, redirected road intersections, and crosswalks would promote vehicular and pedestrian safety. New buildings and the significant
exterior remodel of existing buildings should provide a rural or rustic building appearance following concepts of traditional Pacific Northwest architecture.

LONGBRANCH RURAL NEIGHBORHOOD CENTER

Gateway signs are proposed at either end of the center to mark the entrance to the RNC at Longbranch. Transportation and traffic calming improvements are recommended including a pedestrian crossing between the retail area on the west side of the Key Peninsula Highway with the wharf and marina. Pavement changes at the crosswalks, curbs, gutters, sidewalks, planting strips all would contribute to a pedestrian friendly, safe and inviting environment. These improvements would also narrow and define the street and give travelers visual interest while promoting the commercial center for tourists. A maritime-themed shopping and activity center, located behind the existing buildings on Key Peninsula Highway, is recommended to provide additional services and tourist activities. Street trees, lighting, and pedestrian amenities will augment a boardwalk feature recommended for the east side of Key Peninsula Highway and which could provide access to the beach. New buildings and the significant exterior remodel of existing buildings should provide a rural or rustic building appearance following concepts of traditional Pacific Northwest architecture.

SIGNS

New signs should be constructed of natural materials or have natural appearing facades and shall be designed and placed in a manner to enhance the scenic atmosphere of the Key Peninsula. Simple wooden signs with engraved, painted, vinyl, or stained lettering are more desirable than plastic, internally lit signs. Signs should be maintained in a high-quality condition. Most signs should be installed in rural commercial areas associated with permitted businesses; however, community information signs, home occupations, and tourism signs should be permitted throughout the community when uniform sign design standards are established.

CULTURAL RESOURCES POLICIES

GOAL KP CR-1 Protect the existing historical and cultural resources that help to maintain the rural identity of the Key Peninsula.

KP CR-1.1 Protect or preserve buildings and sites of historical significance throughout the Key Peninsula.

KP CR-1.2 Encourage all development within the Home Historic District to follow the guidelines for construction contained in the Home, Washington Historic District Design Manual.

KP CR-1.3 Encourage protection and preservation of recognized landmarks and buildings through a variety of incentives aimed at rehabilitation or restoration.
KP CR-1.4  Encourage a diverse mix of rural architecture that currently characterizes the plan area.

**DESIGN AND CHARACTER POLICIES**

**GOALS**

The design character within rural commercial areas is represented by rural and rustic building concepts reflecting traditional Northwest architecture. Timber-framed buildings with extensive use of stone or brick highlight the desired exterior appearance of new civic and commercial buildings. Rural commercial centers should be designed to promote pedestrian circulation and slow vehicular traffic to enhance the quality of life for local residents and to attract tourists. Throughout the Peninsula, all development should be designed to emphasize the natural landscape including the extensive marine shorelines, native forests, and large areas of open space.

**COMMUNITY CHARACTER**

**GOAL KP D-1**  Development should be conducted in a manner that preserves and enhances the existing natural beauty of the Key Peninsula. Existing places of historic and cultural significance should be protected. Encourage new buildings that are representative of the rural character of the area.

**GOAL KP D-2**  Support methods to retain the natural beauty and scenic atmosphere of the Key Peninsula.

- **KP D-2.1**  To maintain the rural and forested character of the Peninsula and to promote tourism, discourage clearcuts adjacent to SR 302 and the Key Peninsula Highway.

- **KP D-2.2**  Require timber harvest methods that maintain the 50-foot-wide undisturbed natural buffer along SR 302 and the Key Peninsula Highway, or as an alternative, maintain tree density at 80 square feet of basal area per acre within a 100-foot-wide buffer.

- **KP D-2.3**  Require design standards for commercial activities located outside of rural commercial areas including design standards for home occupations and cottage industries.

- **KP D-2.4**  Require that automobile repair businesses conduct the repair activities inside a building or totally screen the activities from adjacent residential uses.

- **KP D-2.5**  Require that all commercial business activities that include outdoor storage be screened from view from adjacent residential uses. Screening may include fencing or landscaping screens of native vegetation. This policy is not intended to apply to agricultural resource uses.
RURAL COMMERCIAL DESIGN

GOAL KP D-3  Design and develop the seven rural commercial areas on the Key Peninsula to maximize economic development opportunities. Design each rural commercial area to attract additional businesses, tourists, and local residents. Automobile traffic should be slowed and pedestrian amenities should be constructed. Design buildings following traditional Northwest architectural styles.

GOAL KP D-4  Support the development of streetscape improvements within rural commercial centers that will encourage economic development.

KP D-4.1  Implement traffic calming techniques within rural commercial centers.

KP D-4.1.1  Authorize a variety of techniques including landscape medians, roundabouts, bulb-outs, and other methods of slowing the traffic flow in rural commercial centers. Emphasis should be given to Key Center and Home rural commercial areas.

KP D-4.1.2  Consider the installation of on-street parking including parallel or angle parking based on the unique circumstances of each commercial center.

KP D-4.2  Implement pedestrian-friendly design features that will encourage safe pedestrian circulation within the road right-of-way in rural commercial centers.

KP D-4.2.1  Support the installation of curbs, gutters, and sidewalks, multi-use trails, and paths along public and private roads.

KP D-4.2.2  Support the construction of pedestrian crossings at road intersections and mid-block crossings with refuge areas as appropriate. A variety of techniques including stamped concrete, colored pavers, and striping should be considered for pedestrian crossings.

KP D-4.2.3  Allow pedestrian amenities within the County road right-of-way such as lighting standards, street trees, landscaping, and benches.

KP D-4.3  Explore a variety of sources to fund streetscape improvements. Consider funding sources such as local improvement districts, developer contributions, federal, state, and local grant opportunities, and public investment.

KP D-4.4  Encourage the development of gateway identification markers at entrances to rural commercial centers. Gateway improvements are intended to create a sense of arrival when entering a commercial district.

KP D-4.5  Provide incentives for property owners to follow low impact development techniques for new development.

GOAL KP D-5  Encourage development of pocket parks and public common areas within rural commercial centers.

KP D-5.1  Pursue opportunities for public investment to provide pocket parks within rural commercial areas.
KP D-5.2 Utilize development incentives as a method for achieving a ratio of public common space or outdoor gathering space based on development intensity and use.

KP D-5.3 Orient outdoor gathering space to maximize sun exposure and view opportunities.

GOAL KP D-6 Implement design features that will encourage pedestrian circulation within rural commercial centers.

KP D-6.1 Encourage the installation of pedestrian pathways between buildings and through parking lots.

KP D-6.1.1 Incorporate pedestrian pathways within proposed developments, and between buildings with connections to the public sidewalk or public road right-of-way.

KP D-6.1.2 Identify pedestrian pathways through use of raised walkways or changes in pathway materials or texture, landscaping, and lighting.

KP D-6.2 Integrate new development with existing developments through strategic placement of landscaping, connected parking, and pedestrian pathways.

KP D-6.3 Provide lighting at a pedestrian scale and directing it downward. Provide incentives that encourage lighting around parking lots and buildings. Lighting should provide an adequate amount of illumination to provide a feeling of safety; however, avoid lighting standards that light up large areas with a single light source.

KP D-6.4 Promote the use of native, drought-tolerant vegetation in landscaping applications.

KP D-6.4.1 Incorporate existing trees and other native vegetation in landscaping areas whenever possible.

KP D-6.4.2 Require landscaping within and around parking lots. Provide incentives for innovative stormwater control facilities such as rain gardens and bioretention facilities.

KP D-6.4.3 Encourage landscaping that does not depend on irrigation.

KP D-6.4.4 Landscaping within road medians or at road intersections shall consist of low-growing shrubbery or other vegetation that does not impair a driver’s vision or sight distance.

GOAL KP D-7 Promote the improvement of compact nodes of commercial development which will create a strong sense of community identity and will encourage use by local residents and tourists.

KP D-7.1 Encourage developers to construct new buildings within rural commercial centers close to the street with parking facilities located behind the buildings.

KP D-7.1.1 Support the placement of corner accent buildings at road intersections.

KP D-7.1.2 Authorize construction of new buildings in rural commercial centers with zero setbacks from the road right-of-way when parking is located to the rear of the building and a public plaza or outdoor pedestrian amenity is provided.
KP D-7.1.3 Campus-style building layouts are acceptable.

KP D-7.2 Encourage centralized, interconnected parking areas to locate behind commercial or civic uses that front on the Key Peninsula Highway or SR 302.

KP D-7.2.1 Encourage shared parking or other methods to reduce the amount of parking area required.

KP D-7.2.2 Create incentives for businesses to share access driveways that reduce access points onto the Key Peninsula Highway and SR 302.

KP D-7.2.3 Design parking lots and parking spaces to accommodate larger vehicles common to the rural area.

GOAL KP D-8 New buildings and the significant exterior remodels of existing buildings should provide a rural or rustic building appearance following concepts of traditional Northwest architecture.

KP D-8.1 New buildings should utilize a basic architectural style that is considered traditional to the Pacific Northwest.

KP D-8.1.1 Reduce the apparent scale of new commercial or civic buildings. Simple rectangular building form may be articulated by smaller secondary volumes. Expansive primary facades should be modulated to create visual interest.

KP D-8.1.2 Provide simple gable or hip roofs with consistent pitches (typically 4:12 to 6:12). Roofs should include a wide sheltering eave that provides protection from the weather. Roofing materials such as asphalt composition, cedar shake, or metal are appropriate.

KP D-8.1.3 Encourage vertical or square windows. Windows should be able to open and close. When horizontal window areas are desired, groups of windows should be installed, limiting large single pieces of glass.

KP D-8.1.4 Discourage standardized corporate or franchised style in the design of new buildings.

KP D-8.2 Timber-framed buildings with extensive use of stone, brick, and other natural materials provide the desired exterior appearance of buildings in rural commercial centers.

KP D-8.2.1 Wood, stone, brick, or synthetic materials that resemble natural building materials are the appropriate building materials for exterior facades.

KP D-8.2.2 Wood siding and trim are encouraged. The use of vinyl or metal siding is discouraged.

KP D-8.2.3 Natural colors are important to help buildings maintain a rural appearance. Bright primary colors are discouraged.

KP D-8.3 Screen trash and recycling areas, outdoor storage areas, and loading docks from public streets and public spaces.
KP D-8.4  Locate or screen mechanical and HVAC units, antennas, satellite dishes, and other exterior equipment to minimize visibility from the public street.

**SIGN DESIGN**

**GOAL KP D-9**  Construct all new signs of natural materials or use natural-appearing facades to be designed and placed in a manner to enhance the scenic atmosphere of the Key Peninsula. Wooden signs with engraved, painted, vinyl, or stained lettering are more desirable than plastic, internally-lit signs. Signs should be maintained in a high-quality condition.

**GOAL KP D-10**  Authorize signs that meet community established standards for size, location, and design.

**KP D-10.1**  Allow attractive signs in rural commercial zones to adequately advertise permitted business activities.

**KP D-10.1.1**  Monument signs are the preferred type of freestanding signs in rural commercial zones. Develop incentives which discourage freestanding pole signs.

**KP D-10.1.2**  Encourage multi-tenant commercial developments to consolidate freestanding signs on one sign support structure to reduce the visual impacts associated with multiple freestanding signs along the road right-of-way.

**KP D-10.1.3**  Signs within multi-tenant commercial developments should have similar design characteristics to provide a consistent appearance.

**KP D-10.1.4**  The sign code shall assure that all signs are sized based on the speed limit of the abutting street.

**KP D-10.1.5**  Businesses in rural commercial centers that do not have frontage on SR 302 or the Key Peninsula Highway may have one off-site business identification sign. Business should consolidate these signs on individual monument sign support structures near a location where customers would leave SR 302 or the Key Peninsula Highway to access the business location.

**KP D-10.1.6**  Businesses with frontage on SR 302 or the Key Peninsula Highway may not have off-premise signage.

**KP D-10.1.7**  Allow the placement of one community kiosk in each rural commercial center. The kiosk could contain a map to identify business locations as well as individual nameplates for each business.

**KP D-10.1.8**  Allow the placement of community entry signs in each rural commercial center that identifies the commercial center.

**KP D-10.2**  Businesses located outside of rural commercial areas shall be allowed to advertise permitted business activities.
KP D-10.2.1 Home occupations, cottage industries, and agricultural uses shall be allowed to display one 8-square-foot business sign on the site where the permitted business activity is located.

KP D-10.2.2 Home occupations, cottage industries, and agricultural uses shall be allowed to display off-site directional signs on private property. These signs shall require a sign permit. Each sign shall have a consistent appearance based on community-established design criteria for size and color. The number of signs permitted shall be the minimum number necessary to provide directions at those intersections requiring a change of direction between SR 302 or the Key Peninsula Highway to the business location.

KP D-10.2.3 Regulate signs for permitted uses in rural residential zone classifications based on the speed limit of the road fronting the permitted use.

KP D-10.3 New signs shall be designed to meet specific design standards.

KP D-10.3.1 Encourage signs that are constructed with natural materials or have natural appearing facades.

KP D-10.3.2 Develop design standards that include incentives for installing signs which are constructed with natural materials.

KP D-10.3.3 The facade of the base structure of all monument signs shall be constructed of natural or natural-appearing materials such as stone, wood, or brick.

KP D-10.3.4 Limit the illumination and mechanical movement of new signs.

KP D-10.3.4.1 Indirect illumination of signs is preferred to internally illuminated signs.

KP D-10.3.4.2 Internally illuminated signs are permitted in rural commercial zones.

KP D-10.3.4.3 Signs which flash or otherwise have light that turns on and off intermittently are prohibited.

KP D-10.3.4.4 Signs which incorporate exposed neon tube illumination are permitted only indoors in businesses located in rural commercial zones.

KP D-10.3.4.5 Signs which include visible moving parts or have any visual mechanical movement are prohibited.

KP D-10.3.4.6 Electronic signs which change color or text and electronic message signs are prohibited. This policy is not intended to restrict or prohibit electronic message center signs for public safety service providers or time and temperature signs.

KP D-10.3.5 Signs which are not visible from a road right-of-way or public parking lot shall be exempt from sign design standards.

KP D-10.4 Special considerations shall be made for community-oriented information signs.

KP D-10.4.1 Allow off-site community signs that identify civic uses including boat ramps, shoreline access, bicycle routes, parks, and similar activities.
KP D-10.4.2 Design off-site community information signs to meet specific standards for size and color.

KP D-10.4.3 Reduce visual clutter of off-site community signs by encouraging these informational signs to be placed on the same sign support structure when possible.

KP D-10.4.4 Community signs that are placed on the same location as the activity that is being advertised may be increased in size and shall meet community standards for sign design.

KP D-10.4.5 Allow public safety services, parks, and schools to install internally illuminated reader board signs.

KP D-10.4.6 Allow the temporary installation of community and civic event banners.

KP D-10.4.7 Allow community identification signs at prominent entrances to the community. Encourage the installation of a Welcome to the Key Peninsula sign along SR 302 near Wauna.

KP D-10.5 Promote a gradual reduction in the number of nonconforming signs. Any business with a nonconforming sign or signs shall be required to remove or modify the sign(s) such that compliance with the sign code is achieved prior to the issuance of any building permit for the expansion, modification, remodel of the building, or change in the use of the business.

KP D-10.6 Inventory all signs visible from public rights-of-way on the Key Peninsula to establish a benchmark for sign enforcement purposes.

KP D-10.7 Support an annual sign clean-up day. Consider using volunteer groups such as Citizens Against Crime to assist in identification or removal of illegal signs.

KP D-10.8 Develop a pilot program on the Key Peninsula to authorize the installation of off-site tourist-oriented directional signs within the County road right-of-way.

**Implementing Actions**

The following list of actions need to be completed in order to implement the policies contained within this plan. They are arranged according to the timeframe within which each should be completed: short, medium, or long term. Short-term actions should occur within one year of plan adoption. Mid-term actions should be completed within 1-5 years. Long-term actions should be completed within 5-10 years of plan adoption. The entity or entities responsible for leading the effort to complete the action item is listed in parenthesis following the action. Actions are assigned to the Land Use Advisory Commission (LUAC), Pierce County Planning and Land Services (PALS), Pierce County Economic Development (ED), Pierce County Parks and Recreations (Parks), Pierce County Public Works & Utilities (PWU), Tacoma-Pierce County Health Department (TPCHD), Pierce County Assessor, Pierce Conservation District (PCD), Key Peninsula Community Councils, and the Key Peninsula Business Association.
**Short Term Actions (Upon Plan Adoption to 1 Year)**

1. Amend Title 18A, Zoning cottage industry standards to:
   - Require a forested buffer along SR 302 and Key Peninsula Highway outside of rural commercial areas. (PALS)
   - Provide design standards to adequately screen certain home occupations and cottage industries from adjacent residential dwellings. (PALS)
   - Provide flexible setback standards for new buildings within rural commercial centers to encourage construction close to the street with parking facilities located behind the buildings.

2. Amend Title 18J, Design Standards and Guidelines to:
   - Establish design standards and guidelines and a site plan review and approval process for all development within rural commercial centers. (PALS)
   - Provide incentives for property owners to follow low impact development techniques for new development. (PALS, PWU)
   - Establish maximum impervious surface standards and minimum native vegetation retention requirements. (PALS)
   - Utilize development incentives as a method for implementing design standards. (PALS)
   - Implement tree retention and reforestation requirements within road side buffers.
   - Discourage clear cuts adjacent to SR 302 and the Key Peninsula Highway. (PALS)
   - Provide opportunities for traffic calming techniques to be constructed within rural commercial centers. (PALS, PWU)
   - Implement design features that will encourage pedestrian circulation within rural commercial centers. (PALS)
   - Integrate new development with existing developments through strategic placement of landscaping, connected parking and pedestrian pathways.
   - Encourage centralized, interconnected parking areas to locate behind commercial or civic uses that front on the Key Peninsula Highway or SR 302.
   - Utilize a variety of incentives and development standards to encourage new buildings and the significant exterior remodels of existing buildings to provide a rural or rustic building appearance following concepts of traditional Northwest architecture.

3. Amend Title 18B, Signs to:
   - Establish sign design standards and a sign review and approval process. (PALS)
   - Encourage monument signs and discourage freestanding pole signs. (PALS)
   - Encourage multi-tenant commercial developments to consolidate freestanding signs on one sign support structure. (PALS)
   - Establish sign design standards for home occupations. (PALS)
   - Establish standards that would reduce the number of nonconforming signs throughout the Key Peninsula. (PALS)
• Authorize community entry signs at each rural commercial center. (PALS)

4. Provide sign design standards that would permit off-site community signs that identify civic uses, including boat ramps, shoreline access, bicycle routes, parks and similar activities. (PALS)

5. Amend the Shoreline Management regulations to allow a community entrance sign on the Purdy sand spit near Wauna. (PALS)

6. Allow the placement of one community kiosk in each rural commercial center. (PALS)

7. Encourage all development within the Home Historic District to follow the guidelines for construction contained in the Home, Washington Historic District Design Manual. (PALS)

8. Implement development incentives that encourage protection and preservation of historic landmarks and buildings. (PALS)

**Mid-Term Actions (1-5 years)**

1. Develop a comprehensive inventory of cultural resources including historical significant features on the Peninsula. (PALS)

2. Develop a pilot program on the Key Peninsula to authorize the installation of off-site tourist-oriented directional signs within the County road right-of-way. (PALS, PWU, LUAC)

3. Support the development of streetscape improvements within rural commercial centers that will encourage economic development. (PALS, PWU)

4. Explore a variety of sources to fund streetscape improvements. (PALS, PWU)

5. Encourage the development of “Gateway” identification markers at entrances to rural commercial centers. (PALS, ED, LUAC, Key Peninsula Business Association)

6. Support an annual sign clean up day. Consider using volunteer groups such as “citizens against crime” to assist in identification or removal of illegal signs. (PALS, Pierce County Responds, LUAC, KP Community Council)

7. Pursue opportunities for public investment to provide pocket parks within rural commercial areas. (PALS, Parks, ED, KP Business Assoc., KP Community Councils)

**Long Term Actions (5-10 years)**

1. Implement traffic streetscape improvements including calming techniques within rural commercial centers. (PALS, PWU)

2. Inventory all signs visible from public rights-of-way on the Key Peninsula to establish a benchmark for sign enforcement purposes. (PALS, KP Business Assoc., KP Community Councils)
Chapter 4: Natural Environment Element

DESCRIPTION OF CURRENT CONDITIONS

The following information has been compiled from the following sources: The Shoreline Master Program for Pierce County - March 1974; Key Peninsula Gig Harbor Islands Watershed Characterization and Action Plan - July 1999; Key Peninsula, Gig Harbor, and Islands Watershed Nearshore Salmon Habitat Assessment - July 2003; Pierce County Biodiversity Network Assessment - August 2004; Key Peninsula - Islands Basin Plan, Draft Basin Characteristics - September 2004; WRIA 15 Watershed Plan.

WATER RESOURCES

SHORELINES

The Washington State Shoreline Management Act (SMA) provides for the management of water bodies identified as “shorelines of the state.” The marine waters of Puget Sound that surround the Key Peninsula and Herron Island, including Case Inlet, Drayton Passage, Pitt Passage, Carr Inlet, Henderson Bay, and the many other minor bays and inlets, are all regulated shorelines of the state. Freshwater lakes exceeding 20 acres are also regulated under the SMA. These lakes include Bay Lake, Carney Lake, Lake Minterwood and Stansberry Lake. Areas under jurisdiction of the SMA include the specific water bodies, all lands within 200 feet of their ordinary high water mark, and their associated wetlands and floodplains. There are no rivers or streams on the Peninsula that are managed under the SMA.

The Pierce County Shoreline Master Program (SMP), adopted by Pierce County under the SMA, includes five Shoreline Environments – Natural, Conservancy, Rural, Rural Residential, and Urban. All shorelines are given a Shoreline Environment designation that reflects environmental conditions. The Shoreline designation identifies the type and intensity of development allowed.

Much of the shoreline area on the Key Peninsula is medium to high bank with areas containing significant bluffs. The exceptions to this are the bays and inlets where low bank shoreline is prevalent. The majority of the saltwater shorelines surrounding the Key Peninsula are either designated as a Rural, Rural Residential, or Conservancy Shoreline Environment. Low to medium bank shoreline areas are typically designated as Rural or Rural Residential. Conservancy areas are generally associated with an environmental feature such as a marine bluff or estuary. The sand spits within the plan area have been designated as Natural Shoreline Environments.
Carney Lake is designated Rural and includes 20.5 acres in Pierce County and 18.7 acres in Kitsap County. The shoreline of Carney Lake is developed with low density residential uses and the lake is used for recreational purposes. Bay Lake is designated Conservancy and is the largest lake on the Key Peninsula covering 147 acres. The shoreline of Bay Lake is partially developed with low density residential uses but is primarily surrounded by forest land. Bay Lake is included in the Pierce County Biodiversity Network and the shoreline area contains a wide variety of bird and mammal species. Lake Minterwood and Stansberry Lake are shallow lakes designated Rural Residential. Their shorelines have been extensively developed with residential uses and are used for recreational purposes.

**Surface Water**

**Streams**

The Key Peninsula is drained by a number of small and moderate-sized streams. The watersheds of the streams vary in size from a few acres to approximately 19 square miles. Rocky, Burley, and Minter Creeks and their tributaries drain the largest watersheds. The larger streams are perennial. Most of the land close to the edges of the Peninsula drains to small, unnamed, ephemeral streams which discharge directly to Puget Sound.

Surface water hydrology is greatly influenced by land use. Prior to settlement most of the Peninsula was heavily wooded. Very little precipitation flowed directly to surface streams during storms. Most precipitation evaporated from the wetted surfaces of vegetation or percolated first into the thick layer of vegetable matter on the forest floor and then gradually moved laterally toward surface streams or downward into the underlying soil layers. As the Peninsula was settled, the mature trees were logged, and land was cleared for agriculture, homes, and roads. Dense forest that produced very little runoff was replaced by land uses with less ability to detain water. The volume of surface runoff increased, as did the peak flow rates in surface streams. In many cases, these increased flows have resulted in destabilization of stream banks and the degradation of fish and wildlife habitat.

In 1981, the state established an instream flow protection plan for Water Resource Inventory Area 15 (WRIA 15) under administrative rule WAC 173-515. The Key Peninsula planning area is wholly contained within WRIA 15. Instream flows are usually defined as the stream flows needed to protect and preserve instream resources and values, such as fish, wildlife and recreation. Instream flows are established through an administrative rule and essentially represent a water right for streams. Instream flows do not affect water rights in existence at the time they are set, but do affect future water rights and withdrawals established after the instream flow rule is established. Any time the stream flow falls below the minimum level set, all water rights junior in priority date to the instream flow could be ordered to shut off diversions until the stream flows return to the set level. In the Key Peninsula planning area, Minter and Rocky creeks have set instream flows.

Most streams that are listed in the Kitsap Peninsula instream flow rule are closed, or seasonally closed, to future diversions. A stream closure is a legal determination that no additional surface water is available to be withdrawn from the regulated stream, regardless of a stream
flow rate. No new groundwater rights in hydraulic continuity with closed surface waters can be granted unless the impact to the stream is sufficiently mitigated. In the Key Peninsula planning area, Rocky and Lackey creeks have established partial stream closures and Minter and Dutcher creeks are closed year round.

Exempt wells, (wells using less than 5,000 gallons a day) are exempt from the water rights permitting process; however, if the cumulative effects of exempt wells are found to seriously affect stream flows then exempt wells can be limited to in-house use only under the Kitsap Peninsula instream flow rule.

## Lakes

The Key Peninsula contains numerous lakes, ranging in size from 147 acres to less than one acre. According to the KGI Watershed Characterization and Action Plan, the majority of lakes are less than ten acres in size and most are shallow (less than 30 feet in depth). Nearly all of the lakes are used for sport fishing, boating, swimming, and other recreation. Some of the lakes are known to support cold water fish such as rainbow and cutthroat trout and some contain warm water species such as largemouth bass and bluegill.

Other than size and use information, relatively little water quality or biological information exists for most of the lakes. The few lakes that have been studied were studied primarily due to problems with water quality or excessive plant growth. Invasive aquatic plants such as Eurasian milfoil have been identified as significant problems in several lakes. Residential development is occurring around many of the lakes in the area and pressure for continued development within lake watersheds is likely to continue in the future. Unless carefully managed, development often results in additional surface runoff and nutrient loading. Excessive nutrient and sediment loading can lead to unacceptable algae blooms and emergent plant growth and can accelerate eutrophication.

## Wetlands

The National Wetland Inventory (NWI) for the Key Peninsula indicates that wetlands are present throughout the community plan area. The NWI map identifies approximately 3,111 acres of wetland areas. The majority of wetlands identified by the NWI map (58%) are palustrine wetlands. Palustrine systems include all nontidal wetlands dominated by trees, shrubs, mosses or lichens, as well as wetlands that occur in tidal areas where salinity concentrations are very low. Palustrine systems may not exhibit open water areas and are often difficult to recognize by the general public. The next largest category of wetlands are estuarine wetlands (26%). Estuarine systems consist of tidal habitats and adjacent tidal wetlands in which saltwater is diluted by freshwater runoff from the land. Estuarine wetlands are usually semi-enclosed by land but have a connection to Puget Sound. The NWI map identifies that 16% of the wetlands are lacustrine systems, which include wetlands and deepwater habitats (such as lakes) that are greater than 20 acres in size, are situated in a topographic depression or a dammed stream channel, and lack trees, shrubs, mosses, or lichens with greater than 30% coverage. It is likely that the Key Peninsula contains many more
wetlands than are identified on the NWI maps. NWI maps do not provide information regarding the category or quality of wetlands.

Pierce County categorizes wetlands as a part of the implementation and enforcement of the Critical Area regulations. There are four categories of wetlands described. Category I wetlands are high quality wetlands, high quality rare wetlands, wetlands of exceptional local significance, or documented habitat for endangered species. These wetlands include high quality estuarine wetlands, sphagnum bogs and fens, and mature forested swamps. Category II wetlands do not contain features outlined in Category I. These wetlands include significant spring-fed systems, peat systems, forested swamps with three canopy layers, wetlands along salmon streams, and certain open water wetlands. Category III wetlands are regulated wetlands that do not contain features outlined in Category I, II, or IV. Category IV wetlands are hydrologically isolated wetlands less than or equal to one acre in size which do not meet the criteria of a Category I or II wetland, contain only one wetland class, and have only one dominant plant species (monotypic vegetation).

**Surface Water Quality**

There is limited historical data available on surface water quality on the Key Peninsula prior to the 1990s. Data collected since the 1990s indicates that there are water quality problems in some of the streams on the Peninsula that should be addressed. The results of various monitoring efforts indicate that levels of fecal coliform bacteria in streams and bays frequently exceed state water quality standards. Other water quality parameters of concern include dissolved oxygen and turbidity. Section 303(d) of the Federal Clean Water Act (CWA) requires Washington State to periodically prepare a list of all surface waters in the state for which beneficial uses of the water (such as for drinking, recreation, aquatic habitat, and industrial use) are impaired by pollutants. As of 2004, there are eight streams on the Key Peninsula that are listed on the 303(d) list as water quality limited. The listed streams are: Dutcher, Lackey, Rocky, Burley, Huge, Little Minter, Minter, and Purdy Creeks. Additional unnamed streams on the Peninsula may also be water quality limited but it is not possible to distinguish unnamed streams on the list.

Surface water quality is also monitored by the Washington State Department of Health - Office of Shellfish Programs in estuaries and bays where shellfish are harvested commercially or recreationally. The primary pollutant of concern that is monitored at these locations is fecal coliform bacteria. Concentrations of fecal coliform bacteria indicate the possible presence of pathogens and disease-causing organisms in the water due to contamination from agricultural runoff, livestock waste, improperly functioning or failed septic tanks, stormwater runoff, boat waste, or wildlife. The presence of pathogens and disease-causing organisms that are associated with fecal coliform bacteria in surface water pose a public health risk for harvested shellfish as well as for other forms of human contact with the water such as swimming. Several of the beaches on the Peninsula are closed or under shellfish harvesting restrictions due to pollution.
GROUNDWATER AND WATER SUPPLY

GROUNDWATER

Most residents of the Key Peninsula rely on groundwater as their sole source of potable water. The water is obtained from a variety of private and community wells. The water is tapped from several local aquifers that are replenished by rainfall. Precipitation that percolates into the ground enters a shallow unconfined aquifer within the permeable Vashon Drift Formation. Some of the water in the shallow aquifer continues to move downward into the Salmon Springs Drift through openings in the impermeable Kitsap Foundation. Some water is discharged via springs and seeps to Puget Sound either directly or via surface streams. Most of the water used for domestic purposes on the Key Peninsula is obtained from wells that penetrate the intermediate aquifer in the Salmon Springs Drift to a depth of 150 to 250 feet below the land surface. The intermediate aquifer is partially confined below the relatively impermeable Kitsap Formation and is thus better protected from contamination than the shallow aquifer. Groundwater on the Peninsula is not obtained from aquifers connected to the Olympic or Cascade Mountains.

In 1998, the Washington State Legislature passed the Watershed Management Act (RCW 90.82) due to the recognition that watersheds throughout the state were facing diminishing water availability and quality and the loss of critical habitat for fish and wildlife. This legislation, referred to as “2514 watershed planning” provides for locally-based watershed planning with the goal of giving local interests a voice and a forum for collaboration and input into water resource management decisions. Watershed planning for WRIA 15 began in early 2000. Water resource information was collected, technical studies were reviewed, and recommended actions were suggested. The planning unit charged with completing the watershed plan could not come to consensus and efforts were suspended in 2005.

A primary purpose of watershed planning under the Watershed Management Act was to develop an understanding of water resource needs within a watershed (demand) as well as an estimate of the amount of water naturally occurring within a watershed (supply). This is not an easy task. For example, even the most refined water balance numbers, such as actual rainfall data as collected at rainfall monitoring locations are not absolute. Data often varies from season to season and from year to year. Changes in land use and land cover alter infiltration, evaporation, transpiration, and run-off rates. Finally, human consumption from sources such as Exempt Wells, is difficult to determine and can change over time.

In 2005, a revised water balance was produced through the WRIA 15 watershed planning process, based upon analyses conducted during the five-year process. This revised water balance estimates that of the 50.6 inches of average rainfall a year occurring on the Kitsap Peninsula, 42% is lost to evapotranspiration, 37% goes to Puget Sound in the form of surface runoff, 14% provides baseflow to streams, and 7% is recharged to deeper aquifers.

The 2005 revised water balance is of a generalized nature and concludes that refinements are needed on a sub-basin scale which should be based upon monitoring of conditions in order to capture the unique hydrologic characteristics occurring within each of the 23 sub-basins, as
delineated during the watershed planning process. The water balance further identifies the sub-basins in the Kitsap Peninsula recommended for such a refinement due to existing (or allocated) water rights and groundwater withdrawal (or water use) estimates. The two sub-basins in the Key Peninsula Community Plan area (Key Center and Long Branch) are not included on this list of recommended high priority sub-basins.

Generally speaking, freshwater supply for domestic use and for fish and wildlife is a limited resource in the Key Peninsula Community Plan area. Fortunately, adequate supplies appear to be available through the 20-year planning period with reasonable conservation or efficiency measures and monitoring programs to ensure this continues to be the case.

**GROUNDWATER QUALITY**

As water passes through the surface soils and percolates downward into the deeper aquifers it undergoes chemical changes as a result of natural processes and human influences. Shallow groundwater typically contains higher concentrations of nitrates than deeper groundwater because it is more influenced by human activities including the use of septic tanks for wastewater disposal, use of fertilizers, and domestic animal husbandry.

Groundwater quality on the Key Peninsula is generally very good; however, there is a potential for serious groundwater quality problems as a result of seawater intrusion. Seawater intrusion can occur when wells that draw upon groundwater aquifers are pumped at a rate that exceeds the local recharge capacity. The resulting reduction in hydraulic pressure in the freshwater aquifers causes seawater to migrate landward. In severe cases, the salinity of water drawn from wells may increase to the point at which it is unusable for domestic or irrigation purposes. Although there have not been any significant cases of seawater intrusion reported on the Key Peninsula, minor cases have been reported in the Longbranch, Taylor Bay, and Glen Cove areas. More significant cases have been reported in other coastal communities in the Puget Sound region.

Wellhead protection areas are found in various locations throughout the Peninsula. These areas are defined as property within the 10-year time-of-travel zone boundary of a Group A public water system well. Wellhead protection areas are regulated as aquifer recharge areas in the Critical Area regulations. It is the intent of the aquifer recharge standards to protect groundwater that is vulnerable to contamination by new land uses.

**WATER SUPPLY**

Under Washington State law, the waters of Washington collectively belong to the public and cannot be owned by any one individual or group. Instead, the Department of Ecology (DOE) may grant individuals or groups the right to use water. A water right is a legal authorization to use a certain amount of public water, in a certain area, for specific beneficial uses. While State law requires every user of surface waters (i.e., streams, lakes, springs) to obtain a water right, certain groundwater uses are exempt from the requirement of obtaining a water right from DOE. Generally, the use of groundwater at an amount less than 5,000 gallons per day are “exempt” from the requirement of obtaining a water right and thus are referred to as exempt
Domestic water on the Peninsula is provided by a combination of individual wells, small Group B water systems and larger Group A water systems. The majority of the Peninsula is undesignated in regards to public water service. Group B water systems provide between two and 15 connections. Approximately 235 Group B water systems operate on the Peninsula. Group A water systems are those public water systems serving more than 15 connections or those which serve 25 or more people per day for 60 or more days per year regardless of the number of connections. Currently, approximately 52 Group A water systems operate on the Peninsula with approximately one-third of the Group A water systems defined as “non-community,” thus serving such uses as camps, parks, churches, schools, and civic centers. Currently, individual wells are not well quantified.

In order to ensure safe and reliable water service and to meet new requirements, many of the smaller water systems in the community plan area have enlisted the operation or ownership services of Satellite System Management Agencies (SSMAs). SSMAs are approved by the Washington State Department of Health (DOH) to own or operate more than one unconnected water system. The primary SSMAs providing management or ownership services on the Key Peninsula are Washington Water Service and Peninsula Light Company. Washington Water Service has several regional planning areas on the Peninsula which they intend to provide water service as its owned, but unconnected, water systems become “intertied,” or connected, over time.

Throughout the greater Puget Sound region, water system purveyors are beginning to recognize the importance of regional water sources and are working together to intertie individual systems in order to share limited water resources. Due to the rural nature of the Key Peninsula such regional sources, even on a smaller scale, may be impossible. Outside of existing water systems, new small-scale community water systems may be infeasible due to low density development. Instead, the most likely source of domestic water for new large lot development will be in the form of individual wells. Additionally, the expansion of existing water systems, as envisioned by Washington Water Service, will occur in some areas of the Peninsula to serve new development.

**Earth Resources**

**Geologic Formations**

The Key Peninsula is geologically and topographically similar to other regions in the South Puget Sound region, reflecting the influences of volcanic activity, tectonic plate movement, and glacial activity. Four major geologic formations underlie the Peninsula. The uppermost layer is the Vashon Drift, which consists mostly of sand and gravel. The permeable Colvos Sand unit of the Vashon Drift occupies much of the area, although it is often covered by a layer of less permeable Vashon Till. Below that is the Kitsap Formation, which consists primarily of low permeability clay and silt and typically has a depth of about 100 feet, although in some areas it is entirely absent. Another layer of permeable sand and gravel, the Salmon Springs Drift, lies...
under the Kitsap Foundation and extends below sea level. The Pre-Salmon Springs Deposits, consisting mostly of unconsolidated materials, extend to bedrock at a depth of about 1,000 feet below sea level. The upper portion of the Pre-Salmon Springs Deposits consists of clay and silt and lower portions consist of sand and gravel.

**TOPOGRAPHY**

The Key Peninsula is a peninsula of land extending southward into Puget Sound from the much larger Kitsap Peninsula. Much of the land surface of the Key Peninsula lies between two and three hundred feet above sea level and is characterized by a terrain of rolling, rather flat-topped hills and ridges. Bluffs drop to the waters of Puget Sound at most locations on all three sides of the Peninsula. Slopes in the upland areas of the Peninsula typically range from 0 to 30 percent, with most areas having slopes of 6 to 15 percent. Slopes reach 45 to 70 percent along the bluffs at the edges of the Peninsula.

**SOILS**

Surface soils on the Peninsula are moderately to highly productive suited to growing native vegetation, as well as certain crops such as strawberries, raspberries, and hay. Drainage and erosion characteristics of the soils vary according to composition and slope. The most common soil on the Peninsula, Harstine gravelly sandy loam, consists of approximately 5 to 36 inches of gravelly sandy loam underlain by a substratum of up to 60 inches of compact glacial till that is cemented in places. A water table is often perched above the glacial till during periods of heavy rainfall. In some residential neighborhoods, onsite sewage disposal systems such as septic tanks may fail or not function properly during heavy rainfall periods. Ponding is generally of short duration because water flows laterally above the glacial till and seeps at the bottom of slopes. Harstine soil is moderately productive under good management, but the available water capacity is low. The soil is capable of supporting large loads but slopes ranging up to 45% may limit suitability for development in some areas. Other common soils on the Peninsula include Indianola loamy sand and Kitsap silty loam. Indianola soils have rapid permeability and slow surface runoff and can support more residential density and on-site sewage treatment systems. Depending on the slope, the erosion hazard is generally low. Kitsap soils are moderately well drained but permeability can be very slow. Surface runoff is medium and erosion hazard is moderate. Kitsap soil is subject to hillside slippage. Under good management, Kitsap soil is highly productive. The available water capacity in Kitsap soils is high, and due to the high seasonal water table septic drainfields do not function properly during the wet season. The southern portion of the Key Peninsula contains Bow silt loam in addition to the Harstine soils. Bow soils are somewhat poorly drained with slow permeability in the substratum. Surface runoff is medium and erosion hazard is moderate. Soils in the Kitsap-Indianola complex and Xerochrepts associations with 45 to 70 percent slopes are common along the bluffs at the edges of the Peninsula. These soils are well-drained but runoff is very rapid due to the slope and the erosion hazard is very severe.
**FISH AND WILDLIFE RESOURCES**

**FISH**

There are diverse populations of saltwater, freshwater, and anadromous fish within the Key Peninsula plan area. This is attributable to its extensive shoreline and surface water.

Saltwater (marine) species that are found in the waters offshore of the Peninsula include cabezon, dogfish, flatfish, greenlings, lingcod, Pacific cod, pollack, rockfish, skate, surf perch, and whiting. Also found in the waters surrounding the plan area are baitfish, such as herring, sand lance, and surf smelt. Baitfish are an important food source for predatory fish, birds, and mammals. A herring spawning area is documented in Mayo Cove. Sand lance spawning areas are located on the east and west sides of the Peninsula and in Filucy Bay. Surf smelt spawning areas are located along the shoreline of Henderson Bay in Glencove, Filucy Bay, and Mayo Cove.

Land-locked freshwater native species, including cutthroat and rainbow trout are found in streams throughout the plan area. Several non-native species of bass, bluegill, and perch can be found in lakes on the Key Peninsula.

The primary anadromous species found in streams on the Peninsula are the Coho (silver) and chum (dog) salmon although five species of salmon, sea-run cutthroat and steelhead trout can be found in the waters that surround the plan area. Specifically, Rocky Creek supports Chinook, Coho, and chum salmon runs. Dutcher Creek supports a run of Coho salmon. Minter Creek support runs of Chinook, Coho, chum, and pink salmon. Lackey Creek is home to a chum salmon run. Steelhead trout have been documented in the Rocky, Minter, and Lackey Creek drainages. Native runs of sea-run cutthroat trout are present in most of the perennial streams on the Peninsula. The Washington State salmon hatchery at Minter Creek, salmon enhancement efforts of several volunteer organizations, as well as the efforts of many private property owners support the continued runs of anadromous fish within the plan area.

**SHELLFISH**

There are a number of commercial shellfish growing areas on the Peninsula including Burley Lagoon, Minter Bay, Filucy Bay, and Rocky Bay. The following commercial shellfish harvesting locations are monitored regularly for fecal coliform bacteria: Burley Lagoon, Drayton Passage, Dutcher Cove, Filucy Bay, Minter Bay, and Rocky Bay. The following recreational shellfish harvesting locations are also monitored for fecal coliform bacteria: Taylor Bay, Vaughn Bay, and Purdy Beach. Monitoring has occurred at some of these sites since the 1980s and repeated violations of water quality standards have been recorded at many of the sites, resulting in periodic or long-term shellfish bed downgrades or closures. Public beaches in Burley Lagoon, Glen Cove, Minter Bay, Von Geldern Cove, Mayo Cove, Taylor Bay, Vaughn Bay, and portions of
Filucy Bay and the Purdy Sand Spit are closed to shellfish harvesting due to pollution (DOH web site - April 27, 2005). Geoduck farming is becoming a popular but controversial aquaculture activity around the Peninsula.

**WILDLIFE**

There are a variety of wildlife habitats on the Key Peninsula. These include coniferous forests, prairie-type grasslands, wetlands, stream, lake and marine shorelines. This broad range of habitats is host to a wide variety of wildlife species native to the Pacific Northwest.

The forested and shrub areas support numerous large and small mammals, birds, reptiles, and amphibians. The most common smaller mammals found in these areas include chipmunks, foxes, hares, mice, opossums, porcupines, raccoons, shrews, skunks, and squirrels. A small number of larger animals including the coyote, Colombian black-tailed deer, and black bear occur where large contiguous forests remain. Common bird species found in forested and shrub areas are chickadees, crows, finches, goldfinches, hawks, jays, mountain quail, owls, robins, thrushes, warblers, and woodpeckers. Amphibians and reptiles commonly found in the plan area’s forest and riparian environments are frogs, garter snakes, salamanders, and toads.

Wetland, riparian, coastal, and open water areas are populated primarily by a few mammals including beavers, river otters, seals, and sea lions, as well as a wide variety of bird species such as bald eagles, ducks, Canadian geese, golden-eyes, grebes, herons, kingfishers, mergansers, ospreys, and teals.

Residential development, logging, and agricultural practices on the Peninsula have substantially reduced wildlife habitat through the years. However, valuable habitat qualities still remain in the undeveloped, large tracts of native vegetation and around the remaining wetlands and streamside forests throughout plan area.

**ENDANGERED, THREATENED, SENSITIVE AND CANDIDATE WILDLIFE SPECIES**

Congress passed the Endangered Species Act [ESA] in 1973 to protect species of plants and animals that are of “aesthetic, ecological, educational, historical, recreational, and scientific value.” The ESA is also intended to protect the listed species’ “critical habitat,” which is the geographic area occupied by or essential to the protected species.

The status of fish and wildlife species in Washington State are determined by the Washington Department of Fish and Wildlife. Areas identified by the Washington Department of Fish and Wildlife as containing protected species of wildlife and plants are labeled as Priority Habitat Areas. Factors considered include abundance, occurrence patterns, vulnerability, threats, existing protection, and taxonomic distinctness. The status categories are as follows:

- **Endangered (E):** In danger of becoming extinct or extirpated from Washington.
- **Threatened (T):** Likely to become endangered in Washington.
- **Sensitive (S):** Vulnerable or declining and could become Endangered or Threatened in the state.
- **Candidate (C):** Under review for listing.
- **Monitored (M):** Taxa of potential concern.
Species of concern found within designated Priority Habitat Areas on the Key Peninsula include the bald eagle (T), Puget Sound Chinook salmon (T), great blue heron (M), harbor seal (M), and osprey (M). Mountain quail, which have been spotted in several areas on the Peninsula are classified “rare or uncommon.”

**Open Space**

The term open space can mean a variety of things to different people. Some people think of open space as wild, undisturbed areas (i.e., natural open space) that serve as habitat for fish and wildlife or rural, scenic areas. Others think of artificially landscaped areas which offer a sense of visual relief from the built environment and a place to conduct passive recreation activities (i.e., greenbelts, golf courses, and parks), as open space. When considered together, all of these areas provide people a place to connect with nature.

The Pierce County Countywide Planning Policies require all jurisdictions (Pierce County, cities, and towns) to plan for the provision of open space; consider open space parks, environmentally sensitive lands and greenbelts, natural buffers, scenic and natural amenities, unique geological features; designate appropriate open space; and encourage new housing to locate in a compatible fashion with open space designations or outside designated open space.

The County Council adopted open space priorities in 1998. These priorities were established for any County program that provides for the preservation of open space. Open space resources were categorized as high, medium, or low priority for preservation or acquisition. In 1999, the County Council adopted a Comprehensive Plan text amendment which established a revised open space/greenbelt map based upon the high priority open space categories (critical salmon habitat, fish and wildlife habitat, wetlands, tidal marshes, estuaries, rivers and streams, marine waters, and wooded areas). These areas will receive the highest priority for any Pierce County programs that acquire or otherwise preserve lands for open space. In 2004, the Comprehensive Plan Open Space Corridor map was modified to reflect revised Biodiversity Network (i.e., fish and wildlife habitat areas) data.

**Description of Desired Conditions**

The natural environment on the Key Peninsula provide local residents with the opportunity to live, work, and play in a healthy and scenic environment. The native vegetation, marine shorelines, and fresh water streams contribute to the livability of the area. Preserving the remaining native fish and wildlife species and vegetation that provides the habitat for these species is important to the residents of the Key Peninsula. Accommodating planned growth while maintaining the functions and values of the natural environment is a priority. The following text describes the desired condition for each resource type in more detail.
WATER RESOURCES

SHORELINES
The natural shoreline processes should be protected for present and future generations. Activities that increase the function and value of marine shorelines are encouraged while activities that would degrade the marine environment are discouraged or prohibited. New developments near the shoreline are encouraged to utilize Best Management Practices. Development standards along shorelines should include incentives to preserve native vegetation and wildlife habitat and protect water quality. Efforts to provide clean water for businesses that depend on shoreline locations are a community priority.

SURFACE WATER
Surface water runoff should not negatively impact properties located downstream from development. Uncontrolled surface water can damage property, negatively impact the natural environment, and disturb salmon spawning areas and shellfish beds. To minimize impacts associated with uncontrolled surface water runoff, including soil erosion, flooding, and stream scouring, it is imperative that new development be properly designed. Pollutants and sediment are often carried to surface water bodies by stormwater runoff. Incentives should be provided to encourage residents and owners of livestock to engage in Best Management Practices. Agricultural practices should be conducted to eliminate fecal coliform bacteria contamination into riparian areas. On-site sewage system requirements and practices that could potentially allow contamination of surface waters should be eliminated. Wetland areas, streams, and lakes should be maintained into the future. Efforts to educate the public regarding the function, value, and importance of protecting surface waters should be pursued.

GROUNDWATER AND WATER SUPPLY
The Key Peninsula is dependent on groundwater for water supply. Groundwater on the Peninsula is supplied by rainfall resulting in potential water supply problems in the future. Groundwater supplies contained within the Key Peninsula aquifers should be protected and conserved. Aquifers can be damaged by non-point sources of pollution or by simply not capping abandoned wells. Water conservation measures should be implemented when possible. The Key Peninsula is susceptible to saltwater intrusion and several locations have shown evidence of some saltwater contamination. Measures should be taken to ensure seawater does not further contaminate local aquifers. Water availability, water needs, and water conservation measures should be evaluated in each land use decision process. Land use
and development decisions should be made with an emphasis on sustaining a long-term supply of high quality groundwater upon which the residents of the Key Peninsula depend.

**Fish and Wildlife Resources**

The existing native fish and wildlife species on the Key Peninsula and the natural habitats that support these species should be protected. Pierce County should provide educational information on the existing fish and wildlife species located within the plan area and on Best Management Practices (BMPs) for retaining these species. Degraded stream and nearshore habitat for anadromous fish should be improved throughout the plan area. Fragmentation of wildlife corridors should be avoided. New open space dedications should be linked with adjacent open space or critical areas to facilitate wildlife movement. Forest practice methods should promote a diversity of wildlife habitat. Programs that reduce pollution of shellfish beds should be implemented.

**Open Space**

Permanently preserving open space on the Key Peninsula is a priority. Public and private acquisition, preservation, and restoration efforts within the designated open space areas should be pursued through cooperative agreements, development incentives and public education and outreach efforts. Open space areas that provide quality fish and wildlife habitat or that contain designated critical areas should be preserved. Sites that provide important links between open space areas, offer significant views, or are registered as a historic place are priorities for open space acquisition. Development within designated open space areas should be established through specific density and intensity levels, appropriate uses, and low impact development techniques. Native vegetative buffer areas, vegetative screens, and greenbelts should be incorporated into the overall system of open space in order to soften impacts of development, provide opportunities for shoreline access, trails, create opportunities for pocket parks, and promote design that is consistent with community established standards. The Countywide Open Space/Greenbelt map should be amended to reflect the existing and desired system of open space within the community.

**Environment Policies**

**Goals**

The Key Peninsula’s unique natural ecosystems and environmental features will be enjoyed by present and future generations. The area’s clean air and water provide a healthy place for citizens to live. Environmental features such as lakes, streams, wetlands, aquifers, marine shorelines, and forested areas contribute to the quality of life and scenic beauty of the area and should be sustained. The area’s natural resources and natural systems should be protected; where degraded, they should be restored where appropriate.
GOAL KP ENV-1  Support public education and incentive-based programs that protect the function and value of the natural environment.

KP ENV-1.1  Provide informational brochures and publications to public and civic organizations including the library, fire stations, schools, utility providers, and community groups for distribution to local citizens.

KP ENV-1.2  Advertise public assistance opportunities for repairing failing septic systems.

KP ENV-1.3  Educate citizens regarding potential impacts of household hazardous waste on groundwater including proper use and disposal of fertilizers and pesticides.

KP ENV-1.4  Discourage the use of fertilizers and pesticides on lawns in shoreline areas. Offer educational information to residents regarding environmentally friendly, biodegradable, non-chemical alternatives.

KP ENV-1.5  Promote the use of non-toxic alternatives to household products. Provide informational handouts that explain how to dispose of toxic household products.

KP ENV-1.6  Require that educational information of shoreline best management practices is distributed to new shoreline property owners when the property is transferred.

KP ENV-1.7  Provide incentives that encourage environmentally sound development practices.

KP ENV-1.8  Encourage the removal of invasive plants such as Scot’s broom and noxious weeds such as tansy ragwort.

GOAL KP ENV-2  Consider the implementation of development regulations and incentives that encourage property owners to repair degraded environmental features on their land.

KP ENV-2.1  Provide incentives such as a streamlined development permit process for property owners to engage in BMPs that protect land and water resources downstream.

KP ENV-2.2  Establish development incentives which encourage property owners to eliminate dispersing fertilizers, pesticides, and other toxic chemicals in areas that could contaminate surface waters.

KP ENV-2.3  Require that landowners conducting agricultural operations implement farm best management practices to address, at a minimum, livestock waste and surface water protection prior to receiving property tax relief through the public benefit rating system.

GOAL KP ENV-3  Simplify and streamline the permit process for projects that enhance the environment.

KP ENV-3.1  Create a permit ombudsman position to facilitate the permitting process and resolution of disputes.

KP ENV-3.2  Evaluate the feasibility of providing local government services in the community such as a satellite development center office.
KP ENV-3.3 Designate staff resources to specific geographical areas (Key Peninsula) to facilitate staff expertise in individual communities.

KP ENV-3.4 Develop a process for Planning and Land Services staff to conduct site visits at the request of the property owner to determine the presence or absence of regulated Critical Areas prior to development permit application submittal.

KP ENV-3.5 Consider waiving additional Critical Area assessments and studies on sites containing several Critical Areas when a buffer is established exceeding the maximum buffer requirement for all remaining Critical Areas.

KP ENV-3.6 Pursue grants and other alternative funding options to conduct Critical Area inventories.

GOAL KP ENV-4 Provide adequate funding for timely enforcement of regulations that protect water quality.

GOAL KP ENV-5 Assist landowners, builders, and developers in avoiding impacts to surface waters through educational, technical, and financial assistance.

KP ENV-5.1 Site specific evaluations should be conducted to field-verify flood-prone areas. Any on-site monitoring will require the authorization by the property owners.

KP ENV-5.2 Support the ongoing efforts of volunteer organizations such as Pierce County Conservation District Stream Team and the South Puget Sound Salmon Enhancement Group. Stream Team’s goal is to improve the quality of streams for the benefit of fish, wildlife, and people.

GOAL KP ENV-6 Prioritize water quality problems.

KP ENV-6.1 Water quality problems that negatively impact economic development and jobs, such as pollution of shellfish beds, are the highest priority.

KP ENV-6.2 Failing septic systems are considered a high priority for repair as they can contaminate surface water and groundwater resources.

KP ENV-6.3 Consider providing a tax incentive for property improvements that reduce downstream pollution or conserve freshwater resources.

GOAL KP ENV-7 Encourage properties with livestock confinement areas to initiate or update a site-specific farm plan when the property changes ownership.

KP ENV-7.1 Farm plans may be prepared by the Pierce Conservation District, Natural Resource Conservation Service, or any other licensed or certified professional complying with Natural Resource Conservation Service standards.
KP ENV-7.2 Farm plans should address roof runoff management for livestock and agricultural buildings, sacrifice areas, waste storage and nutrient management, fencing, surface water protection, and pasture and mud management.

KP ENV-7.3 Provide incentives for landowners to implement farm plans.

KP ENV-7.4 Encourage programs that educate real estate professionals regarding issues that affect farm properties in sensitive areas.

---

**GROUNDWATER AND WATER SUPPLY**

**GOAL KP ENV-8** Develop methods to reduce the potential for saltwater intrusion in local aquifers.

**KP ENV-8.1** Provide property owners with information regarding saltwater intrusion and techniques for prevention.

**KP ENV-8.2** Encourage low impact development techniques along marine shorelines.

**KP ENV-8.3** Maximize on-site infiltration of stormwater in areas that are susceptible to saltwater intrusion unless such infiltration could result in the reduction of slope stability along marine bluffs.

**KP ENV-8.4** Provide incentives for property owners to conserve fresh water.

**KP ENV-8.5** Encourage voluntary water quality monitoring along marine shorelines to detect changes in chloride levels which may indicate saltwater intrusion.

**KP ENV-8.6** Promote the use of drought-resistant or native vegetation plantings in landscaping areas.

**KP ENV-8.7** Require new commercial development to provide low-flow, drip irrigation techniques in required landscaping areas where supplemental water is necessary for the survival of plantings.

**KP ENV-8.8** Discourage extensive, irrigated landscaped areas in new developments.

**KP ENV-8.9** Support the use of recycled water for irrigation purposes.

**KP ENV-8.10** Encourage water purveyors and homeowners to trace and repair leaks in existing water systems.

**KP ENV-8.11** Encourage property owners to retain native soils and reduce the compaction of yards and landscape areas.

**KP ENV-8.12** Promote educational programs that provide information to property owners concerning wellhead protection measures.

**KP ENV-8.13** Designate areas that are at increased risk of groundwater contamination as aquifer recharge areas.

**KP ENV-8.14** Consider establishing standards that prohibit the application of toxic substances to the land or water in areas that could damage aquifers, fish, or shellfish.
AIR RESOURCES

GOAL KP ENV-9  Continue to allow lawful outdoor burning on the Key Peninsula during appropriate times.

KP ENV-9.1  Provide information regarding outdoor burning restrictions and permit requirements to local residents.

KP ENV-9.2  Work with Fire District #16 in considering notification standards for land-clearing burns.

KP ENV-9.3  Recognize that all outdoor burning may be prohibited during times of increased fire danger or poor air quality.

KP ENV-9.4  Have the proper agency with authority enforce outdoor burning standards such as the prohibition of burning prohibited material.

FOREST, FISH, AND WILDLIFE RESOURCES

GOAL KP ENV-10  Limit fragmentation of wildlife habitat.

KP ENV-10.1  Locate any required open space dedication for new development adjacent to other open space tracts, wooded areas, or critical areas to facilitate wildlife movement.

KP ENV-10.2  Promote backyard wildlife sanctuary programs. Encourage the use of native vegetation and other habitat features in residential landscaping.

GOAL KP ENV-11  Promote forest practice methods that maintain a diversity of wildlife habitat.

KP ENV-11.1  Selective cuts are preferred over clearcuts. Timber harvest operations should leave trees that represent a variety of species and age categories.

KP ENV-11.2  Work with the State Department of Natural Resources regarding forest practices on the Peninsula. Provide the DNR with information regarding community plan priorities and local regulations. Encourage the DNR to meet local standards.

KP ENV-11.3  Selective cuts and small clear cuts should be used to create a diverse habitat for plants and wildlife.

KP ENV-11.4  Encourage fencing methods that allow for wildlife movement.

GOAL KP ENV-12  Promote the improvement of degraded stream and nearshore habitat conditions for anadromous fish throughout the community plan area.

KP ENV-12.1  Protect and improve environmental conditions that provide local employment opportunities and resource-based jobs in the community.

KP ENV-12.2  Identify point and nonpoint sources of pollution that affect shellfish beds.

KP ENV-12.3  Promote the services provided by the Pierce Conservation District such as farm management plans.
Septic systems should be maintained and pumped consistent with the Tacoma-Pierce County Health Department’s operation and maintenance program. Encourage the use of low-flow pumping fixtures and appliances to reduce the possible acceleration of slope failures by saturating on-site septic system drainfields.

**Open Space**

**GOAL KP ENV-13** Identify and develop strategies for preserving open space on the Key Peninsula.

- **KP ENV-13.1** Update the Countywide Open Space Corridors Map to reflect local conditions.
- **KP ENV-13.1.1** Eliminate properties from the Open Space Corridors Map that have been developed to the extent that open space objectives cannot be met.
- **KP ENV-13.1.2** Include areas described as a high priority resource in Pierce County Code, Chapter 2.114.
- **KP ENV-13.1.3** Properties that do not include a high priority resource should be considered for inclusion in the Open Space Corridors Map when they fill in a gap between open space corridors.
- **KP ENV-13.1.4** Conduct an inventory of all public properties within the plan area which may be utilized for open space.

**GOAL KP ENV-14** Encourage public and private acquisition and preservation of open space.

- **KP ENV-14.1** Promote the use of the Pierce County Conservation Futures program and the Current Use Assessment-Public Benefit Rating System on the Key Peninsula.
- **KP ENV-14.2** Advertise Conservation Futures and Current Use Assessment programs in the Key Peninsula and Peninsula Gateway newspapers.
- **KP ENV-14.3** Provide incentives to promote public access for trails, parks, marine shorelines, and points of esthetic and historical interest.
- **KP ENV-14.4** Consider designating land within the open space corridor as a Sensitive Resource Zone. Low impact development standards should be implemented in these areas.

**Implementing Actions**

The following list of actions need to be completed in order to implement the policies contained within this plan. They are arranged according to the timeframe within which each should be completed: short, medium, or long term. Short-term actions should occur within one year of plan adoption. Mid-term actions should be completed within 1-5 years. Long-term actions should be completed within 5-10 years of plan adoption. The entity or entities responsible for leading the effort to complete the action item is listed in parenthesis following the action. Actions are assigned to the Land Use Advisory Commission (LUAC), Pierce County Planning and Land Services (PALS), Pierce County Economic Development (ED), Pierce County Parks and Recreations (Parks), Pierce County Public Works & Utilities (PWU), Tacoma-Pierce County
Health Department (TPCHD), Pierce County Assessor, Pierce Conservation District (PCD), Key Peninsula Community Councils, and the Key Peninsula Business Association.

**SHORT TERM ACTIONS (UPON PLAN ADOPTION TO 1 YEAR)**

1. Amend the Pierce County Development Regulations – Zoning (Title 18A) to:
   - Provide incentives that encourage environmentally sound development practices and the use of Best Management Practices. (PALS, PWU)
   - Provide incentives for land owners to implement farm plans. (PALS, PCD)
   - Require new commercial development to provide low-flow, drip irrigation techniques in required landscaping areas where supplemental water is necessary for the survival of plantings. (PALS)
   - Restrict livestock access to lakes, streams and wetlands. (PALS)

2. Amend Title 18J, Design Standards and Guidelines to:
   - Encourage innovative design solutions, including low impact development techniques, to reduce impervious surfaces and promote aquifer recharge. (PALS)
   - Require any open space dedication for new development be located adjacent to other open space tracts, wooded areas or critical areas. (PALS)
   - Minimize outdoor light pollution to ensure light does not impact neighboring businesses or residential homes while ensuring lighting standards provide for visibility and safety of outdoor spaces. (PALS)

3. Amend Title 18E, Critical Areas to:
   - Designate areas that are at increased risk of groundwater contamination as aquifer recharge areas. (PALS)
   - Consider waiving additional critical area assessments and studies on sites containing several critical areas when a buffer is established exceeding the maximum buffer requirement for all remaining critical areas. (PALS)

4. Provide property owners with information regarding seawater intrusion and techniques for prevention. (PALS, TPCHD)

5. Enforce the requirement of the 50-foot wide buffer adjacent to SR 302 and the Key Peninsula Highway. Require reforestation of any buffer that has been removed or degraded. (PALS)

6. Continue to designate staff resources to specific geographical areas to facilitate staff expertise in individual communities. (PALS)

7. Continue to support the "permit ombudsman" position to facilitate the permitting process and resolve disputes between permit applicants and PALS. (PALS)

8. Encourage low impact development techniques along marine shorelines. (PALS, PWU)

9. Update the Countywide Openspace/Greenbelt Map to reflect local conditions. (PALS)
**Mid-Term Actions (1-5 years)**

1. Offer a variety of educational materials to private property owners regarding Best Management Practices for environmental stewardship on the Key Peninsula. (PALS, PWU, PCD, FARM, TPCHD)

2. Require that landowners conducting agricultural operations implement farm best management practices to address, at a minimum, livestock waste and surface water protection prior to receiving property tax relief through the Current Use Assessment program (PALS, Parks, Assessor, PCD)

3. Consider amending Current Use Assessment program to provide a tax incentive on properties that make improvements that reduce downstream pollution or conserve freshwater resources. (PALS, Parks, Assessor)

4. Evaluate the feasibility of providing local government services in the community such as a satellite development center office. (PALS)

5. Develop a process for Planning and Land Services staff to conduct site visits at the request of the property owner to determine the presence or absence of regulated critical areas prior to development permit application submittal. (PALS)

6. Pursue grants and other alternative funding options to conduct critical area inventories on the Key Peninsula. (PALS, PWU)

7. Complete an update to the Pierce County Shoreline Master Program. Actions to be considered in the SMP update should include:
   - Updates to the shoreline environment designations. (PALS)
   - Identification of potential locations for additional public access including unopened County road ends. (PALS)
   - Establishment of best management practices for aquaculture. (PALS)
   - Incentives for beach nourishment or other soft armoring techniques. (PALS)
   - Standards that would require construction of non-water dependant structures at a sufficient distance from the ordinary high water mark to ensure that bulkheads are not necessary for the lifetime of the structure. (PALS)
   - Protection of sand spits by discouraging new bulkheads below feeder bluffs. (PALS)
   - Discouraging new dock and pier construction except for public use facilities. (PALS)
   - Prohibiting dredging activities. (PALS)
   - Incentives that encourage the retention of native vegetation along marine shorelines. (PALS)
   - Require habitat restoration plans for any shoreline development proposal on a site that has an existing shoreline violation. (PALS)
   - Incentive-based process to encourage the removal of bulkheads and other hard armoring along marine waters. (PALS)

8. Provide informational materials that promote best management practices and environmental stewardship at public agencies including the Pierce County Building Department and the Tacoma Pierce County Health Department. (PALS, TPCHD)
9. Provide a list of bulkhead design options that encourage alternatives to traditional concrete, rock or timber bulkheads. (PALS, PWU, TPCHD)

10. Provide pier and dock design options that utilize grated surfaces which allow light to pass though the pier or dock instead of traditional construction methods. (PALS, TPCHD)

11. Identify point and non-point sources of pollution that affect shellfish beds. (PWU-Water Programs, TPCHD)

12. Promote the use of the Pierce County Conservation Futures program and the Current Use Assessment-Public Benefit Rating System on the Key Peninsula through workshops, newspaper advertisements and direct mailing to eligible property owners. (PALS, Parks, Assessor).

13. Work with the Department of Natural Resources regarding forest practices on the Peninsula. Provide the DNR with information regarding community plan priorities and local critical area regulations. Encourage the DNR to meet local standards. (PALS)

**LONG TERM ACTIONS (5-10 YEARS)**

1. Require that educational information regarding shoreline BMPs is distributed to new shoreline property owners when the property is transferred. (PALS, TPCHD, PWU, PCD)

2. Encourage properties with livestock confinement areas to initiate or update a site specific farm plan when the property changes ownership. (PALS, PCD)

Additional erosion or landslide hazard areas may exist outside these boundaries. This is not a survey. The County assumes no liability for variations associated with aerial surveys. ALL DATA IS EXPRESSED AS IF AERIAL PHOTOGRAPHIC.
Chapter 5: Economic Element

Description of Current Conditions

The economic character of the Key Peninsula is rural with a predominance of small retail businesses which provide goods and services mainly to the local population. They also cater to a significant secondary market, serving the large influx of people occupying vacation homes, visiting the many camps in the area, or enjoying the two State Parks. The area also hosts a variety of home-based businesses, many of which are agriculture-related, including a number of breeders of prize-winning livestock. Firms working in the construction industry also constitute a large share of the home-based businesses.

While there is strong business activity in the plan area, most residents still commute to jobs located in Gig Harbor, Tacoma, Kitsap or King County, or other locations outside the Peninsula. Because their travel to work takes them to areas with abundant opportunities to obtain goods and services, many of their purchases are made outside the Key Peninsula. That dynamic makes starting and maintaining a retail business difficult. The challenge for businesses is to find the products and services that are in demand and can be supported by the local market.

Income

Residents of the Key Peninsula had a median household income of about $49,000. That income is 108% of the Pierce County median household income of $45,204. Figure G-1 shows income distributions of households in the Key Peninsula area compared to Pierce County as a whole. The incidence and characteristics of poverty on the Key Peninsula also differ from Pierce County as a whole. Table G-7 shows the percentage of people with incomes below the poverty threshold on the Key Peninsula is about 8.3%, whereas the figure for Pierce County is 10.5%. The table also shows the Key Peninsula exhibits a lower incidence of poverty among children, but a higher incidence among seniors than Pierce County.

Industry and Employment

As shown in Table G-8, there are approximately 387 total firms operating on the Peninsula, which employ some 1,270 people. Those firms are widely disbursed throughout the Peninsula, with concentrations in Key Center, Home, and the Lake Kathryn/Horseshoe Lake areas. Public employers account for nearly 3% of the firms in the area, but account for 18% of the employment, mostly in public schools. The largest private industry sectors include: agriculture, logging and shellfish; business and professional services; construction, and; retail trade. Employment is fairly even between those sectors, with construction slightly higher than the others at nearly 16%.

Retail Sales

As shown above, there are about 387 firms on the Key Peninsula which have employees covered by the Unemployment Insurance program. However, the Department of Revenue shows that in 2004 there were 491 firms reporting taxable retail sales. As shown in Table G-9, that number increased steadily from 2000 through 2004, as did total taxable retail sales. Inflation adjusted taxable retail sales per firm increased by 9.7% in the period 2000 through 2004 (Figure G-2).

WORKFORCE

Workforce characteristics are similar to Pierce County as a whole, with some notable exceptions. As shown in Table G-10, a slightly higher percentage of people age 16 and over are not in the workforce and a considerably smaller portion are in the military. Table G-11 shows that a substantially larger percentage of the workforce is self employed. Regarding occupations, residents of the Key Peninsula are employed similarly to residents of Pierce County as a whole, as shown in Table G-12, with some under representation in Sales and Office occupations, and over representation in Construction, Extraction and Maintenance. Finally, Table G-13 shows that about 72% of residents commute 30 minutes or more to work, and about 25% commute less than half an hour. About 3.3% work at home, which is comparable to the Pierce County rate of 3.6%.

</table>
DESCRIPTION OF DESIRED CONDITIONS

Residents of the Key Peninsula value the rural character and renewable resource heritage of their community. They would like to have more professional services available within the plan area, but not at the expense of their rural way of life. Providing more employment opportunities for local residents is a priority for this plan. However, while more job opportunities on the west side of the Narrows Bridge are desired, people also recognize the occupations of many residents will dictate they commute to more urbanized areas for work.

As in many rural areas, independence, self-reliance and entrepreneurship are highly valued on the Key Peninsula, and the area has a long tradition of entrepreneurs operating businesses at their homes. This plan should support that tradition. Home-based business can encompass a wide range of activities, from on-line merchandising to value-added agricultural products to creative arts and more. In order for home-based businesses to thrive, certain infrastructure and services are necessary. The plan should also recognize that as a home-based business becomes successful it may outgrow its place of birth and should at some point move to an area where it can better serve its clientele without impacting neighboring residences.

Renewable resources are an area of strength for the Key Peninsula. In particular, shellfish and aquaculture, forest products and agriculture present economic opportunities. Operations that add value to renewable resources should be encouraged, as long as those operations are compatible with the rural character and maintain a clear distinction between commercial and residential areas.

Promoting tourism on the Key Peninsula is seen as a way to capitalize on the stunning natural attributes of the area. It is also seen as an opportunity to create new markets for the agricultural industry by promoting agricultural tourism. The Key Peninsula’s significant stretches of shorelines and open space present an opportunity to develop a strong industry based on recreational tourism. Proximity to urban areas with large residential populations and a burgeoning convention trade makes the area particularly attractive for day trips and overnight stays. Land use, facilities and infrastructure development policies should support recreational tourism. A strong tourism industry is only possible if there are adequate recreational opportunities and transportation access to the Peninsula.

Maintaining the look and feel of the built environment is an important part of retaining the identity of the Key Peninsula and therefore a key component in expanding the tourism market. New commercial development should be architecturally consistent with the area’s rural heritage while exhibiting enough variety to maintain the character of established commercial nodes. In order for regulation of design for commercial buildings to lead to an enhanced business climate, the standards must be financially feasible for small businesses.
ECONOMIC DEVELOPMENT POLICIES

GOALS

Providing employment opportunities for local residents is a community priority. Encourage home occupations and cottage industries that minimize impacts to neighbors. Promote jobs related to tourism including community based events such as a farmers market. Utilize natural resource lands to provide local jobs. Rural activity centers should be the focal point for local job opportunities. Encourage local government to look for opportunities to streamline the permit processes to facilitate economic development.

GENERAL

GOAL KP EC-1  Encourage a positive business climate that fosters job growth in a rural context.

KP EC-1.1  Look for opportunities to streamline the permit process so that it is understandable, predictable, flexible, and affordable.

KP EC-1.1.1  Explore opportunities to establish an office on the Key Peninsula to provide County information and permitting services.

KP EC-1.1.2  Provide adequate staffing levels in the County permitting departments so specific employees can be familiar with and provide consistent implementation of the specific development requirements on the Key Peninsula.

KP EC-1.2  Explore opportunities for establishing development standards for rural areas that would take into account the differences between urban development requirements and rural development needs.

KP EC-1.2.1  Consider site-specific flexibility in the permitting process based on local conditions and performance standards.

KP EC-1.3  Consider the establishment of design standards for new commercial businesses in rural commercial centers that would enhance the economic development of these areas.

KP EC-1.3.1  Any commercial design standards should be developed with significant input from the business and development community to assure they are financially feasible for small business.

KP EC-1.3.2  New commercial development may be architecturally consistent with the area’s rural heritage while exhibiting enough variety to maintain the character of established commercial centers.

KP EC-1.3.3  Explore the possibility developing an architectural style that would provide a sense of place or unique characteristic for one or more of the rural commercial centers on the Key Peninsula.
KP EC-1.4  Explore alternatives for funding infrastructure development.

KP EC-1.4.1  Develop a system to allow latecomer fees or other mechanism that recognizes cumulative impacts of development and spreads the cost of infrastructure development across all beneficiaries.

KP EC-1.4.2  Explore options for generating revenue for transportation infrastructure development on the Peninsula, assuring that revenue generated stays in the plan area.

KP EC-1.4.3  Encourage the establishment of a Main Street Association in Key Center which could use tax incentives to facilitate development of sidewalks, streetscape improvements, infrastructure, and other amenities in the commercial area.

KP EC-1.5  Encourage additional educational facilities to locate in the plan area.

KP EC-1.5.1  Support workforce and vocational training opportunities or any specialized educational facilities which may locate in the plan area.

KP EC-1.5.2  Consider utilizing a portion of Washington State’s Department of Natural Resource property for an educational facility that would provide training for local jobs.

KP EC-1.5.3  Support expansion of public transportation services between the Key Peninsula and educational facilities outside of the plan area.

KP EC-1.5.4  Work with Tacoma Community College and other educational institutions to increase the availability of educational opportunities within the plan area.

KP EC-1.5.5  Support development of a facility to be shared by Pierce County permitting agencies, regional educational institutions, and other public or private agencies, and a small business incubator.

KP EC-1.5.6  Encourage the development of private educational facilities for K-12 within the plan area.

**Home Occupations and Cottage Industries**

**GOAL KP EC-2**  Encourage the establishment of home-based businesses and cottage industries throughout the community.

KP EC-2.1  Encourage home occupations that range from on-line merchandising and services provided via the internet, to the arts, to small-scale fabrication and manufacturing, and more.

KP EC-2.2  Review the existing Development Regulations for home-based business to ensure that the regulations are appropriate for operating a business in the rural area.

KP EC-2.3  Ensure that home occupations do not result in adverse impacts to surrounding neighbors.
KP EC-2.3.1 Ensure that regulations affecting home-based businesses do not negatively impact the entrepreneurship, innovation, and new product development that are often the result of successful home occupation businesses.

KP EC-2.4 Recognize that as certain home-based businesses become successful they may create impacts that are inappropriate in residential areas.

KP EC-2.4.1 Support an adequate amount of commercially zoned land to support the transition of home-based businesses into commercial areas.

KP EC-2.4.2 Ensure a process to re-evaluate the amount of commercially zoned land if a shortage becomes apparent.

KP EC-2.4.3 Enforce regulations restricting the size and operation of home-based businesses.

KP EC-2.4.4 Support, when necessary, the relocation of home-based businesses to commercial zones by providing entrepreneurs with access to information regarding the resources of agencies such as the Pierce County Economic Development Board (EDB) and available incentives.

KP EC-2.5 Recognize the service needs of home-based businesses.

KP EC-2.5.1 Encourage providers of public services, especially the postal service, to consider the needs of home-based businesses when determining hours of operation.

KP EC-2.5.2 Encourage operators of broadband telecommunications infrastructure to provide high-speed internet access to all parts of the plan area.

KP EC-2.5.3 Encourage cellular communication companies to provide complete coverage to all parts of the plan area while co-locating communication equipment on existing towers whenever possible.

**NATURAL RESOURCE INDUSTRIES**

**GOAL KP EC-3** Support the retention and development of natural resource-based industry such as local aquaculture, local agriculture, and local forest product uses.

KP EC-3.1 Encourage the harvesting, processing, and merchandising of non-timber forest products such as brush and huckleberry picking.

KP EC-3.2 Define levels of intensity for sawmills to accommodate small custom milling operations on rural and resource lands or as a cottage industry.

KP EC-3.3 Provide greater flexibility in the type of uses permitted as accessory uses on designated resource lands.

KP EC-3.4 Ensure adequate accessory uses are allowed on agricultural lands to permit production, processing, and merchandising of agricultural products.

KP EC-3.5 Encourage sustainable natural resource harvesting practices.
Allow farmers to actively farm their property by maintaining pastureland.

TOURISM

GOAL KP EC-4  Capitalize on the unique scenic beauty and proximity to urban areas by promoting economic development opportunities through tourism.

KP EC-4.1  Provide opportunities for Master Planned Resorts in the community.

KP EC-4.2  Support the development of a destination resort on the Key Peninsula that would provide local jobs.

KP EC-4.3  Encourage a Master Planned Resort that is compatible with the existing rural character of the Key Peninsula.

KP EC-4.4  Utilize opportunities associated with parks, trails, and recreational facilities for economic development.

KP EC-4.5  Identify tax incentives or density credits for public and private developers who choose to provide public access to parks, trails, shorelines, and other passive recreational areas.

KP EC-4.6  Ensure lodging facilities are allowed uses throughout the Key Peninsula.

KP EC-4.7  Review the Zoning Code and allowed use tables to ensure lodging facilities of appropriate size and scale are allowed uses in the plan area.

KP EC-4.8  Allow lodging facilities with up to 20 guest rooms to locate in rural residential locations and allow lodging facilities with more capacity to locate only in Rural Activity Centers.

KP EC-4.9  Apply design standards to new lodging facilities located inside of the plan area.

KP EC-4.10  Encourage the development of a tourism web site, special events calendar, community bulletin board, or visitor information center.

KP EC-4.11  Support development of public restrooms in Key Center.

IMPLEMENTING ACTIONS

The following list of actions need to be completed in order to implement the policies contained within this plan. They are arranged according to the timeframe within which each should be completed: short, medium, or long term. Short-term actions should occur within one year of plan adoption. Mid-term actions should be completed within 1-5 years. Long-term actions should be completed within 5-10 years of plan adoption. The entity or entities responsible for leading the effort to complete the action item is listed in parenthesis following the action. Actions are assigned to the Land Use Advisory Commission (LUAC), Pierce County Planning and Land Services (PALS), Pierce County Economic Development (ED), Pierce County Parks and Recreations (Parks), Pierce County Public Works & Utilities (PWU), Tacoma-Pierce County Health Department (TPCHD), Pierce County Assessor, WSU Extension, Pierce Conservation
District (PCD), Farm Assistance Revitalization & Marketing Program (FARM), Key Peninsula Community Councils, and the Key Peninsula Business Association.

**SHORT TERM ACTIONS (UPON PLAN ADOPTION TO 1 YEAR)**

1. Amend the Pierce County Development Regulations – Zoning (Title 18A) to:
   - Allow educational facilities in appropriate zones within the plan area. (PALS)
   - Allow master planned resorts and other lodging facilities in appropriate locations within the plan area. (PALS)
   - Provide a range of senior housing types, densities, and facilities for seniors such as medical and personal services in rural activity centers. (PALS)
   - Provide greater flexibility in the type of uses permitted as accessory uses on designated resource lands. (PALS)
   - Review the existing development regulations for home based business to ensure that the regulations are appropriate for operating a business in the rural area. (PALS)
   - Authorize lodging facilities to locate throughout the community when applicable design standards are met. (PALS)

2. Amend Pierce County Development Regulations - Design Standards and Guidelines (Title 18J) to establish design standards for new commercial businesses in rural commercial centers that would enhance the economic development of these areas. (PALS)

**MID-TERM ACTIONS (1-5 YEARS)**

1. Pursue opportunities to improve and streamline the County permit process. (PALS, LUAC, ED)
2. Explore opportunities for establishing development standards for rural areas that would take into account the differences between urban development requirements and rural development needs. (PALS, ED, PWU)
3. Explore alternatives for funding infrastructure development in rural commercial centers including programs that spread the cost of infrastructure across all beneficiaries. (PALS, ED)
4. Work with the Key Peninsula Business Association to establish a “Main Street Association” in Key Center which could use tax incentives to facilitate development of sidewalks, streetscape improvements, infrastructure, and other amenities in the commercial area. (PALS, PWU, ED, Key Peninsula Business Assoc.)
5. Amend Title 18A, Zoning to incorporate operational standards that serve as a guide for when a home-based business should relocate into a designated commercial area. (PALS, Economic Development)
6. Identify tax incentives or density credits for public and private developers who choose to provide public access to parks, trails, shorelines, and other passive recreational areas. (PALS, Parks, Assessor)
7. Conduct an inventory of public access points to marine shorelines and watercourses within the plan area to determine best locations for aquatic recreation areas. (PALS,
8. Review standards contained in development and construction and infrastructure regulations to determine if the thresholds for home occupations, Cottage Industry I, and Cottage Industry II categories are appropriate for the rural area. (PALS, LUAC)

LONG TERM ACTIONS (5-10 YEARS)

1. Look for opportunities to establish an office on the Key Peninsula to provide County information and permitting services. (PALS, PWU, ED, PCD)
2. Ensure that an adequate amount of commercially-zoned land is available to support the transition of home-based businesses into rural commercial areas. Evaluate the amount of vacant and developable land in rural commercial centers every five years. (PALS, ED, LUAC)
3. Support development of a facility to be shared by Pierce County permitting agencies, regional educational institutions and other public or private agencies, and a small-business incubator. (PALS, ED)
4. Support development of public restrooms in Key Center. Pursue public/private partnerships, grant funding, land donations and other opportunities that would facilitate this project. (PALS, Parks, ED, LUAC, Key Peninsula Business Assoc, Key Peninsula Community Council)
5. Work with local agencies and groups to develop a farmers’ market within the plan area. (PALS, ED, Key Peninsula Business Association, Farm Bureau, WSU Extension, Farm Assistance Revitalization & Marketing Program (FARM))
6. Work with local agencies, businesses and citizen groups to promote tourism related business and activities within the plan area. (PALS, Parks, ED, Key Peninsula Business Association)
7. Encourage operators of broad-band telecommunications infrastructure to provide high-speed internet access to all parts of the plan area. (ED)
8. Encourage cellular communication companies to provide complete coverage to all parts of the plan area while co-locating communication equipment on existing towers whenever possible. (ED)
9. Explore the viability of establishing a reserve area for a New Fully Contained Community (NFCC) in conjunction with the development of a new east-west transportation corridor within the community plan area. (PALS, LUAC)
Chapter 6: Facilities and Services Element

**INTRODUCTION**

The Facilities and Services Element articulates needs for facilities and services to implement the visions and goals of the Key Peninsula Community Plan. Facilities and services are collectively considered infrastructure and may include public or privately funded projects. Policy statements regarding infrastructure provide direction to investors and decision-makers about investments desired and needed by the community. This element also prioritizes some of the projects and may suggest potential funding sources to acquire or construct facilities or provide services.

**DESCRIPTION OF CURRENT CONDITIONS**

**CAPITAL FACILITIES PLANNING IN PIERCE COUNTY**

The Pierce County Comprehensive Plan contains a Capital Facilities Element, often referred to as the Capital Facilities Plan (CFP). The CFP is a six-year plan for identifying and financing Countywide capital improvements that support the County’s current and future population and designated land uses. The CFP is based on projected needs for capital facilities for the next 20 years, given current trends and expenses and is updated annually. Application of level of service (LOS) standards is a method for identifying needed capital improvements. LOS standards state the acceptable quantity and quality of a facility or service; expressed as unit of population, housing, acreage, square footage, gallons, vehicles per hour, waiting time, or similar unit of measurement.

**PARKS AND RECREATION**

**HISTORY OF PARKS AND RECREATION PLANNING IN PIERCE COUNTY**

Prior to 1958, the Metropolitan Park District of Tacoma provided most of the park facilities and recreation programs throughout Pierce County. In 1958, the Board of Pierce County Commissioners created the Department of Parks and Recreation for Pierce County. At that time, several park sites outside the City of Tacoma were conveyed to Pierce County. The Pierce County Parks Department continued to grow in the 1980s and 1990s and established many recreational programs such as the All Abilities Camp, Sound to Narrows Race, mobile recreation, ski school, martial arts, aerobics, Tour de Pierce, Carless Commute, Cooperative Playshops, and sports leagues.

The Pierce County Comprehensive Plan contains general policies that serve as a guide for future development of park and recreation facilities in the County. These policies cover a range of issues including the County’s responsibility in providing parks, technical assistance to local park associations, and include criteria for new park development. Section 19A.20.090 of the
Comprehensive Plan states that the primary reliance is upon cities and towns and special purpose districts to provide local park facilities and services appropriate to serve local needs. The location criteria for park and recreation areas states that new parks must be located on public roads. Open space passive recreation parks should be located on land offering significant environmental features.

The Pierce County Comprehensive Park, Recreation, and Open Space Plan (referred to as the Parks Plan) provides general direction and guidance for both facilities and programs. The Parks Plan does not contain project specific plans for the County’s park properties.

In 1994, Pierce County adopted a Comprehensive Park, Recreation, and Open Space Plan for the Gig Harbor and Key Peninsulas. This plan is often referred to as the Draggoo Study. The primary goals of this plan were to:

- Provide a full range of park and recreation services for all age groups and interests.
- Provide and support an efficient management structure that preserves local control and provides a system approach to the provision of park and recreation services.
- Reduce the burden on schools in providing for community recreation needs.
- Preserve and protect important natural areas for parks, trails, open space and shoreline use.
- Develop and support a broad and reliable funding base to support plan implementation and long-term provision of park and recreation services.
- Ensure that recreation program needs are met.

The 1994 plan specifically addressed and made recommendations for levels of service for neighborhood parks, school parks, community parks, natural open spaces, regional parks, and special use areas such as boat launches, shoreline access points, trails and indoor recreation spaces. Pierce County did not implement this park and recreation plan, principally because the LOS standards recommended in the plan were greater than described in the Countywide Capital Facilities Plan.

KEY PENINSULA METRO PARKS

The Key Peninsula Metropolitan Park District (KPMPD) was formed by a special election in May of 2004 with over 60% voting in favor to form the district. KPMPD is the successor to Key Peninsula Parks & Recreation District, which was created in a 1972 general election. The current funding source for the KPMPD is the ZooTrek sales tax, collected by Pierce County.

The park system includes the Key Peninsula Sports Complex and Fairgrounds and Home Park. KPMPD and Pierce County cooperatively manage the Rocky Creek Conservation Area. The Park District is also in the process of acquiring approximately 360 acres from the State of Washington Department of Natural Resources. A five-member Board of Commissioners govern the Key Peninsula Metropolitan Park District. Commissioners serve six-year staggered terms.
and are the legislative body responsible for adopting the District budget and developing goals, policies and regulations, which will guide the District’s future.

Pierce County Parks works closely with the KPMPD. Pierce County anticipates that the KPMPD will be the primary Park and Recreation provider on the Key Peninsula in the future.

**DOMESTIC WATER**

The Department of Ecology issues water rights in Washington State. A water right is a legal authorization to use a certain amount of public water for specific beneficial purposes. State law requires every user of streams, lakes, springs, and other surface waters to obtain a water right permit unless they use 5,000 gallons or fewer each day. A water right will be issued only if it is determined that water withdrawal will not have a detrimental effect on other nearby wells. Water rights are based on anticipated average daily flows from the proposed use and are approved for a specified number of wells.

**OVERVIEW OF DOMESTIC WATER SUPPLY AND WATER SYSTEM PLANS, POLICIES AND REGULATIONS**

Numerous water related plans, programs or processes occur at the State, County, Water Resource Inventory Area (WRIA), and individual water system service area level. The Pierce County Comprehensive Plan, the Pierce County Coordinated Water System Plan - 2001, the Key Peninsula Gig Harbor Islands Watershed Characterization and Action Plan - July 1999, the Key Peninsula Islands Basin Plan - June 2006, and individual water purveyor water system plans address domestic water supplies in some manner. Additionally, numerous regulations impact the provision of water service, including the Pierce County land use development regulations. A draft watershed plan was developed for Water Resource Inventory Area 15 - Kitsap Peninsula and Islands in June 2005 but was not completed. Consensus between the watershed committee members could not be reached. The Squaxin Island Tribe voted against the plan.

**WATER SYSTEMS SERVING THE PLAN AREA**

Domestic water within the plan area is provided by a combination of individual on-site wells, small “Group B” water systems, and larger “Group A” water systems. Currently within the plan area, there are 58 “Group A” water systems that have either 15 or more connections or serve 25 or more people per day for 60 or more days per year regardless of the number of connections. Fifty-five separate water purveyors are responsible for operating these systems. Major purveyors on the Key Peninsula include Washington Water Service, Herron Maintenance Water System, and the Bruce Cole Water System. As required by state law, water service areas are exclusive service areas, which means only the designated purveyor is authorized to provide public water service to properties within their individual service area. Outside designated water service areas, wells exempt from the requirement to obtain a water right are expected to provide water service for new growth. These individual “exempt” wells or small “Group B” public water systems (utilizing an exempt well to provide 2-14 connections) are most likely to occur in the future. There is not a complete inventory of individual wells or Group B systems located on the Key Peninsula at this time.
ISSUES FACING WATER PURVEYORS

Generally speaking, providing a safe, sustainable supply of water to a growing population is getting more and more difficult for water purveyors across the state. Balancing the need for water for people with the needs of fish, wildlife, and the natural environment is a major challenge. Fresh water is a finite resource with a growing demand and how we live and use water have significant cumulative impacts on how much water is available and how clean the water is. Educating users of water in a typically wet western Washington environment is a challenge facing policy makers and water purveyors. Many property owners and water users lack a basic understanding of the interaction between groundwater and the saltwater in our shoreline locations, between aquifers and freshwater streams, and generally lack the knowledge of how much water can be withdrawn before problems occur. In an area like the Key Peninsula which is totally dependent on groundwater for supply, it is important to have a water budget to understand the quantity of water available for current users and growth. A detailed water budget has not been completed for the Key Peninsula at this time. Essentially, how to manage the water resources into the future is at issue.

Pierce County policy makers and local water purveyors promote water conservation methods as a means of ensuring sufficient water supplies for growth. Conserved water is water that does not have to be purchased or conveyed so it is cost effective. Water conservation can be frustrated by development regulations and homeowner covenants that require extensive irrigated landscaping and similar features. Water conservation can be enhanced by requiring plumbing fixtures that conserve water, instituting leak detection and correction programs, and by developing strict irrigation and landscaping standards. Care in requiring landscaping that does not demand extensive irrigation for its survival will help, as will emphasis in landscaping standards that require the use of native plant materials and in land clearing regulations that limit the extent of native vegetation removal.

At this time, it can be extremely difficult, if not impossible, to obtain a new water right from DOE due to staffing limitations, lack of needed information, and the closure status of streams, among other reasons. How to balance water resource needs into the future, thereby providing water for both instream and out of stream uses, is an important issue facing many areas of the state, including Pierce County and the Key Peninsula Community Plan area. The failure to complete the Kitsap Peninsula and Islands - Water Resource Inventory Area 15 watershed plan may have a negative impact on the ability for new water rights to be attained in the future.

SEPTIC SYSTEMS AND WASTEWATER DISPOSAL

As part of a strategy to guide urban intensity development into designated urban growth areas, the Pierce County Comprehensive Plan directs that sanitary sewers be provided almost exclusively to urban areas. The entire Key Peninsula Community Plan area is designated as rural under the County Comprehensive Plan and as a result, sewer service is generally not available. One exception to this is the sewer system at Taylor Bay. This system was developed for a moderate-density subdivision before the Growth Management Act was implemented by Pierce County. All other areas of the Key Peninsula utilize septic systems for wastewater disposal.
SOLID WASTE

Solid waste management in Pierce County is governed by the Tacoma-Pierce County Solid Waste Management Plan, which under state law is an integrated system plan addressing all issues related to solid waste collection, disposal, and processing. The following solid waste management services are provided to residences and businesses in the Key Peninsula Community Plan area:

- **Refuse collection service** is provided to residential and commercial customers by American Disposal, franchised under the authority of the Washington Utilities and Transportation Commission. Waste Connection of California is the parent company of American Disposal.

- **American Disposal** provides curbside pickup of recyclables, including mixed waste paper, cardboard, newspaper, glass, and cans to single-family and multifamily residential customers. Commercial recycling programs are offered by American Disposal upon request.

- **Key Center Drop Box Transfer Station** near Key Center accepts household trash, recyclables and yard waste. Commercial or industrial waste is not accepted at this time.

- **The Purdy Transfer Station** located near Purdy on the Gig Harbor Peninsula at 14515–54th Avenue NW also provides recycling facilities as well as disposal services for appliances and other non-hazardous solid waste for plan area residents. A new household hazardous waste facility is anticipated to be constructed at this location in 2007.

- **American Disposal** provides yard waste containers and pick-up for plan area residents once per week and residents can also utilize the Purdy Composting Facility at the Purdy Transfer Station for disposing of large amounts of debris.

- Under an agreement with the City of Tacoma, Pierce County residents may dispose of their **household hazardous waste** at the Tacoma Landfill Hazardous Waste Collection Facility located at 3510 S. Mullen in Tacoma. The facility is open seven days per week and a list of materials accepted and not accepted at the site is available.

The existing solid waste facilities within the community plan area are described in Table G-14.

</tr>
</tbody>
</table>

Solid waste that is not disposed of correctly can result in a variety of negative environmental consequences. Household hazardous waste can damage aquifers and the water quality of streams when gasoline, oils, and antifreeze are disposed of improperly. The short ravines commonly found in the Key Peninsula area can be a popular target for people looking to illegally dump garbage, yard waste, appliances, tires, hulks, and even commercial waste. Yard waste and grass clippings are the most common items dumped by adjacent landowners.
ILLEGAL DUMPING AND JUNK VEHICLES

Pierce County Responds is the County’s program to provide a comprehensive response to the problem of illegal dumping of waste and nuisance vehicles. The Solid Waste Division maintains a hotline to receive and investigate illegal dumping and nuisance vehicle complaints. Within the authority of this program, the County offers a cooperative abatement system to assist with cleanup of waste and vehicle removal, recommends cases for prosecution, effects site cleanups, and promotes citizen involvement in litter cleanup activities. The program brings together the staff and resources from the departments of Public Works and Utilities, Planning and Land Services, Community Services, Sheriff, Prosecuting Attorney and the Tacoma-Pierce County Health Department. Information about the program can be found at: www.piercecountyresponds.org.

FIRE PROTECTION

Fire District No. 16 serves the entire Key Peninsula. It was voted into existence in 1952 by the citizens of the Key Peninsula. In the early 1960s the Firefighters Association formed the ambulance service. The district has six stations located throughout the Peninsula. Table G-15 describes each station, location and equipment.

</table>

The district runs several special operations teams including water rescue, wildland firefighting, high angle rope rescue and also operates a fire boat. The district responded to 1,768 calls in 2005 with calls increasing by approximately 15% in 2006 averaging just over five calls per day. Approximately 80% of all calls relate to medical aid or rescue.

**Electric Systems**

Electric power is supplied to the plan area by Peninsula Light Company. Peninsula Light was established in 1925 as a non-profit member-owned utility. Peninsula Light currently serves approximately 30,000 members in a 107-square mile area of Pierce County west of the Tacoma-Narrows Bridge. The service area includes Key Peninsula, Gig Harbor Peninsula, Fox Island, Tanglewood Island, Raft Island, and Herron Island. Approximately 13,500 of these electrical connections are within the Key Peninsula Community Plan area.

**Transportation**

**Roadways**

The roadway network in Key Peninsula is primarily made up of two-lane roads that follow the natural contours of the existing topography. Similar in ways to the Gig Harbor Peninsula, the roadways are not aligned in a grid pattern that is commonly found in more urbanized areas. The intersections are characterized by approaches that come in at tightly skewed angles. Many of the roadways are narrow and without shoulders. The adjacent topography, trees, and other environmental features complicate the widening of these roadways.

Access into and out of the Key Peninsula is primarily from State Route 302 (SR 302), which is a two-lane highway that runs in an east-west direction in the northern portion of Key Peninsula between Mason County and Purdy. Traffic levels, including heavy truck traffic, have been increasing on SR 302 through the Key Peninsula area over the years. Traffic backups are commonplace at the SR 302/Purdy Drive NW intersection during the weekday morning commute period and often extend over the Purdy Spit Bridge and into Wauna. Traffic congestion is also heavy at this intersection as well as on the SR 16 off-ramp to SR 302 for motorists heading to Key Peninsula during the evening commute hours. It should be noted that the Washington State Department of Transportation (WSDOT) is scheduled to begin work in...
2007 on an environmental study and preliminary design work for the improvement and potential northerly realignment of the SR 302 corridor through the Key Peninsula.

Key Peninsula Highway is the main north-south thoroughfare that runs almost the entire length of the Peninsula from Longbranch to Elgin. Since Key Peninsula Highway provides direct access to SR 302 and some of the commercial centers in the community plan area, it handles the largest volume of traffic among the County roadways. However, traffic volumes have been gradually growing on the other north-south arterials (Wright-Bliss Road KPN, 118th Avenue NW, and 94th Avenue NW) due to the increase in commuters traveling to and from Kitsap County.

### Nonmotorized Travel

In unincorporated Pierce County, nonmotorized transportation generally refers to facilities that are constructed within the roadway right-of-way and are designed primarily for the use of pedestrians and bicyclists and can also accommodate equestrians. Examples of nonmotorized improvements include sidewalks, shoulders, wide curb lanes, paths, and trails.

Nonmotorized transportation facilities are very limited in the Key Peninsula. With the exception of the paved shoulders along SR 302 and portions of Key Peninsula Highway and Wright-Bliss Road KPN, most of the roadways in Key Peninsula do not have pedestrian or bicycle facilities to accommodate nonmotorized travel. Because of its rural nature, the Key Peninsula does not receive priority in funding for nonmotorized improvements. The area’s lack of nonmotorized facilities along with its minimal transit service results in the community being dependent upon motor vehicles to meet daily travel needs.

### Ferry Service

Regular passenger ferry service to different areas of Key Peninsula was discontinued in the 1940s. There is a privately owned ferry service that runs to Herron Island, located in Case Inlet west of Key Peninsula. The mainland dock for this private ferry is located at Herron Bay at the end of North Herron Road KPN. In operation since 1958, this private passenger and vehicle ferry service runs seven days per week. However, it is restricted to full-time island residents and to visitors with authorized guest passes.

### Transit Service

Pierce Transit provides local transit service to the Key Peninsula area. The rural nature of the Key Peninsula creates unique operating problems for Pierce Transit. Its low population density, discontinuous roadway system, and lack of pedestrian facilities have reduced Pierce Transit’s ability to provide effective public transit service to this area. Pierce Transit operated local fixed route service on a fixed schedule with stops restricted to major roadways until 2000. Because that service did not extend into local residential neighborhoods, which are often removed from
major streets, patronage was low. Fixed route service was eliminated as part of a larger transit reduction in 2000. In its place, Pierce Transit began Bus PLUS service on the Key Peninsula in September of 2003. Bus PLUS is designed to serve neighborhoods that do not have the population densities needed to support fixed route service. This service utilizes smaller buses that are designed to hold a maximum of 15 passengers and can operate on neighborhood streets that are unsuitable for full-sized buses.

Bus PLUS service (Route 113) is currently provided in the Key Peninsula area north of the Home area and includes scheduled bus stops at the Lake of the Woods development, Lake Kathryn Village, Key Center, and along SR 302 and the Key Peninsula Highway. Bus PLUS serves these scheduled stops every two hours during the weekdays. Pierce Transit provides unscheduled service along many other streets including Wright-Bliss Road KPN, Lackey Road KPN, Creviston Drive NW, and Cramer Road KPN. Passengers must contact Pierce Transit in order to make arrangements to be picked up at locations that are not on major streets. In 2005, Pierce Transit averaged 47 riders per day, which is an increase from the previous year (39 riders per day).

Pierce Transit currently leases a Park-and-Ride lot at the Peninsula Market in Key Center that can accommodate up to 20 vehicles. The next closest Park-and-Ride lot is in Purdy. There is a vanpool that originates from Longbranch while other Key Peninsula residents utilize the express and local bus services that operate out of the Purdy Park-and-Ride lot.

**DESCRIPTION OF DESIRED CONDITIONS**

**PARKS AND RECREATION**

**SPECIFIC PARK ACQUISITION SITES**

The community has identified the following sites as potential park and recreation facilities. All park and recreation providers, including Pierce County and the Key Peninsula Metro Park District, and other private organizations should strive to acquire property for parks, trails, and open space before the properties become cost-prohibitive for park and recreation use. The potential acquisition sites that are identified are not listed in order of priority.

</table>
Finding funding sources for acquisition and maintenance of new park facilities is a challenge. However, when properties suitable for parks or trails become available, they should be purchased and put in trust for future development. Existing County-owned land (including road ends at the shoreline) should be reviewed to determine if any portion of these parcels is suitable for parks. Public and private partnerships for development of parks should be encouraged and, where feasible, incorporated into community development projects.

**DOMESTIC WATER**

Groundwater must be managed so that withdrawal rates will not exceed recharge rates in order to preserve the quality and supply of the Peninsula’s groundwater resource. Water conservation measures are encouraged and should be implemented whenever possible. Pierce County Planning, Public Works and Utilities, and the TPCHD should work together to limit new wells and development activities that require water withdrawals in those areas on the Key Peninsula that have been identified as being at risk for saltwater intrusion. Critical aquifer recharge areas throughout the Key Peninsula should be identified and further protected as necessary. Pierce County should implement adaptive management strategies based upon the information received from groundwater monitoring programs.

**SEPTIC SYSTEMS AND WASTEWATER DISPOSAL**

The entire Key Peninsula is designated as a rural area under the County’s Comprehensive Plan. New sanitary sewer facilities are not permitted in the rural area except under specific circumstances involving failing septic systems. In these cases community septic systems may be appropriate. Septic systems should be installed using the latest technology and placed in the most appropriate locations to operate correctly. Special care should be taken when installing septic systems and drainfields near environmentally sensitive areas such as freshwater streams, wetlands, and marine shorelines. Septic systems should be regularly maintained to properly function and if failing systems are discovered, they should be repaired or replace immediately.

**SOLID WASTE**

The Key Peninsula should be provided with an environmentally sound, economically responsible means of solid waste management that balances the need for this service with the costs of waste disposal. Pierce County should encourage recycling and promote programs that reduce the volume of solid waste. Private industry is encouraged to provide sufficient disposal
capacity for waste collection and processing capacity for recyclables produced in the plan area. Affordable recycling options for civic uses and small business should be explored. All residents of the Key Peninsula should have access to refuse disposal, hazardous waste disposal, and recycling collection services.

**FIRE PROTECTION**

Cost effective fire protection services should be maintained in the community. Pierce County and the County’s Fire Prevention Bureau (FPB) should continue to support the efforts of Fire District #16 in responding to the increasing population and demand for services on the Peninsula. The FPB should participate in discussions between the fire district and the water purveyors regarding the maintenance and testing of fire hydrants. Planning and Land Services should work with the fire district to ease the permitting process for construction of fire district facilities. Pierce County should continue to recognize the differences between rural developments and urban projects in fire safety regulations. Enforcement of fire and life safety codes should continue to be part of the review process for all building permits issued by Pierce County.

**ELECTRIC SYSTEMS**

Reliable electrical service should be provided in the community plan area to accommodate growth in a way that balances public concerns over the impacts of utility infrastructure with the consumer’s interest in paying a fair and reasonable price. Peninsula Light Company should consider the community’s natural environment and the impacts that utility infrastructure may have on it together with the community’s desire that utility projects be aesthetically compatible with surrounding land uses when planning for and constructing electrical facilities. Regional electrical facilities should be permitted in the plan area. Pierce County should support expansion of electric utility facilities to meet future load requirements and support new clean energy technologies and conservation measures to aid in meeting future growth needs.

**TRANSPORTATION**

**ROADWAYS**

The policies included in the Key Peninsula Community Plan emphasize the community’s desire to develop a transportation system that accommodates growth and emphasizes safety but still preserves the rural environment of the Key Peninsula. In general, capacity and traffic flow improvements are needed in the northern portion of the Key Peninsula while widening in the southern portion is not deemed necessary due to its smaller population base. A new east-west corridor in the form of a new or improved...
SR 302 corridor is considered crucial to the residential and economic growth of this area. In addition, a north-south alternative to Key Peninsula Highway in the southern portion of the Key Peninsula is needed for emergency access.

The rural character of the Key Peninsula and the County’s funding limitations were also considered in identifying the roadway improvements applicable to the Key Peninsula. The improvement of existing roadways is preferred to the construction of new roadways in order to preserve existing land uses and to protect the natural environment. Intersection improvements are considered a top priority since they reduce congestion, improve safety, and are also cost effective. To further improve traffic flow, policies have been included in the community plan to limit or consolidate the number of new driveways along arterials. Although safety and operational improvements are not typically included in the long-range community plans since those types of improvements are addressed on a case-by-case basis as they arise, the community planning board felt that it was important to include policies that address traffic speeding and pedestrian safety concerns.

A listing of the motorized transportation project recommendations for the Key Peninsula Community Plan area is included in Appendix B. The improvement or realignment of SR 302 is considered a very high priority. Although recommendations for state highway projects are not required in the community plan, the CPB felt that it was important to convey to the County and WSDOT that future improvements to SR 302 is of the utmost importance to the community. Other community priorities include making traffic flow and safety improvements at several intersections on the Key Peninsula Highway and constructing the missing section of 186th Avenue KPN north of Herron Road KPN in order to improve access and emergency response to and from the southern portion of Key Peninsula.

**NONMOTORIZED TRAVEL**

There is strong support among both residents and business owners to create a system of nonmotorized facilities to enhance pedestrian, bicycle, and equestrian travel throughout the Key Peninsula area. Improvements are needed in the commercial centers like Key Center and Home to make them more pedestrian friendly. To enhance safety and to preserve the rural character of the area, there is a preference for walkways that are separated from the roadway. Paved shoulders are recommended on roadways leading to destinations such as schools, parks, playfields, boat launches, transit stops, community facilities, and tourist sites. Bicycle travel should be accommodated throughout the entire length of Key Peninsula, including to Longbranch. Furthermore, any nonmotorized facilities should interconnect with the recreational trails in Key Peninsula as well as other trails in the surrounding areas (e.g., Cushman Trail).

A listing of the nonmotorized transportation project recommendations for the Key Peninsula Community Plan area is included in Appendix B. Community priorities include providing wider and continuous paved shoulders to Key Peninsula Highway, constructing pedestrian improvements in the commercial centers like Key Center and Home, and providing multi-use trails along SR 302 and 144th Street KPN/NW (Powerline Road).
Ferry Service

There are no plans at this time to initiate public or private ferry service to the Key Peninsula.

Transit Service

Although local residents realize that the Key Peninsula may not have the population base to support fixed bus route service, there is a desire for increased and more reliable transit service for local residents traveling within and outside of the Key Peninsula area. While service increases and transit improvements for the Key Peninsula are not currently listed as a priority in Pierce Transit’s Six-Year Transit Development Plan, the transit agency is anticipating that the need for more “hybrid” services, such as Bus PLUS and vanpools, will expand for this area in the future.

Local residents have shown support for increasing the frequency and service area for the Bus PLUS service in Key Peninsula. Some commuters would like to see the Bus PLUS run on an hourly basis on weekdays and also operate on weekends. There has also been public support for extending the Bus PLUS zone from the current terminus in Home south to Longbranch. More frequent Bus PLUS service during commute hours to the Purdy Park-and-Ride lot is recommended in order to provide more timely connections with the express bus service to Tacoma and Seattle. The expansion of local and express bus routes is also highly desired.

As the demand for express bus and vanpool services continues to grow, Pierce Transit anticipates that existing Park-and-Ride lots in Purdy and at the Peninsula Market in Key Center will become overcrowded. Community members have also suggested that another Park-and-Ride lot is needed in the Key Peninsula area with Lake Kathryn Village being mentioned as a candidate location. To accommodate the expected increase in transit demand associated with the opening of the new Tacoma Narrows Bridge as a toll facility in 2007, it should be noted that Pierce Transit is planning to construct the new Peninsula Park-and-Ride facility in Gig Harbor on the west side of SR 16 across from the existing Kimball Drive Park-and-Ride lot.

Capital Facilities Policies

Goals

Require that facilities and services are provided prior to or concurrent with development. These services may include parks, recreation and open spaces, potable water supply, adequate sewage disposal, and stormwater and surface water management systems, fire protection, and transportation systems.

Residents of Key Peninsula have various needs to access Pierce County government offices ranging from applying for a building permit to attending a public hearing for a proposed subdivision. As the population of the community grows, the need for this access increases. Currently, Key Peninsula residents have to travel between 30 and 60 minutes to a County office in the City of Tacoma. Policy direction encourages Pierce County to make the County’s services more accessible.
PIERCE COUNTY OFFICES

GOAL KP CF-1 Improve access to Pierce County government services within the Key Peninsula community.

KP CF-1.1 Encourage Pierce County to locate offices west of the Tacoma Narrows to enable residents and business owners to attend County-related appointments and obtain permits without traveling to the City of Tacoma.

KP CF-1.2 Identify existing public or private facilities on the Key Peninsula or Gig Harbor Peninsula that could serve as a potential Pierce County satellite service center.

KP CF-1.3 Survey various segments of the Key Peninsula community to identify which services are desired in the community.

FIRE PROTECTION

GOAL KP CF-2 The residents of the Key Peninsula expect high quality, cost-effective fire protection services. The Pierce County Fire Protection Bureau (FPB) should work with the local fire district in achieving this goal.

KP CF-2.1 The FPB should recognize the differing needs and capabilities of the rural area in their regulations. Maintaining the rural character of the community should be a consideration in the decision-making process (e.g., large agriculture buildings are a part of the character of rural settings where water systems are not accessible).

KP CF-2.2 The FPB should consider providing services into the communities served. The FPB should provide staff resources at any Pierce County satellite office established on the Peninsula.

KP CF-2.3 The FPB should facilitate discussions between Fire District #16 and the local water purveyors regarding the maintenance and testing of water systems and fire hydrants that supply fire flow on the Key Peninsula.

KP CF-2.4 Pierce County shall work to establish a process between governmental agencies that foster better working relationship to save taxpayer monies.

KP CF-2.4.1 Pierce County should support the consolidation of services through fire authorities or other measures that create stronger and more cost-effective emergency services.

KP CF-2.4.2 Pierce County should solicit comments from Fire District #16 on all subdivision and discretionary land use permit applications that are proposed on the Key Peninsula.

KP CF-2.5 Pierce County shall support better working relationships with other counties to facilitate programs such as statewide emergency medical service protocols.
PARKS AND RECREATION POLICIES

GOALS

The Key Peninsula should have extensive parks, trails, open space, and recreational facilities for local residents and to promote tourism. The various park and recreational providers should collaborate in providing and maintaining these services.

REGIONAL PARKS

GOAL KP PR-1

Achieve and sustain an acceptable level of service for regional park facilities. Regional parks should provide both passive and active recreational amenities.

KP PR-1.4

The amount of land designated for regional parks shall be measurable. This level of service (LOS) for regional parks shall be a ratio based on the number of acres of park that are designated for every 1,000 people in Pierce County.

KP PR-1.4.1

Achieve and sustain an acceptable LOS for regional park facilities. Evaluate the LOS annually.

KP PR-1.4.2

Include park lands owned by other park providers such as the Washington State Parks and Key Peninsula Metropolitan Park Districts when measuring LOS.

KP PR-1.5

Improvement of shoreline parks and marine access locations are considered a higher priority than development of existing upland park facilities.

KP PR-1.6

Marine shoreline locations are the highest priority for regional park land acquisition within the Key Peninsula Community Plan area. Upland areas that could provide parking or access to public marine shorelines are considered high priority for acquisition.

TRAILS

GOAL KP PR-2

Develop a community-wide system of recreational trails. The system of trails should link neighborhoods with parks, school sites, and other public property. Public lands and existing rights-of-way should be used for trail purposes whenever feasible.

KP PR-2.4

The Pierce County Departments of Public Works and Utilities, Planning and Land Services, and Parks and Recreation should collaborate to create a map of unopened road right-of-way throughout the Key Peninsula.

KP PR-2.5

Prohibit the vacation of public right-of-way that provides pedestrian access or that could contribute toward a community-wide trail system.

KP PR-2.6

Beach trails along the saltwater shoreline are a high priority.
KP PR-2.7  Acquire property that will support a community-wide system of trails now and in the future. Whenever possible, unopened rights-of-way and other public lands should be dedicated for trail purposes. Acquiring easements across private lands should be considered when necessary.

KP PR-2.8  Pursue opportunities for property acquisition that provide shoreline access, trails for specific user groups, or that would contribute to a north-south community trail.

KP PR-2.9  Trail rights-of-way should be planned and constructed along existing corridors to minimize community disturbance. For example, railroad, utility line, and road rights-of-way should be followed when feasible.

KP PR-2.10 Private property owners are encouraged to donate public access and should be compensated when donating easements for the public across private property. Compensation could be in the form of outright purchase, PDR and TDR programs, in the form of tax credits, or development incentives. Trails on private property should follow property boundary lines whenever possible.

KP PR-2.11 Trails should be designed to accommodate the intensity and capacity of the anticipated use. Trails should be developed that separate incompatible user groups. Barrier-free trail segments are encouraged.

KP PR-2.12 The trail system on the Key Peninsula should eventually be linked with trail systems on the Gig Harbor Peninsula, in Kitsap and Mason counties, and the regional trail system on the east side of the Tacoma Narrows Bridge.

KP PR-2.13 Utilize open space areas, greenbelts in private developments, and public lands for trail purposes. Critical Area buffers may be used for impervious trails only when impacts to the Critical Area are properly mitigated.

KP PR-2.14 Partner with Tacoma Public Utilities to develop an east-west regional trail segment within the Tacoma-Cushman transmission corridor/144th Street KPN right-of-way.

KP PR-2.15 Signs that identify natural areas and wildlife habitat and encourage environmental awareness should be placed along trails in appropriate locations.

KP PR-2.16 Recreational trails should not be part of the paved roadway; however, recreational trails within a public right-of-way adjacent to a paved road are acceptable.

KP PR-2.17 Natural barriers such as wild rose should be utilized in situations that require an obstacle between a trail and private property where feasible.

KP PR-2.18 Trails should be designed to interconnect or form loops whenever possible. Trails should not dead-end unless unique circumstances exist such as a trail that provides access to a specific destination such as the marine shoreline.

KP PR-2.19 Identify segments of trails where a par course for exercise and recreation is warranted and feasible. Distance markers should be placed along the trail for walkers and runners.
KP PR-2.20 The Pierce County Parks and Recreation Department should facilitate an *adopt a park* and an *adopt a trail* program to encourage community support for these facilities.

KP PR-2.21 Pierce County and Key Peninsula Metro Parks should explore partnership opportunities with the private sector, Washington State Parks, and the Department of Natural Resources to develop informal trails and other beneficial uses at undeveloped sites such as Haley State Park and Maple Hollow.

**OPEN SPACE**

**GOAL KP PR-3** All open space providers should strive to acquire property that will contribute to a community-wide system of open space throughout the Key Peninsula.

KP PR-3.4 In a rapidly developing area like the Key Peninsula, it is important to acquire land for open space before properties become cost prohibitive.

KP PR-3.5 Public properties that are acquired for open space purposes should provide recreational trails when feasible.

KP PR-3.6 Take advantage of open space acquisition opportunities through the Pierce County Conservation Futures Program.

KP PR-3.7 Properties that are located within the adopted Open Space Corridors Map may be considered for public funding.

KP PR-3.8 Consider including properties that are less than 5 acres that provide a beneficial use such as access to marine shorelines.

KP PR-3.9 Allow the purchase of easements for public access across private property when fee-simple acquisition is not practical or possible.

KP PR-3.10 Consider purchasing development rights on properties that are large enough to be eligible for division and are zoned for Agriculture Resource Lands, Rural Farm, park and recreation, or Rural Sensitive Resource through the Conservation Futures program.

KP PR-3.11 Promote partnerships between organizations that provide open space including Pierce County, the Great Peninsula Conservancy land trust, the Key Peninsula Metro Park District, the Tahoma Audubon, and other local nonprofit organizations.

KP PR-3.12 Transfer publicly-owned open space to local land trusts or the Key Peninsula Metro Parks District as appropriate.

**RECREATION**

**GOAL KP PR-4** Encourage the development of indoor and outdoor recreation facilities for public use throughout the community at parks and at school sites. Recreational facility providers should retain natural features on these sites and provide habitat enhancement whenever possible.
KP PR-4.4  Additional active and passive recreational uses including sports fields, a community recreation center, equestrian facilities, a community garden, and trails are important to the community.

KP PR-4.5  Look for opportunities to develop public fishing piers at any of the marine parks.

KP PR-4.6  An indoor multi-use recreation center that includes facilities for teens is a priority.

KP PR-4.7  Additional recreational uses that should be considered at park locations include the uses described.

KP PR-4.8  Inventory public shoreline access points at County road ends.

KP PR-4.9  Prohibit the vacation or trading of unopened public rights-of-way at shoreline locations except when the vacation or trade would enable a public authority to acquire the vacated property for public purposes.

KP PR-4.10  Encourage the acquisition of land near County road ends at shoreline locations for parking and other public purposes. Mitigate impacts to adjacent property owners.

KP PR-4.11  Access and use of public beaches and state-owned tidelands in front of private waterfront properties is permitted. Mitigation of impacts to adjacent property owners at shoreline access points should be maintained (e.g., restrooms, trash receptacles, buffering, as appropriate). Signs that describe shoreline-related hazards and proper use of the beaches shall be installed and enforced.

KP PR-4.12  Public easements dedicating access to designated public waterfront areas should be included as a part of private upland development projects prior to site development of the private development.

KP PR-4.13  Shoreline parks and marine access locations should be developed utilizing low impact development techniques. Provide adequate facilities for the intended use at marine parks, and mitigate impacts to neighboring property owners.

KP PR-4.13.1  Boat launch length should be adequate to make the facility usable year-round at high and low tides. The site should be located in sheltered waters that have some protection from high winds if possible. Boat launch facilities should include a dock or pier to facilitate boat ingress and egress as appropriate for the location.

KP PR-4.13.2  Where feasible, provide support facilities such as restrooms, picnic shelters, picnic tables, and information signs. Proposed structures should maintain a low profile to avoid impacting views from adjacent properties.

KP PR-4.13.3  Parking facilities should be dependent on the size, location, and activities proposed.

KP PR-4.13.4  Identify improvements and maintenance activities needed to provide safe walking conditions for pedestrians to access the beach.

KP PR-4.13.5  Remove physical impediments to pedestrian access at shoreline locations.
KP PR-4.13.6 Mitigate impacts to adjoining private property when marine parks or shoreline access points are developed.

TRANSPORTATION POLICIES

GOALS

Provide transportation facilities and services that meet the needs of the community and that are appropriate for this rural area while preserving the natural characteristics of the land. Strive to develop a transportation system that accommodates growth, emphasizes safety, and promotes alternate means of travel.

ROADWAY IMPROVEMENTS

GOAL KP T-1 Pursue options for improving traffic flow and safety on the major thoroughfares that will benefit the Key Peninsula area. Develop a roadway system that accommodates existing and future traffic levels.

KP T-1.1 Give high priority to supporting the efforts of the Washington State Department of Transportation (WSDOT) in the funding and implementation of a new east-west transportation corridor within the Key Peninsula area.

KP T-1.1.1 Support the efforts of WSDOT to establish a new SR 302 corridor and to make improvements to the existing SR 302 corridor to adequately accommodate the future traffic needs of Key Peninsula and the regional highway corridor. Request that WSDOT investigate alternatives that utilize existing roadway and utility corridors to minimize impacts to existing and planned land uses and the environment. Request that WSDOT avoid alternatives in South Kitsap County that will significantly increase travel time and distance for Key Peninsula commuters traveling to and from SR 16 and the Gig Harbor Peninsula.

KP T-1.1.2 Continue to support WSDOT safety and operational improvements along the existing SR 302 alignment, including the intersections and the Purdy spit bridge. Request that WSDOT consider the addition of centerline rumble strips or buttons, roadside guide posts, raised reflective pavement markers, shoulders, guardrails, passing lanes or pullouts, center turn lanes, and turn lanes at intersections, where appropriate.

KP T-1.2 Support improvements outside of the Key Peninsula area that will provide improved access between Key Peninsula and Gig Harbor Peninsula. Support improvements that provide congestion relief and improve safety for commuters traveling between SR 16 and SR 302.

KP T-1.2.1 Request that WSDOT consider capacity and operational improvements on westbound SR 16, including the potential need for auxiliary lanes and off-ramp improvements leading to SR 302 from the Gig Harbor area.
KP T-1.2.2 Request that WSDOT consider capacity and operational improvements (signal adjustments, turn restrictions, etc.) to the SR 302/Purdy Drive intersection to relieve traffic congestion in the Wauna area.

KP T-1.3 Implement improvements to the north-south arterials that facilitate access to SR 302, any future realignment of SR 302, and Kitsap County.

KP T-1.3.1 Support improvements on Wright-Bliss Road KPN, 118th Avenue NW, and 94th Avenue NW. Consider the addition of turn lanes at the intersections of these arterials with SR 302.

KP T-1.3.2 Partner with Kitsap County in the planning, funding, and implementation of transportation improvements on the arterials that serve both counties.

KP T-1.4 Develop transportation facilities to accommodate planned growth, but not encourage or promote excessive growth. Avoid unnecessary duplication of roadways to save costs, minimize impervious cover, and preserve scenic atmosphere and open space.

KP T-1.4.1 Place primary emphasis in funding on the improvement of existing roadways rather than the construction of new roadways. Give priority to intersection improvements since they reduce congestion, improve safety, and are cost effective.

KP T-1.4.2 Give priority to new roadways which improve access or reduce congestion on existing roadways and to new roadways which facilitate access to local areas for emergency and service vehicles (fire trucks, school buses).

KP T-1.4.3 Consider traffic improvements that facilitate access to the proposed 360 regional park and fire department property.

KP T-1.4.4 Consider traffic improvements that facilitate access to current and proposed public facilities.

KP T-1.4.5 Require that any new public roads meet current Pierce County standards pursuant to the Pierce County Code. This requirement shall also apply to any private roads which are proposed to become a public road.

KP T-1.5 Coordinate with WSDOT concerning proposed improvements on SR 302. Seek consistency between the short-term and long-term transportation planning documents of WSDOT and the County.

KP T-1.6 Conduct or participate in community outreach efforts for the purpose of discussing local transportation issues and the study of related programs and projects.

KP T-1.7 Strive to maximize the safety and operational efficiency of the Key Peninsula roadway system.
KP T-1.7.1 Implement a program to investigate the feasibility of traffic calming measures and other innovative strategies to address speeding and pedestrian safety concerns on the Key Peninsula. Emphasis should be given to the Key Peninsula Highway near the rural commercial areas (Key Center and Home), Key Peninsula Middle School/sports complex (Volunteer Park) area, and other public facilities. These improvements should be consistent with the Key Peninsula Community Plan, County policies, state law, and the national standards as set forth in the Manual on Uniform Traffic Control Devices (MUTCD).

KP T-1.7.2 Work with the Sheriff’s Department to increase the enforcement of traffic laws. Work with WSDOT and civic groups to develop a strategy to educate motorists about traffic safety and speeding issues on the Key Peninsula.

KP T-1.7.3 Maximize the operating efficiency of arterials through the use of traffic signals (if warranted), center turn lanes, turn lanes, roundabouts, and other traffic flow improvements at appropriate locations.

KP T-1.7.4 Design any new or reconstructed intersections at right angles, wherever feasible. Discourage the use of offsets or sharp angle turns at intersections.

KP T-1.7.5 Encourage property owners to remove trees and other vegetation adjacent to driveways to improve driver visibility and sight distance.

KP T-1.7.6 Design any new or reconstructed arterials to meet current Pierce County standards. Strive to upgrade the existing major and secondary arterials within the Key Peninsula to current standards, if feasible. In addition to traffic volumes, consider other factors such as the condition and safety of the roadway when allocating funding for any upgrades to arterials.

KP T-1.7.7 Provide physical and visual separation between automobile traffic and pedestrians in the commercial areas through the use of curbing, raised walkways, changes in walkway surface treatment or material texture, and streetscaping.

KP T-1.7.8 Consult with the Peninsula School District to identify, prioritize, and implement safety-related improvements near schools and established bus stops. Improvements may include shoulders, sidewalks, crosswalks, street lighting, and traffic calming measures.

KP T-1.8 Provide a street lighting system consistent with safety requirements and the rural character of the Key Peninsula.

KP T-1.8.1 Consider providing street lighting in areas of safety concern, including major arterials, intersections, and locations with high accident rates.

KP T-1.8.2 Consider pedestrian and street lighting near commercial centers, schools, and other community facilities.
KP T-1.8.3 Gather public input in identifying candidate locations for street lighting within the framework of the applicable County street lighting policies.

KP T-1.9 Maximize the joint use of access roads and driveways by new development to improve traffic flow on SR 302, Key Peninsula Highway, and other arterials.

KP T-1.9.1 Consider changes to the County’s access regulations to encourage shared access driveways serving multiple properties. Ensure that shared access driveways are wide enough to accommodate simultaneous vehicular ingress and egress.

**NONMOTORIZED TRAVEL**

**GOAL KP T-2** Create a system of nonmotorized facilities to enhance pedestrian, bicycle, and equestrian travel throughout the Key Peninsula area.

KP T-2.1 Provide a continuous and interconnected network of nonmotorized facilities that link residential areas to community facilities, commercial centers, and other neighborhoods.

KP T-2.1.1 Work with the community to identify and pursue nonmotorized improvements leading to schools, libraries, parks, playfields, bus stops, shopping areas, and neighborhoods.

KP T-2.1.2 Accommodate nonmotorized travel by providing continuous paved shoulders along SR 302 and Key Peninsula Highway.

KP T-2.1.3 Provide nonmotorized connections to ferry docks, boat launches, public docks and piers, beaches, wildlife viewing areas, and other shoreline uses.

KP T-2.1.4 Accommodate equestrian use on routes that lead to public stables, trailheads, and other equestrian activity centers when the equestrian use does not limit other transportation modes.

KP T-2.1.5 Consider the use of gravel paths for horse riders adjacent to the shoulder, where appropriate.

KP T-2.2 Consider the use of wider paved shoulders (more than six feet) on SR 302 and Key Peninsula Highway, wherever feasible, to achieve increased safety for pedestrians, bicyclists, and equestrians and to provide sufficient room for temporary or emergency parking.

KP T-2.3 Enhance safe pedestrian, bicycle, and equestrian travel through the provision of paths which are physically separated from the roadway, wherever feasible.

KP T-2.4 Separate pedestrian facilities from roadways with planting strips or other enhancements in high use areas such as schools, commercial centers, and recreation areas.

KP T-2.5 Consider the provision of paths or shoulders on local roads since they may serve heavier pedestrian and bicycle use than arterials.
KP T-2.6 Consider the placement of signs to advise bicyclists to use Creviston Drive NW and Cramer Road NW as an alternative to SR 302 and Key Peninsula Highway.

KP T-2.7 Encourage new businesses to provide pedestrian connections to adjacent businesses to encourage walking between businesses.

KP T-2.8 Explore funding options (e.g., tax incentives, land use credits) to encourage property owners to create or extend nonmotorized facilities, including paths and trails.

KP T-2.9 Request that WSDOT consider the provision of a regional trail as part of future improvements to the SR 302 corridor.

KP T-2.10 Work with Kitsap County and Mason County to provide continuous pedestrian, bicycle, and trail connections between these jurisdictions.

KP T-2.11 Work with the Tacoma Utilities Department and other affected property owners to determine the most desirable use or combination of uses (local road, bike path, horse trail, etc.) along 144th Street KPN/NW (Powerline Road) and the Tacoma-Lake Cushman power transmission lines.

KP T-2.12 Work with utility providers to explore opportunities to locate paths and trails along areas where utility lines will be underground.

KP T-2.13 Conduct or participate in community outreach efforts to gather input on local nonmotorized needs and concerns.

**ROADWAY AESTHETICS**

**GOAL KP T-3** Preserve the rural character of the Key Peninsula roadway system.

KP T-3.1 Maintain the existing rural character of the roadways through residential neighborhoods and commercial centers.

KP T-3.1.1 Limit widening on the collector arterials and local roads to upgrading the roadway to meet design standards or to provide shoulders, turn lanes, or nonmotorized improvements.

KP T-3.1.2 Consider the use of paved shoulders instead of sidewalks outside of rural commercial areas to preserve the rural character of the community.

KP T-3.1.3 Work with local groups to explore opportunities for funding alternatives (e.g., grants, local improvement districts, tax incentives) for pedestrian facilities in the rural commercial centers.

KP T-3.1.4 Explore the possibility of developing different styles and widths of pedestrian facilities (e.g., bulb-outs or curb extensions) that would be unique to the rural commercial centers on the Key Peninsula.
KP T-3.2  Maintain the visual corridors along the highways and major roadways on the Key Peninsula through the retention of trees, greenery, and native vegetation on adjacent properties.

KP T-3.2.1  Include streetscaping between any new pedestrian facilities and the roadway, where feasible. If possible, any streetscaping should consist of drought-resistant or native vegetation.

KP T-3.2.2  Enhance roadway aesthetics through the commercial centers through the use of adjoining greenbelts and boulevard concepts.

KP T-3.2.3  Provide pedestrian facilities at bridge locations to enhance viewing opportunities. Consider the use of bulb-outs or curb extensions at new bridges or bridge upgrades to create character and to slow traffic speeds.

KP T-3.3  Plan and locate roadways to preserve neighborhoods and natural resources by avoiding bisection of these areas.

KP T-3.4  Develop a pilot program on the Key Peninsula to authorize the installation of off-site tourist-oriented directional signs within the County road right-of-way.

KP T-3.5  Require that the replacement or expansion of existing overhead utilities adjacent to the roadways be underground.

**TRANSPORT SERVICE**

**GOAL KP T-4**  Promote the continued development of the transit system to serve the internal and external travel needs of Key Peninsula residents.

KP T-4.1.1  Promote increased transit service for commuters traveling within and outside of the Key Peninsula area. Provide a range of transit services that is cost effective and reliable.

KP T-4.1.2  Request that transit agencies provide more frequent bus service (i.e., hourly service) within the Key Peninsula area as demand warrants.

KP T-4.1.3  Work with transit agencies to expand express services to the Purdy park-and-ride lot. Coordinate these services with services operating on the Key Peninsula.

KP T-4.1.4  Work with transit agencies to establish commuter services that link population centers and park-and-ride facilities on the Key Peninsula with the network of regional express services.

KP T-4.1.5  Work with transit agencies to determine the feasibility of providing service to areas on the Key Peninsula that are not currently served by transit. Request that transit agencies consider the extension of bus service to the Longbranch area.
KP T-4.1.6 Support efforts by transit agencies to develop stops along future primary bus service routes, including SR-302 (Elgin-Clifton Road KPN), Key Peninsula Highway, Wright-Bliss Road KPN, Lackey Road KPN, Creviston Drive NW, Cramer Road KPN, and Whiteman Road KPS.

KP T-4.1.7 Provide bus stops at the rural commercial centers and community facilities within the Key Peninsula area.

KP T-4.1.8 Ensure that potential bus stops are considered as part of future roadway improvement projects. Consider the provision of adequate right-of-way to accommodate the placement of accessible bus stops.

KP T-4.1.9 Work with transit agencies to provide improved marketing and promotion of the full range of transit services available to Key Peninsula residents, including bus service, vanpooling, and rideshare services.

KP T-4.1.10 Encourage transit agencies to expand the network of vanpool services that operate on the Key Peninsula.

KP T-4.2 Provide transportation improvements that facilitate bus travel and pedestrian access to bus stops.

KP T-4.2.1 Work with transit agencies to identify locations where improvements are needed to improve bus travel. Consider such improvements as part of future roadway improvement projects.

KP T-4.2.2 Facilitate pedestrian access to bus stops through the provision of shoulder improvements, which can also serve as passenger waiting areas.

KP T-4.2.3 Locate bus stops at convenient locations where buses can pull off the roadway. Avoid the placement of bus stops near busy intersections, whenever possible.

KP T-4.3 Support the expansion of existing park-and-ride lots that serve Key Peninsula commuters and the development of new park-and-ride lots in the Key Peninsula area.

KP T-4.3.1 Support the expansion of the Purdy park-and-ride lot and any related expansion of local and regional bus service at that location.

KP T-4.3.2 Work with transit agencies to obtain park-and-ride lots through leasing or purchasing of state and private properties. Consider the feasibility of developing a park-and-ride lot along SR-302 (e.g., Lake Kathryn Village shopping center) to serve residents in the northern part of the Key Peninsula area.
KP T-4.3.3  Encourage transit agencies to establish new park-and-ride facilities, together with appropriate pedestrian and safety amenities, in other parts of the Key Peninsula as needs develop.

**UTILITIES POLICIES**

**DOMESTIC WATER**

**GOAL KP U-1**  Development on the Key Peninsula shall utilize groundwater at sustainable rates. Growth and development should not be permitted that would negatively impact the long-term availability of clean, fresh water that is necessary for the high quality of life that local residents enjoy.

- **KP U-1.1**  Support efforts to establish a water budget for the Key Peninsula as well as efforts to identify aquifer recharge areas throughout the Peninsula.
- **KP U-1.2**  Review water system plans to ensure that they are compatible with the Key Peninsula Community Plan.
- **KP U-1.3**  Explore the feasibility of a regional water supply system.
- **KP U-1.3.1**  Encourage the regional management of small water systems on the Peninsula.
- **KP U-1.3.2**  Encourage the physical inter-tying of small water systems whenever possible.
- **KP U-1.4**  Promote educational programs that provide information to property owners concerning wellhead protection measures.
- **KP U-1.5**  Encourage land uses and programs that promote aquifer recharge within the plan area such as projects utilizing low impact development techniques.

**GOAL KP U-2**  Encourage water conservation measures for all land uses.

- **KP U-2.1**  Encourage water purveyors and homeowners to trace and repair water leaks in existing water systems.
- **KP U-2.2**  Encourage the application and implementation of water-conserving landscaping plans. Promote the retention of existing vegetation and the use of drought-tolerant native vegetation in landscaping areas.
- **KP U-2.3**  Promote the development of cost-sharing programs to help people purchase low-flow fixtures (e.g., appliances, faucets, and toilets) for their existing homes.
- **KP U-2.4**  Prohibit new wells on sites that are at high risk for saltwater intrusion, unless it can be demonstrated through a hydrogeologic assessment that additional groundwater withdrawal will not worsen the problem in the vicinity.
- **KP U-2.5**  Pierce County shall implement adaptive management strategies based upon the information received from groundwater monitoring programs.
**KP U-2.5.1** Support long-term groundwater quantity and quality monitoring programs in areas that provide domestic water supplies.

**KP U-2.5.2** Pursue funding opportunities to determine the hydrologic budget for the plan area and identify potential trends.

**KP U-2.5.3** Consider the results of a water availability analysis when making future long range planning decisions within the plan area.

### Septic Systems and Wastewater

**GOAL KP U-3** Septic systems provide wastewater disposal for land uses on the Key Peninsula. Current technology allows properly installed modern septic systems to clean wastewater and recharge local aquifers. Special care shall be taken when designing and installing septic systems near the marine shorelines, lakes, streams, or other sensitive environmental features. Existing systems must be properly maintained and failing systems must be repaired or replaced.

**KP U-3.1** Pierce County does not provide sanitary sewer or wastewater treatment on the Key Peninsula. Septic systems provide the only means of wastewater disposal for all land use types in the rural area. Individual on-site septic systems are typically utilized; however, a variety of community systems may be used under certain circumstances. Septic systems shall be designed using the newest technology and should be maintained regularly to properly function.

**KP U-3.2** Existing septic systems near marine shorelines and freshwater streams, lakes, and wetlands should be monitored closely. Encourage property owners to participate in the Tacoma Pierce County Health Department monitoring program.

**KP U-3.3** Encourage the use of low-flow plumbing fixtures and appliances to reduce the possible exacerbation of slope failures near marine bluffs by oversaturating on-site system drainfields.

**KP U-3.4** Sanitary sewer service shall not be permitted in the rural area except under limited circumstances.

**KP U-3.5** Land uses within rural commercial centers that cannot be sustained by rural facilities such as on-site or community septic systems shall not be permitted.

### Solid Waste

**GOAL KP U-4** The residents and businesses on the Key Peninsula shall have cost-effective and environmentally-sustainable waste disposal and recycling services.

**KP U-4.1** Ensure that the community is provided with an environmentally sound, economically responsible means of solid waste management that balances the need for this service with the costs of waste disposal.
KP U-4.2 Ensure that all residents of the Key Peninsula have access to refuse disposal and recycling collection services.

KP U-4.3 Encourage product stewardship practices that facilitate recycling of consumer products that are difficult to recycle as described in the Washington State electronic product recycling program.

KP U-4.4 Encourage recycling at agriculture operations and home occupation locations.

KP U-4.5 Encourage the development of a program that promotes the recycling of glass products.

KP U-4.6 Provide opportunities for recycling at transfer locations for the public and commercial haulers.

KP U-4.7 Expand the number and capacity of drop-off recycling facilities.

KP U-4.8 Encourage private businesses to participate in buy-back recycling programs.

KP U-4.9 Encourage waste collection companies serving the Peninsula to create a cost-effective commingled recycling option for civic uses and small business owners similar to the residential single cart recycling program.

KP U-4.10 Design and locate solid waste disposal facilities with proper consideration for present and future health and environmental impacts, while recognizing the need to provide these facilities within the community.

KP U-4.10.1 Minimize visual and noise impacts of trash and recycling collection points, loading docks, waste facilities, outdoor storage areas, and other service areas through site design, landscaping, and screening.

KP U-4.11 Study the value of utilizing mandatory collection to reduce incentives for litter and illegal dumping and to help pay for things such as special collection programs, household hazardous waste collection, and community cleanups.

KP U-4.12 Only those waste processing technologies that are protective of human health and the environment (e.g., no adverse odor impacts to neighboring properties) shall be permitted.

KP U-4.13 Encourage businesses to accept the return of problem waste (e.g., oil, batteries, computer monitors, cell phones, etc.) from products they sell, for proper disposal.

KP U-4.14 Encourage the Key Center drop box transfer station to accept oil, antifreeze, and other household hazardous waste, or for the County to sponsor regular collection events.

KP U-4.15 Work with the local newspaper to regularly promote the location of and the proper use of the free recycling drop-off sites that are located throughout the community.
GOAL KP U-5  Reliable, cost-effective electrical services should be provided throughout the Key Peninsula. Alternative energy sources should be explored and accommodated when they are cost effective and environmentally sustainable.

KP U-5.1  Encourage regional electrical providers to keep their rights-of-way clear to preserve opportunities for future alternative power systems.

KP U-5.2  Support Peninsula Light Company’s policy of undergrounding utility lines and installing smart meter reader systems.

KP U-5.3  Encourage the installation of utility lines to connect non-utility-owned electric generation sites to the power grid.

KP U-5.4  Provide appropriate locations for alternative energy sources.

KP U-5.5  Promote the use of new technologies such as fuel cells in residential structures to supply power to individual homes.

IMPLEMENTING ACTIONS

The following list of actions need to be completed in order to implement the policies contained within this plan. They are arranged according to the timeframe within which each should be completed: short, medium, or long term. Short-term actions should occur within one year of plan adoption. Mid-term actions should be completed within 1-5 years. Long-term actions should be completed within 5-10 years of plan adoption. The entity or entities responsible for leading the effort to complete the action item is listed in parenthesis following the action. Actions are assigned to the Land Use Advisory Commission (LUAC), Pierce County Planning and Land Services (PALS), Pierce County Economic Development (ED), Pierce County Parks and Recreation (Parks), Pierce County Public Works & Utilities (PWU), Tacoma-Pierce County Health Department (TPCHD), Pierce County Assessor, Pierce Conservation District (PCD), Key Peninsula Community Councils, and the Key Peninsula Business Association.

SHORT TERM ACTIONS (UPON PLAN ADOPTION TO 1 YEAR)

1. Support Peninsula Light Company’s policy of undergrounding utility lines and installing smart meter reader systems. (PALS, PWU)
2. Coordinate the review and approval of septic permits with the Planning and Land Services Department in order to determine if critical areas exist on the subject property. (PALS, PWU)
3. Amend Title 18A – Development Regulations – Zoning to minimize visual and noise impacts of trash and recycling collection points, loading docks, waste facilities, outdoor storage areas, and other service areas through site design, landscaping, and screening. (PALS)
Domestic Water

4. Require water system plans prepared by individual public water utilities to demonstrate that water resource management planning has been coordinated with adjacent Group A purveyors. (PWU)
5. Encourage the application and implementation of water conserving landscaping plans. Promote the retention of existing vegetation and the use of drought tolerant native vegetation in landscaping areas. (PALS)
6. Prohibit new wells on sites that are at high risk for saltwater intrusion, unless it can be demonstrated through a hydrogeologic assessment that additional groundwater withdrawal will not worsen the problem in the vicinity. (PALS, PWU, TPCHD)

Law Enforcement and Fire Protection

7. Establish a process for local fire district review and comment on development proposals. (PALS, FPB, Fire District 16)

Solid Waste

8. Provide for adequate waste disposal capacity on the Key Peninsula considering emergency needs as well as planned regular disposal needs. (PWU)
9. Ensure that all residents of the Key Peninsula have access to refuse disposal and recycling collection services. (PWU)

Transportation

10. Consider amending the annual updates to the Six-Year Transportation Improvement Program (TIP) and the Capital Facilities Plan (CFP) to include the highest priority motorized and nonmotorized transportation projects in the Key Peninsula Community Plan. (PWU, PALS)
11. Participate in the preparation of upcoming studies by the Washington State Department of Transportation (WSDOT) to establish a new SR 302 corridor or to make improvements to the existing SR 302 corridor. Request that WSDOT consider the provision of a regional trail as part of future improvements to the SR 302 corridor. (PWU, Parks)
12. Coordinate with WSDOT to request safety and operational improvements to the existing SR 302 corridor, including the SR 302/Purdy Drive NW intersection and the SR 16 ramps leading to SR 302. (PWU)
13. Develop and implement the Countywide traffic impact fee program as a means of financing roadway capacity improvements and mitigating the cumulative traffic impacts associated with future development. (PWU)
14. Amend development regulations to encourage the joint use of access roads and driveways by new development along SR 302, Key Peninsula Highway, and other arterials. (PALS, PWU)
15. Amend development regulations and roadway design standards to encourage the provision of nonmotorized facilities in new developments and in all new roadway construction. (PALS, PWU)
16. Coordinate with the Peninsula School District and the Key Peninsula Metropolitan Park District to identify and prioritize pedestrian and bicycle improvements for upcoming grant funding applications. (PWU, Parks)

17. Develop regulations to permit the installation of community-oriented signage along the roadways on the Key Peninsula. (PALS, PWU)

**Mid-Term Actions (1-5 years)**

1. Pierce County should study the feasibility of locating satellite government offices west of the Tacoma Narrows. (PALS, PWU, ED)

2. Introduce a variety of strategies that encourage public and private organizations to acquire, retain, and preserve open space. (PALS, Parks, LUAC, Key Peninsula Community Councils)

3. Develop and promote the Purchase of Development Rights and Transfer of Development Rights programs. (PALS, ED, Parks)

**Domestic Water**

4. Initiate water conservation measures. (PWU – Sewer and Water Utility Division and local water purveyors)

5. Support efforts to establish a water budget for the Key Peninsula as well as efforts to identify aquifer recharge areas throughout the Peninsula. (PWU, TPCHD, PALS)

6. Amend the Letter of Water Availability form to require additional information about water rights and existing and available water capacity to serve new development. (TPCHD, PALS)

7. Review existing and updated water system plans to ensure that they are compatible with the Key Peninsula Community Land Use Plan. (PALS)

**Solid Waste**

8. Provide opportunities for recycling at transfer locations for the public and commercial haulers. Expand the number and capacity of drop-off recycling facilities. (PWU)

9. Encourage private businesses to participate in buy-back recycling programs. (PWU)

10. Encourage waste collection companies serving the Peninsula to create a cost-effective commingled recycling option for civic uses and small business owners similar to the residential single cart recycling program. (PWU)

11. Encourage the Pierce County Solid Waste Division, the Tacoma-Pierce County Health Department, and the Pierce Conservation District to develop systems for the recovery and composting of animal manure. (PWU)

12. Encourage problem waste disposal facilities at the Key Center drop box transfer station and other appropriate public locations which currently lack these facilities. (PWU)

**Parks**

13. Actively pursue public access to marine and public fresh waters to provide shoreline access to non-waterfront neighborhoods. (PALS, PWU, Parks)
14. Work with Key Peninsula Metro Parks and the Washington State Department of Natural Resources to transfer surplus DNR lands to Metro Parks. (PALS, Parks)
15. Work with Key Peninsula Metro Parks to finalize the 360 acre park Master Development Site Plan and implement the plan through approval by the County Hearing Examiner. (Parks, PALS)
16. Pursue partnership opportunities for the acquisition of regional, neighborhood, and community park sites. (Parks)
17. Provide technical assistance to the Key Peninsula Metro Parks in the preparation of grants for park property acquisition, operation, and maintenance. (Parks)
18. Plan for a community-wide system of public trails to complement the nonmotorized transportation system. (Parks)
19. Establish a park impact fee, land dedication, or fee-in-lieu-of dedication program for community and neighborhood level parks within the plan area. (PALS, Parks)
20. Amend the Pierce County Development Regulations to require the dedication of regional trails or a fee-in-lieu-of land dedication during the site development process and to require the installation of nonmotorized transportation trails that connect new developments to schools, parks, or adjacent developments. (PALS, Parks)

**Transportation**

21. Consider amending the Pierce County Transportation Plan (Element) to include the motorized and nonmotorized transportation projects and priorities in the Key Peninsula Community Plan. (PWU)
22. Coordinate with WSDOT to ensure that improvements to SR 302 in the Key Peninsula area are included in the updates to the Highway System Plan (HSP) and other WSDOT planning and programming documents. (PALS, PWU)
23. Implement a program to investigate the feasibility of traffic calming measures and other strategies to address vehicle speeding and pedestrian safety concerns on the Key Peninsula. This program should include the participation of WSDOT, Peninsula School District, and local civic groups. (PWU, Sheriff)
24. Coordinate with WSDOT, the Key Peninsula Metro Park District, and other local groups to identify and implement an interconnected system of nonmotorized improvements throughout the Key Peninsula area. (Parks, PALS, PWU)
25. Work with the City of Tacoma, the Key Peninsula Metro Park District, and other affected property owners to study the feasibility of developing a regional multi-use trail along 144th Street KPN/NW (Powerline Road) and the Tacoma-Lake Cushman power transmission lines. (Parks, PALS, PWU)
26. Coordinate with Pierce Transit to increase the frequency and number of bus stops for the Bus PLUS service in Key Peninsula. Emphasis should be given to providing more frequent connections to the express bus service at the Purdy Park-and-Ride lot. (PALS, PWU)
27. Work with Pierce Transit to increase the number of Park-and-Ride lots in the Key Peninsula area. Consideration should be given to Lake Kathryn Village as a potential site for a Park-and-Ride lot. (PALS, PWU)
**LONG TERM ACTIONS (5-10 YEARS)**

**Domestic Water**
1. Coordinate land use planning and watershed planning efforts in Pierce County. Utilize the watershed plan information in future updates to the community plan. (PALS, PWU, TPCHD)

**Parks**
2. Acquire additional parcels of land for future park and trail development. (Parks)
3. Develop a system of recreational trails for local residents and tourists. (Parks)

**Transportation**
4. Coordinate with Pierce Transit to expand the service area for the Bus PLUS service in Key Peninsula. Consideration should be given to extending Bus PLUS service to Longbranch. (PALS, PWU)
Chapter 7: Plan Monitoring

The 1990 State Growth Management Act (GMA) requires jurisdictions to report on progress made in implementing the Act, and to subject their comprehensive plans to continuing evaluation and review. As a component of the County’s Comprehensive Plan, the Key Peninsula Community Plan is subject to this requirement. Generally, community plans are updated every five years and monitored yearly. The monitoring process includes evaluating the development standards, regulations, actions, and other programs called for in the plan for the purpose of determining their effectiveness in fulfilling the vision of each of the five elements of the plan.

Monitoring actions steps includes the development and implementation of regulations and design standards, coordinating the provision of facilities and services, developing educational programs and handouts, acquiring parks, preserving open space, and other actions. Information obtained from the monitoring program can be used to offer recommendations to decision makers as to what changes to the community plan may be needed in order to attain specified goals and meet the visions in the plan.
Appendix H: Mid-County Community Plan

The Mid-County Community Plan’s narrative text and policies are in addition to the Countywide Comprehensive Plan narrative text and policies and are only applicable within the Mid-County Community Plan Boundary.

- “Current” or “Existing” conditions are in reference to conditions at time of adoption (Adopted Ord. 2005-94s2, Effective 3/1/2006).
- “Proposed” or “Desired” conditions are those which required Council action and may have also been amended over time through a Comprehensive Plan Amendment (amendments are reflected in this document).

Chapter 1: Introduction

General Description of the Plan Area

Central Pierce County has experienced a significant amount of growth during the past several decades. Some of this growth has been at the expense of the Mid-County area’s rural atmosphere.

The Mid-County Community Plan area is located in central Pierce County at the fringe of the County’s urban growth area limits. The plan area is bordered by the City of Tacoma and the communities of Midland and Parkland to the west, the City of Puyallup and South Hill to the east, the City of Fife to the north and Frederickson to the south. The northern boundary of the plan area is State Route 167 (River Road) and Brookdale Road East/160th Street East represents the southern boundary. The western boundary shifts between the City of Tacoma boundaries, 20th Avenue East, and Golden Given. Woodland Avenue and 66th Avenue East represent the eastern boundary. The intersection of 96th Street East and Canyon Road East is roughly the geographic center of the plan area.

The plan area is approximately 23 square miles in size and encompasses almost 14,652 acres of urban, rural, and natural resource lands. Many small, distinct communities are located within the plan area including Summit-Waller, North Clover Creek Collins, and Summit View. Some plan area residents associate themselves with other neighboring communities such as Midland and South Hill. Major north/south transportation routes within and adjacent to the plan area include Mountain Highway, State Route 161 (Meridian), and Canyon Road East which bisects the center of the plan area. The main east/west access routes through the plan area are SR 167, 72nd Street East, SR 512, and 112th Street East.

While a small portion of the eastern plan area is located within the County’s Urban Growth Area boundaries, the majority of the plan area is rural in character with agricultural activities, hobby farms, and low density rural residential housing. There are many unique environmental features within the plan area including a system of rivers and creeks, all of which support a variety of wildlife species.
GROWTH TRENDS, POPULATION AND DEMOGRAPHICS

GROWTH TRENDS

During the years between 1990 and 2000, the Mid-County plan area had a similar percentage of population growth compared to Pierce County as a whole, but less growth compared to surrounding communities. The following is an example of the comparative growth (expressed in percent) from 1990 to 2000 between the plan area and other areas:

- Mid County - 18%
- Pierce County (incorporated and unincorporated) - 20%
- South Hill - 44%
- Frederickson - 52%
- Graham - 58%

CURRENT POPULATION

The year 2000 population within the plan area was estimated at 23,117 people. Of the total plan area population, it is estimated that 4,269 of those people reside inside the Comprehensive Urban Growth Area (CUGA) boundary while the remaining 18,848 residents live in either designated rural or natural resource areas. The year 2022 population estimates indicate that the population is expected to increase to 25,639 people. From this total estimate, 5,840 of those people will reside inside the CUGA boundary while the remaining 19,799 residents will live in either designated rural or resource areas.

DEMOGRAPHICS

Demographics for the plan area were compiled from information contained within the year 2000 U.S Census survey. The following census block groups contain the plan area and were used to derive the demographic information: 710.001, 710.002, 710.003, 710.004, 710.005, 710.006, 711.001, 711.002, 712.051, 712.052, 712.062, 712.063, 713.051, 713.052, 713.061, 713.062, 713.063, 713.073, 713.081, and 713.082.

The population within the plan area is generally older than Pierce County’s average. The median age for this plan area is approximately 38, while that for the County as a whole is approximately 35. The median household size for the plan area closely reflects that of the County, being 2.5 members in Mid-County and 2.62 in the County as a whole.

HISTORY OF MID-COUNTY

EARLY HISTORY

Native Americans lived in the Mid-County area for thousands of years before Europeans started to arrive in the 1830s. The local tribe which inhabited and utilized the Puyallup River area was the Puyallup Tribe of Indians, who hold reservation lands in this area today. Tribal villages were
established throughout the Puyallup River watershed and beyond. Hunting, fishing and gathering were their traditional food provision methods.

The Puyallup River valley area was one of the first areas in Pierce County settled by Euro-American emigrants who came west through an overland route such as the Oregon Trail in the 1850s. In 1853, the Mid-County area became part of the Washington Territory, and in 1889, part of the newly-formed State of Washington.

In 1850, the U.S. Congress passed the Donation Land Act that granted 320 acres to single adult male citizens or 640 acres to married couples settling the area. Portions of E. Meeker and C. Downey Donation Land Claims granted under this Act are located in the Mid-County community planning area.

Some of the segments in the present day arterials in the Mid-County community were dedicated to the local government for use as roads by local property owners and were named after the persons dedicating them or well-known families in the area. Some of these road names go back to the latter part of the nineteenth century. The following past road names are examples:

- S. Wilkens Road (a segment of 72nd Street East)
- Moeller-Mahon Road (a segment of 96th Street East)
- Knapp Moore Road (a segment of 104th Street East)
- Geo. A. Cooper Road (a segment of 128th Street East)
- Widerhold-Headley Road (a segment of Brookdale Road)
- Jordan-Chesney Road (a segment of Waller Road)
- Malcom McLarty Road (a segment of Canyon Road)
- Tacoma-Puyallup Road (Pioneer Way)
- Collins Road (a segment of 128th Street East)
- Moeller-Mahon Road (a segment of Vickery Avenue)
- Byrd’s Mill-Puyallup Road Revision (a segment of 84th Street East)
- Wilt-Hegele Road Extension (a segment of 112th Street East)
- Central Road (Bingham Avenue)

**Development of the Community**

Early settlers from the latter part of the nineteenth century were engaged in logging and agriculture, and fished in local waters. Crops cultivated in area farms included hops (in early period), and later, berries, bulbs, vegetables, hay, and grain, such as barley and oats. Later, raising cattle, dairy cows, goats, sheep and chickens became more common on local farms. Railroad lines that passed through the Summit area in the last decades of nineteenth century helped transport logs and farm produce from the area and bring supplies to the area.

**Schools**

Schools were a source of pride for the early Mid-County community. The Midland School District was formed in 1880. Its first two-story school was built in the 1890s. In 1904, the
Harvard School District consolidated with Midland School to become Midland School District No. 304.

Summit School, serving grades 1 through 4, was built in 1908 as a one-room school. In 1911, a second room was added to the Summit School and it was renamed the Central Avenue School. In 1927, after a fire destroyed the building in 1925, a much larger brick building was built to house only the elementary school children at 4505 104th Street East. Additions to the Central Avenue School were built in the 1940s and 1955. The Central Avenue School building still exists today at the same location.

Collins School, originally built in 1908 as a one-room school, added a second room in 1910 and a third room in 1919.

The Franklin Pierce School District No. 402 was created by voter approval in 1947, consolidating the Midland, Collins, and Central Avenue schools, in addition to the Parkland school.

In the early 1910s the local community organized another new School District No. 123. The one-room Woodrow School, named after President Woodrow Wilson, was constructed mostly through local community donation of labor and materials. It was expanded to a two-room school in 1918. A special school levy was passed to fund the construction of a modern building in the middle of the 1930s. A new three-classroom brick building was completed around 1936. At this time, Woodrow School was renamed Waller Road School. In 1953, three more classrooms were added. Further additions were made, including three classrooms and a play court on the north end of the building, seven classrooms, an office area and a multi-purpose room on the south end of the building added in 1960. In 1985, additional remodeling was accomplished to modernize the facility.

A large shed on property owned by Ed Eichorn served as a temporary school building while the first one-room Woodrow School building was being constructed in 1913. Later, when the Eichorn property was sold, the shed which served as a temporary school building was moved to the Waller Road Grange. The Waller Road Grange decided to renovate it as a special Pierce County bicentennial project. A group of volunteers furnished the building with authentic historic furnishings from the 1910s. During the local grange-related festivities, the first school building serves as a museum and community historic resource and is open to the public.

Agriculture, Infrastructure and Commerce

Collins and Waller Granges were two early granges organized in the community in the 1920s. They were organized to promote the area farmers' interest as a political entity and to provide educational and social opportunities for the local community. The granges still operate and remain two of the oldest granges in Pierce County.

Businesses established in the early decades of the twentieth century included Kimberg’s feed and grain store (which later added a gas pump), Sundell’s barbershop, confectionary store and pool hall, and Billy Bent’s Woodland Grocery. Kimberg’s store became Summit Trading Company in 1919 when purchased by Elmer and Oscar Carlson and moved to its present location at 10409 Canyon Road East in 1930. The store is still in family ownership.
Large dairy farms, poultry processing plants, and natural resource-based operations have located in the Mid-County area at different times. Faith Dairy operated a dairy farm in the 1960s and 1970s. Pederson Farm processed poultry starting in the 1940s and continued into the 1990s. Fors (Chicken) Hatchery also operated for a few decades. Gravel mining and construction-related industries such as Tucci’s and Sawyer’s gravel pit operated for many years. Some of these establishments have evolved to adjust to the changing markets and economic circumstances over time.

In 1925, a private water utility company was organized and shares were sold to individuals and businesses. The company brought domestic potable water to individual properties through wooden pipes. Starting in the late 1910s, telephone service became available to the area. By the mid-1920s, approximately 15 families around Waller Road had telephone service. Puget Sound Interurban Electric Railway which ran between Tacoma and Seattle reached the Puyallup area in December 1908 through the new “Short Line” that connected Tacoma with Puyallup. The line went south past the Puyallup fairgrounds, then west up the hill, through Summit, Midland, and Woodland (along present-day 104th Street East). Then it connected with the Spanaway line at Parkland. The electric railway stopped operating in 1928 because of decreased demand as more roads were paved for travel by automobile.

In 1926, Waller Road was paved in concrete making it more convenient for automobile travel. In 1928, Puget Power brought electricity to the Mid-County area. In 1930, the first Waller Road bus line was started by Charles Reed. The bus service took people from the community to Tacoma. The line later expanded to include service to Summit and Vickery. The demand for bus service declined as more people drove their own automobiles, and caused the local bus service to stop operating for a while. In 1947, the private bus service resumed.

Pierce County Fire District No. 9 (Woodland-Collins) was formed in April 1948, by the Summit-Woodland-Collins area residents. Through a special levy passed by area voters, the Fire District purchased a fire truck and equipment and housed them in a temporary structure. The first fire station was built at 11325 Canyon Road in 1950. Soon thereafter, Fire District No. 9 expanded from one station to three, from ten volunteers to forty volunteers, from one fire truck to twelve, adding ten paid personnel, and extending the fire protection coverage to thirty eight square mile area by late 1970s. In the early 1990s District 9 merged with District 4 (Midland), District 6 (Parkland), and District 7 (Spanaway) to form Central Pierce Fire and Rescue (CPFR). CPFR is now the County’s largest fire district.

**Growth and Development in the Late Twentieth Century**

The farms, orchards, and ranches of earlier decades gradually declined and became less active as family-owned and -operated industries and businesses. By the 1960s and continuing in the 1970s, the Mid-County area was becoming increasingly divided into smaller residential parcels of land.

Many existing Mid-County property owners enjoy the area’s agricultural heritage and rural lifestyle. A number of property owners operate ranches and other agricultural enterprises on a
hobby basis and support the protection of the rural heritage, rural lifestyle, and land use pattern.

The 40-acre land surrounding the Swan Creek was established as a regional-level Pierce County park land in 1967. In 1994, 160 acres of open space was established as Orangegate Park, a regional-level Pierce County park. Protection and conservation of major water and land resources such as Swan, Squally, and Clear Creeks and the Orangegate Park has become an important community-wide issue in recent decades.

**Planning History**

**County Planning**

**1962 Pierce County Comprehensive Plan and Zoning**

The first Pierce County Comprehensive Land Use Plan and the Pierce County Zoning Code were adopted in 1962. Zoning districts were established that dictated the appropriate location for commercial business and residential homes. However, the Plan did not offer much protection from incompatible uses and did not recognize the unique individuality of communities.

**1980 Parkland-Spanaway Comprehensive [Community] Plan**

The Parkland-Spanaway Comprehensive [Community] Plan was adopted by Pierce County in 1980. In addition to the Parkland and Spanaway communities, the plan also included the Midland and North Clover Creek Collins communities and the northwestern portion of Frederickson. In 1983, the Midland area was removed from the control of the 1980 plan and reverted to the control of the 1962 Pierce County Comprehensive Plan. The 1980 Parkland-Spanaway-Comprehensive [Community] Plan remained in effect as a component of the new Comprehensive Plan, but many aspects of the 1980 plan were not consistent with the new County Comprehensive Plan and consequently were superseded by the new Countywide plan and implementing Development Regulations-Zoning that became effective in July 1995.
**1988 Summit-Waller Community Plan**

The Summit-Waller Community Plan was adopted by Pierce County in 1989, under Ordinance Number 88-209. The plan area consisted of the northern portion of the Mid-County plan area, extending from Pioneer Avenue to State Route 512. This plan is a subarea plan of the larger 1962 Pierce County Comprehensive Plan. Like other subarea plans implemented before the new 1994 Pierce County Comprehensive Plan, the Summit-Waller Community Plan remained in effect; however it was inconsistent with many Countywide planning policies.

**1994 Pierce County Comprehensive Plan**

The Growth Management Act (GMA) was passed by the Washington State Legislature in 1990. It required Pierce County to update its existing Comprehensive Plan and Development Regulations. The GMA required Pierce County to develop and adopt a comprehensive plan which would control residential, commercial, and industrial growth.

In 1991, Interim Growth Management Policies were adopted as a transition between the 1962 Comprehensive Plan and the new plan required under the Growth Management Act. In 1992, the Pierce County County-Wide Planning Policies were adopted. The policies provided the framework and process by which Pierce County and the cities and towns within the County would establish urban growth areas, provide infrastructure and services, and preserve agricultural and natural resource lands.

In 1994, per the requirements of the Washington State Growth Management Act, Pierce County adopted a new Comprehensive Plan. The Pierce County Comprehensive Plan replaced the 1962 Pierce County Comprehensive Plan in its entirety. The plan established population projections, urban growth areas, and rural areas. The new County-wide plan became effective January 1995, with its implementing regulations becoming effective July 1995.

**Community Planning**

Although the Growth Management Act does not require comprehensive plans to provide for community plans, Pierce County Ordinance 90-47s directed County officials to prepare a community plans element of the Comprehensive Plan. The majority of unincorporated County residents live in community plan areas. Community plans must be consistent with the Comprehensive Plan and the GMA.

The community plans element of the Pierce County Comprehensive Plan envisions a local voice in how the Comprehensive Plan and its Development Regulations will be carried out in communities. This element provides the flexibility for communities to refine comprehensive plan land use designations and associated densities and make decisions about specific design standards that should apply in community planning areas. Preserving and building community character while ensuring an efficient and predictable development approval process is a central theme in community plans.
SCOPE OF THE COMMUNITY PLAN

LEGISLATIVE AUTHORITY TO DEVELOP THE PLAN

The Pierce County Comprehensive Plan Community Plans Element provides the authority for the preparation and adoption of community plans. This element requires that new community plan areas be established based on priorities such as public health, safety, or welfare; previous commitments by the County through legislative action to prepare a plan; and evidence of community support. Community plans can be initiated by Land Use Advisory Commissions through submittal of a petition to the Pierce County Executive and County Council that identifies the proposed area and identifies reasons why a community plan is needed or instigated by the Pierce County Executive, County Council, or Planning Commission in order to implement objectives, principles, and standards of the Comprehensive Plan. In 2001 by Resolution R2001-39s, the County Council authorized the initiation of a community plan for the Mid-County area.

In 2002, the County Council adopted Resolution R2002-65s, which required the community planning boards and the Planning and Land Services Department to use the adopted Upper Nisqually Valley, Gig Harbor Peninsula, and Parkland-Spanaway-Midland community plans, and implementing regulations for these plans, as a template for developing future community plans and regulations. Specifically, this Resolution encourages communities to use the existing menu of land use designations and classifications, employ the established use types and levels of use, recommend changes to administrative processes or development regulations that apply at a countywide scale (e.g., nonconforming use provisions and critical area and stormwater regulations), and adopt community plans prior to (at least nine months) the implementing regulations.

Resolution R2002-114 amended Resolution R2001-39s by increasing CPB representation to a total of eighteen members and indicating that all properties currently designated as Rural Separator should maintain that designation through the community planning process.

A community planning board (CPB) was formed in the winter of 2002. The CPB was tasked with the responsibility of developing the community plan. The CPB consisted of 17 members with a variety of backgrounds representing a variety of interests. The first meeting of the community planning board was held in December of 2002.

Ordinance No. 2005-8s2 adjusted the Mid-County Community Plan boundary by adding parcels in the northern portion of the plan area in order to be consistent with provisions of Ordinance 2004-87s.

PURPOSE AND USE OF THE COMMUNITY PLAN

The Mid-County Community Plan gives the residents, businesses, property owners, and the County a clear, more detailed sense of how the community should develop in the future and
what standards could be utilized to control the character of the community. The desired outcomes of the Mid-County Community Plan include:

- Update the Summit/Waller Community Plan;
- Development of a long-range vision for the Mid-County communities;
- Evaluate the vision for the Mid-County communities in light of the Pierce County Comprehensive Plan and make refinements as necessary to ensure consistency between the overall Countywide plan and the community plan; and
- Identify actions necessary to implement the policies of the community plan, including: adopting or revising land use regulations; identifying priorities for use of public funds to develop physical improvements, such as roads, sidewalks, street landscaping, street lights, water-related improvements, and park development; social programs; economic programs, etc.

**COMPONENTS OF THE COMMUNITY PLAN**

**VISION STATEMENTS AND POLICIES**

The vision statements and all of the policies (goals, objectives, principles, and standards) were developed through citizen input. When applying the policy statements, each should be afforded equal weight and consideration.

**VISIONING PROCESS AND VISION STATEMENTS**

Visioning is typically completed through a series of public meetings or workshops structured to allow the community to articulate hopes for the future. Statements, thoughts, and ideas brought forth in the visioning process become the basis for the visions, goals, objectives, and principles of the community plan.

A vision is a statement of hope within the best of circumstances. It is placed on the horizon of the future, provides direction, and is a reflection of who and what the community is and what it wants to become.

Vision statements can be either: 1) broad - painting a picture of what the community should strive to be like, physically and socially; or 2) focused – to express how the concerns, values, and hopes of the community should be reflected in various topics.

**GOALS**

Goals describe a desirable future for the community: identifying who, what, why, and how the broad values and hopes set forth in the vision statement will be accomplished. Goals provide the framework from which objectives, policies (principles and standards), and implementing actions and recommendations will be developed.
OBJECTIVES
Objectives are statements which specifically define goal actions.

PRINCIPLES AND STANDARDS
Principles set a particular course of action to accomplish objectives. Standards, quantitative or qualitative, are specific benchmarks or targets to be accomplished in the ongoing development of the community.

IMPLEMENTING ACTIONS
Implementing actions are refinements and changes to policy documents, regulations, capital facility plans, and statements directing agencies and community groups to revise or develop plans, regulations, programs, and other non-regulatory measures. Implementing actions set forth a direction or mechanism to accomplish vision and policies.

CONSISTENCY WITH THE PIERCE COUNTY COMPREHENSIVE PLAN
The goals, objectives, principles, and standards in the Mid-County Community Plan are consistent with the provisions in the Pierce County Comprehensive Plan. Although the community plan proposes to change land use designations within the area, the proposed designations are already defined and policy direction is included in the County Comprehensive Plan. No new land use designations will be added to the Comprehensive Plan. The plan does propose rezoning of certain areas to implement the existing land use designations. The rezoning utilizes existing zone classifications contained with the Pierce County Zoning Code. No new zone classifications are proposed.

PUBLIC INVOLVEMENT
Development of the plan incorporated a variety of public involvement strategies including the formation of the Community Planning Board and committees, open houses, and various surveys. These public involvement techniques ensure that the plan is developed as a representation of the general will and values of the community.

COMMUNITY PLANNING BOARD
The development of the Mid-County Community Plan could not have been accomplished without the Mid-County Community Planning Board (CPB). The CPB was appointed in the winter of 2002 and consisted of eighteen members representing a variety of interests and geographic locations of the community.

The CPB was charged with the following responsibilities: 1) serving as a sounding board for the community; 2) developing a vision and goals for the community plan area; 3) guiding the development of policies and map changes that address community concerns while remaining
consistent with the Comprehensive Plan; and 4) forwarding a recommended plan to the Pierce County Planning Commission and Pierce County Council.

COMMITTEES

Resolution R99-103s directed the Frederickson Community Planning Board to hold joint meetings with the Mid-County Community Planning Board (CPB) to discuss issues of joint concern, specifically the Canyon Road corridor. Members of both boards met with the Makers Architecture and Urban Design firm to discuss a consistent design approach for properties south of SR 512 that abut Canyon Road East. The Mid-County CPB incorporated several of the design principles for Canyon Road East that were adopted in the Frederickson Community Plan.

OPEN HOUSES

The Community Planning Board held its first open house in March 2005. The open house was well attended by the community, with over 130 people attending. The open house provided an overview of the planning process and provided information on the work completed to date by the Community Planning Board.

An open house showcasing the Community Planning Board’s final recommendations was held in July of 2005 in conjunction with the Mid-County Advisory Commission’s study session for the plan. This open house gave the general public the opportunity to review and comment on the draft plan prior to its transmittal to the Pierce County Planning Commission and Pierce County Council. This open house also provided the Community Planning Board with important community feedback regarding their recommendations. Both open houses were advertised in the Tacoma News Tribune and with a community-wide mailing distributed to 16,776 residences or businesses within and adjacent to the plan area boundaries.

SURVEY

2001 COMMUNITY SURVEY

In December 2001, a survey was distributed throughout the community to solicit input on a variety of issues such as perceived quality of life, adequacy of facilities and services within the plan area, quality of the natural environment, and location and intensity of residential, commercial, and industrial uses.

The survey was conducted between December 2001 and February of 2002. At the time the survey was conducted, it was estimated that the plan area contained 12,989 households. The survey was mailed to every third household totaling 4,329 households located within and adjacent to the community plan area boundaries. It contained 75 questions broken down into different categories: Quality of Life; Natural Environment; Economic Element; Community Character; Transportation; Public Facilities; Public Services; Land Use; and Household Characteristics. At the end of the survey, respondents were given the opportunity to add their own comments regarding the community or the survey. The results of the survey helped PALS
staff and members of the Mid-County Community Planning Board assess community views regarding a variety of issues and were used as an aid in the development of the community plan.

A total of 664 surveys were completed and returned. This equates to a return rate of 6.5%. Statistically, a sufficient number of surveys were returned to obtain an accurate representation of household opinion to within approximately +/- 5 percent.

In regard to quality of life, the survey noted that the areas of greatest concern were traffic, development patterns, local job opportunities, and availability of recreational areas. The areas of least concern were the quality/availability of emergency services and quality of schools.

**SUMMARY OF THE MID-COUNTY COMMUNITY PLAN**

The Mid-County Community Plan contains policies and implementing actions for five subject areas or elements: Land Use Element, Community Character and Design Element, Natural Environment Element, Economic Element, and the Facilities and Services Element.

**LAND USE ELEMENT**

The Land Use Element addresses the location and intensity of land uses within the communities. A complete description of land use designations and their implementing zone classifications can be found in this element.

**COMMUNITY CHARACTER AND DESIGN ELEMENT**

The Community Character and Design Element addresses community character, heritage, and social interaction. This element also contains policies that will guide the design of both commercial and residential development.

**NATURAL ENVIRONMENT ELEMENT**

The Natural Environment Element includes consideration of the natural resources found in the area. Policies contained in this element define existing resources and guide future development with consideration of on-site environmental constraints.

**ECONOMIC ELEMENT**

The Economic Element analyzes the economy of the area and considers a myriad of opportunities to diversify the economic base. The element also provides guidance on ways the community can maintain a viable economic environment.
**Facilities and Services Element**

The Facilities and Services Element addresses infrastructures and services needed to support the proposed land use growth and development. Infrastructure includes capital facilities such as roads, trails, sewage disposal, parks, and utility lines. The policies within the community plan identify the capital improvements that are necessary to support the plan (sewers, water, sidewalks, etc.) and discuss potential partnerships and sources for funding opportunities.

**Plan Monitoring**

The Plan Monitoring section provides a framework both for monitoring the various actions undertaken to implement the plan and for offering recommendations to make adjustments to the actions in order to better fulfill each of the visions in the plan. This framework provides a means for measuring the effect of each action, identifies participants and their roles in monitoring the actions, lays out time frames for monitoring, and specifies how the monitoring program should be documented. Information from this program will be used in the next plan update cycle to help identify what changes the community plan may need in order to attain specified goals and meet the visions in the plan.

**Implementation**

The plan also contains proposed amendments to the Pierce County Comprehensive Plan and Development Regulations which serve to implement various plan policies. These proposed amendments will become effective upon final plan adoption.

**Vision Statement**

The citizens of Summit-Waller, North Clover Creek Collins, and Summit View envision a unique residential community that separates urban densities with rural development and environmentally sensitive areas. A rural atmosphere that accentuates the pastoral character by emphasizing natural characteristics, limited urban amenities, and agrarian activities. A series of commercial areas that are affixed along major traffic corridors that aim to become separate, vibrant commercial centers that meet the daily needs of local residents. An important component to Pierce County’s transportation network that not only serves local community needs but also the growth in surrounding communities and regional economic centers.

The communities of Summit-Waller, North Clover Creek Collins, and Summit View strive to:

- Conserve the natural environment and natural processes of the ecosystems present in the community and surrounding areas and address opportunities to restore the natural environment
- Protect and foster the unique rural atmosphere of the community, promote a clear distinction between urban and rural areas, and enhance future and existing residential and commercial developments by focusing on the limited needs of the community and the desire for certain amenities
• Allow small business and limited industry throughout the community, improve existing commercial activity along Canyon Road East and 112th Street East and recognize these roads as vital transportation corridors for economic development, and foster natural resource operations within the community
• Emphasize and preserve the rural area within the community. Associate the intensity of land uses with urban or residential character, surrounding activities, development patterns, and environmental constraints
• To provide public facilities and services and amenities in appropriate areas and acknowledge the capacity of frequently traveled roads and improve road conditions
Chapter 2: Land Use Element

**Introduction**

The Land Use Element of the Mid-County Community Plan provides direction regarding the location and intensity of land uses. This element is intended to supplement and further refine the Land Use Element of the Pierce County Comprehensive Plan. Where the community plan provides specific guidance regarding land uses, the policy language of this plan will govern. Where the community plan does not provide specific guidance, the reader is directed to utilize the land use objectives, principles, and standards of the Pierce County Comprehensive Plan.

The Land Use Element addresses the location and intensity of commercial, industrial, residential, and civic land uses. The element contains two main components: visions, objectives, principles, and standards that provide policy direction and guidance; and, regulatory and non-regulatory implementation actions to carry forth the policy direction.

**Description of Current Conditions**

The residents and business owners of Mid-County are proud of the rural character that has defined their community for decades. The character of Mid-County has been threatened by the drastic development that has occurred in adjacent communities in the past 30 years. In the late 1960s, Mid-County and unincorporated neighbors were primarily rural communities containing farms and large tracts of land. In 1972, the construction of State Route 512 was completed, opening the door for development.

In 1995 Pierce County implemented a Comprehensive Plan in accordance with the Washington State Growth Management Act. The Plan directs growth into urban areas where adequate facilities and services exist to serve urban populations. The Comprehensive Plan assigned commercial growth to a portion of 112th Street East and along Canyon Road East, south of SR 512, while the rest of the community was designated for residential or resource uses. The Comprehensive Plan did not address whether certain neighborhoods should or should not have higher densities, if environmental constraints should limit development, or identify unique or significant places in individual communities.

The implementing regulations for the Comprehensive Plan provided for consistent regulations throughout unincorporated Pierce County and failed to recognize individual communities’ desires. The regulations included requirements for landscaping and stipulated the allowable range of densities for each zone classification. Revisions were made to the regulations in the late 1990s to include standards for sidewalks, lot size, curbs, and gutters. The Comprehensive
Plan did not address signs, architecture, site layout, pedestrian facilities, or lighting. These items were left for communities to decide through a more interactive community plan process.

The following information provides background on the land development patterns and existing land use designations and zoning classifications.

**EXISTING LAND USES**

The Pierce County Assessor-Treasurer’s Office classifies how parcels are used for purposes of calculating assessed value for taxation. The Pierce County Planning and Land Services Department routinely uses this information to determine distribution of land uses within specific areas. The Assessor’s information is known to periodically contain errors, but is considered accurate for planning purposes. The Assessor’s information reflects only how land is currently being used and does not reflect zoning.

The following table summarizes the current uses of land within Mid-County based upon Assessor information:

<table>

Pierce County Comprehensive Plan | Mid-County Community Plan
CURRENT COMPREHENSIVE PLAN DESIGNATIONS AND ZONING CLASSIFICATIONS

The Pierce County Comprehensive Plan establishes seven different land use designations within Mid-County. These land use designations are Moderate Density Single Family (MSF), High Density Residential District (HRD), Mixed Use District (MUD), Community Center (CC), Rural Separator (RSep), Rural Neighborhood Center (RNC), and Agricultural Resource Lands (ARL). These land use designations indicate the type, intensity, and density of land uses authorized by the Comprehensive Plan. Refer to Map H-3: Historic Land Use Designations.

The MSF and HRD designations are residential in nature, while the MUD and CC designations are auto-oriented commercial that also allow residential uses. These land use designations are implemented on a parcel specific basis through zoning. The land use designations do not necessarily reflect the current use of land. For example, property used for heavy industrial purposes could be designated MSF, a residential land use designation.

The following table summarizes the land use designations in terms of acreage:

<table>

Land use designations are shown on Map H-3: Historic Land Use Designations and Map H-4: Historic Zoning.

MODERATE DENSITY SINGLE-FAMILY

The Moderate Density Single-Family (MSF) land use designation/zone classification is intended to provide areas for urban single-family and two-family residential development at densities of 4-6 dwelling units per acre. The MSF designation is the predominant designation in Summit View. Approximately 12% of Mid-County (1,711 acres) is designated as MSF.
COMMUNITY CENTER

The Community Center (CC) designation has as its focus a significant traffic generator around which develops a concentration of other commercial office, services, and some high-density residential development. The commercial activity is drawn from a customer base of more than one neighborhood. The CC designation includes 215 acres located at the intersection of SR 512 and Canyon Road East. The CC designation accounts for <2% of the community.

HIGH DENSITY RESIDENTIAL DISTRICT

The High Density Residential District (HRD) designation is intended to provide areas of multifamily and high density single-family housing along with limited neighborhood commercial retail and service uses. Allowed residential densities in the HRD range from 6 to 25 dwelling units per acre. There is one area designated HRD located in the vicinity of 112th Street East between Golden Given and Vickery Avenue. This designation accounts for less than 1% of the community and contains approximately 104 acres.

MIXED USE DISTRICT

The Mixed Use District (MUD) designation provides for auto-oriented commercial and land-intensive commercial uses along major arterials, state highways, and major transit routes. Commercial activity in MUDs serves a customer base beyond the surrounding neighborhoods or community and is typically located along a roadway used by residents of more than one community. The MUD designation also allows for multifamily residential uses. The majority of Canyon Road East located south of 116th Street East and an area east of Canyon Road East along 112th Street East is designated as MUD. The MUD designation accounts for approximately 916 acres of land, totaling approximately 5% of the community.

RURAL SEPARATOR

The Rural Separator (RSep) designation allows a density of one dwelling unit per five acres. Density incentives are provided when 50 percent or more of the property is designated as open space. The Rural Separator (RSep) zone classification includes rural lands intended to provide a buffer or separation between urban zone classifications. The RSep designation accounts for approximately 10,896 acres of land, totaling approximately 75% of the community.

RURAL NEIGHBORHOOD CENTER

The Rural Neighborhood Center (RNC) designation serves the everyday needs of local rural residents. The RNC provides limited convenience shopping and services, is limited in size, and retains a scale and intensity that is appropriate for maintaining the rural character. The RNC designation accounts for approximately 49 acres of land, totaling less than 1% of the community.
Agricultural Resource Lands (ARL) are distinct from rural lands and include agricultural lands that have been designated as having long-term commercial significance. The Comprehensive Plan identifies criteria and guidance for protection, management, and future development of lands designated Agricultural Resource Lands. The key criterion for defining Agricultural Resource Lands is the presence of the County’s most productive agricultural soil types and their associated production yield. The ARL designation accounts for approximately 746 acres of land, totaling approximately 5% of the community.

Description of Desired Conditions

One of the most significant issues addressed through the community planning process is land use. How land is utilized within a community directly affects the community’s character and the quality of life perceived by its residents. The utilization of land also directly influences many other planning considerations, including but not limited to transportation system planning, provision of water and sewer infrastructure, and protection of the natural environment. In regard to land use, members of the Mid-County Community Planning Board have reviewed the Pierce County Comprehensive Plan in light of the existing conditions present in the plan area. This review has identified a series of modifications that should be made to the Pierce County Comprehensive Plan in order to assure that this plan accurately reflects the needs and desires of the community. These modifications include changes to the land use designations and zoning classifications within the plan area and the adoption of a series of new policies related to land use.

Proposed Designations and Zoning Classifications

The community plan retains a wide-range of land use designations that apply within the plan area. Three additional designations are proposed to be applied in the community: High Density Residential, Neighborhood Center and Employment Center. A total of eight land use designations are proposed. The urban designations are: Moderate Density Single Family (MSF), Community Center (CC), Neighborhood Center (NC), High Density Residential District (HRD), and Employment Center (EC). The rural designations are: Rural Separator (RSep), Rural Neighborhood Center (RNC), and Agricultural Resource Lands (ARL).

The range of zoning classifications would be expanded from the current seven zones to eleven zones under the community plan. New zones that would be introduced to the area include Single Family (SF), Residential Resource (RR), Neighborhood Center (NC), Moderate High Density Residential (HRD), and Community Employment (CE). The new zones are proposed in order to more closely manage the location, type, and intensity of land uses that occur within certain areas of the community. The proposed modifications are discussed in detail below:
**HIGH DENSITY RESIDENTIAL DISTRICT**

The High Density Residential District (HRD) designation is intended to be composed of multifamily and high density single-family and two-family housing and limited neighborhood retail and service commercial uses.

**PROPOSED ZONING**

The High Density Residential District (HRD) plan designation will be implemented by the Moderate High Density Residential (MHR) zone. The MHR zone differs from Pierce County's current HRD zone in that it does not allow for commercial uses. The MHR zone permits high density single-, two-, and multifamily housing and compatible civic uses. The residential density range for this zone is eight to twenty-five dwelling units per acre. Areas zoned MHR are located primarily to provide transitions between centers, districts, and residential neighborhoods.

**MODERATE DENSITY SINGLE-FAMILY DESIGNATION**

The community plan retains the Moderate Density Single-Family (MSF) designation as the dominant land use type for the Summit View area. This designation allows for single-family dwellings. Commercial and industrial uses are prohibited. Specific densities are based on physical constraints on the land and the availability of urban services such as sewers. The designation generally allows two to six dwelling units per acre. The land area to which this designation applies would slightly decrease from that what is designated under the Pierce County Comprehensive Plan. Under the Pierce County Comprehensive Plan, 1,711 acres are designated MSF. MSF acreage would slightly increase to 1,743 acres under the community plan.

**PROPOSED ZONING**

The Moderate Density Single-Family plan designation will be implemented by two zoning classifications: Single Family (SF) and Residential Resource (RR). The Moderate Density Single-Family (MSF) zone is not applied in the Mid-County Plan area.

The first zone used to implement the MSF designation is the Single Family (SF) zone. The zone is intended to provide residential areas that are less dense and more homogenous than those developed under the MSF zone. The primary land use allowed within this classification is moderate density single family and compatible civic uses. Single-family detached housing is the primary housing type that is permitted. Duplexes and other multiple family housing types are prohibited. The SF zone permits a density of four dwelling units per acre. The zone is applied in the less environmentally constrained areas of the urban plan area as a means of reducing impacts to the current natural drainage systems while continuing to allow urban density residential development. Approximately 1,196 acres are proposed to be zoned SF.

The second zone used to implement the MSF designation is the Residential Resource (RR) zone. The zone is intended to provide for lower residential densities, increased open space, and reduced impervious surfaces in the environmentally constrained areas of the urban plan area in order to better protect the high priority resources and their significance for surface water management in the area. The zone classification is the least intensive of Pierce County’s urban...
residential zones, permitting a density of one to three dwelling units per acre. The RR zone is currently used by Pierce County in the adjacent communities of Parkland, Midland, Spanaway, South Hill, and Frederickson to provide higher levels of protection to Clover Creek and other high priority resources in those communities. Approximately 2% (546 acres) of the Mid-County plan area would be zoned RR.

**COMMUNITY CENTER**

The Community Center (CC) land use designation will continue to apply within the community plan area. The primary role of the Community Center is to provide retail and service opportunities that Mid-County residents are likely to access on a weekly or frequent basis such as grocery stores, restaurants, or banks. Community Centers are intended to be both pedestrian and auto accessible where the pedestrian is clearly comfortable in the center, but the automobile also has a presence. One Community Center is designated at the intersection of SR 512 and Canyon Road East.

**PROPOSED ZONING**

The Community Center plan designation will continue to be implemented by the Community Center (CC) zone classification. The CC zone is similar to Pierce County’s current CC zone classification. Residential densities are 10-22 units per acre. The uses permitted in the zone are generally the same, with a few minor modifications such as no longer allowing contractor yards. The total amount of area zoned CC would be approximately 373 acres, a 1% increase over that which is zoned CC under the Comprehensive Plan. The increase would be the result of rezoning parcels along Portland Avenue near 112th Street East to CC and areas in immediate vicinity of the current CC along 112th Street East.

**NEIGHBORHOOD CENTER**

The primary role of the Neighborhood Center designation is to provide local residents daily goods or frequently needed services without having to travel to large commercial areas on SR 7/Pacific Avenue and SR 161/Meridian Avenue. The Neighborhood Center zone classification is a concentrated mix of small-scale retail and service commercial and offices that serve the daily needs of residents within the immediate neighborhood.

**PROPOSED ZONING**

The Neighborhood Center (NC) designation will be implemented by one zone classification: Neighborhood Center (NC). The proposed Neighborhood Center zone classifications are located along Canyon Road East at the intersections of 128th Street East, 144th Street East, and 160th Street East and along 112th Street East at the intersections of Waller Road, Vickery Avenue and Bingham Avenue.

The uses permitted in the NC zone classification are oriented to small-scale retail sales or services and a wide range of civic uses. Uses such as daycare centers, small grocery stores, doctor or dentist offices, and espresso sales would be allowed within the zone.
**Employment Center**

The Employment Center (EC) designation is currently not applied within the Mid-County plan area. The EC designation provides land for industrial, manufacturing, and office jobs. Uses in the EC range from land intensive, heavy industrial to light manufacturing, assembly, wholesale activities, and corporate office and office park development. Commercial uses subordinate to and supportive of employment uses are also permitted. The community plan would apply the EC designation to approximately 821 acres within the plan area.

**Proposed Zoning**

The EC designation would be implemented through the Community Employment (CE) zone, a light industrial zone. The CE zone differs from the EC zone in that certain heavy industrial uses, such as basic manufacturing and hazardous materials storage and processing are not permitted. The CE zone serves to provide for additional land area for the Frederickson Employment Center, an area south of the plan area, and utilize the access to SR 512 from 112th Street East. Commercial retail and service uses would be limited. The CE zone would be applied in several areas currently zoned MUD: areas along 112th Street East and portions of Canyon Road East (south of 118th Street East). The total acreage of CE zoned land would be approximately 821 acres.

**Rural Separator**

The community plan retains the Rural Separator (RSep) designation as the dominant land use type for the Mid-County plan area. This designation is the same as the general Pierce County designation and allows for single-family or two-family dwellings, resource uses and limited civic uses. Multifamily housing, commercial and industrial uses are prohibited. The designation allows for one dwelling unit per five acres. The land area to which this designation applies would slightly decrease from that what is designated under the Pierce County Comprehensive Plan. Under the Pierce County Comprehensive Plan, 10,896 acres are designated RSep. RSep acreage would be decreased to 10,696 acres under the community plan.

**Proposed Zoning**

The Rural Separator plan designation will be implemented by one zoning classification: Rural Separator (RSep). The RSep zone that is proposed by the community plan is generally the same as Pierce County’s current RSep zone classification. The primary land use allowed is rural housing, compatible civic and resource uses. The minimum density for the zone (one dwelling unit per five acres) and the maximum density for the zone (two units per five acres) remain unchanged. The total amount of area zoned RSep would decrease by 211 acres. The decrease would be the result of rezoning parcels along 112th Street East (between 44th Avenue East and 50th Avenue East) from RSep to either SF, NC or CE; the creation of Rural Neighborhood Centers (RNC) at the intersection of 96th Street East and Canyon Road and 72nd Street East and Canyon Road; and an RNC expansion at 72nd Street East and Waller Road.
**Rural Neighborhood Center**

The Rural Neighborhood Center plan designation will be implemented by one zoning classification: Rural Neighborhood Center (RNC). The RNC includes areas which have established commercial uses that provide limited convenience shopping and services that meet the daily needs of the surrounding rural area.

**Proposed Zoning**

The RNC zone that is proposed by the community plan is generally the same as Pierce County’s current RNC zone classification. The total amount of area zoned RNC would be approximately 2 acres less than that which is zoned RNC under the Comprehensive Plan. The increase would be the result of expanding the RNC at 72nd Street East and Waller Road, applying new RNCs at the intersections of 72nd Street East and Canyon Road East and 96th Street East and Canyon Road East. A decrease in acreage would occur at the RNC located at 84th Street East and Canyon Road due to the rezoning of parcels from RNC to RSep to acknowledge the current residential uses and publicly owned parcels not intended for commercial uses.

**Agricultural Resource Lands**

The Agricultural Resource Lands designation is implemented by the Agricultural Resource Lands (ARL) zoning classification. Agricultural Resource Lands includes land in the plan area that is primarily devoted to the commercial production of agricultural products and is applied to parcels outside of the urban growth area that meet Comprehensive Plan criteria related to soil and other conditions.

**Proposed Zoning**

The ARL zone that is proposed by the plan is generally the same as Pierce County’s current ARL zone classification. The total amount of area zoned ARL would be approximately 11 acres less than that which is zoned ARL under the Comprehensive Plan. The decrease would be the result of rezoning one parcel along River Road from ARL to RSep to acknowledge the current soil conditions that are not suitable for agricultural production.

The following tables and maps illustrate the changes in land use designations and zone classifications contained within the community plan.

### Land Use Policies

#### Goals

The communities of Summit-Waller, North Clover Creek Collins, and Summit View strive to emphasize and preserve the rural area within the community. The intensity of new land uses should be consistent with the existing urban or residential character, surrounding activities, development patterns, and environmental constraints.

#### Rural Residential

**Goal MC LU-1**  
Preserve the natural, forested and pastoral character of rural lands outside the Urban Growth Area.
MC LU-1.1 Ensure that development which does occur in rural areas is planned in an environmentally conscientious manner as to be compatible with the desired character through the control of intensity and density of land uses and protection of open space.

MC LU-1.2 The preservation of agricultural lands is a priority.

MC LU-1.3 Careful planning shall assure urban levels of service do not occur in the rural area.

GOAL MC LU-2 The Rural Separator designation is intended to protect and preserve the rural-residential character of the area; protect rural lands from continued urban-suburban sprawl; protect groundwater and surface water quality, and provide opportunities for recreational activities.

MC LU-2.1 The continuation of agricultural practices should be encouraged and shall be promoted when such practices are conducted in an environmentally responsible manner.

MC LU-2.2 Land uses shall be limited primarily to low density residential, agricultural, forestry, and recreational uses.

MC LU-2.3 Provisions should be made to allow for limited civic and public safety uses when appropriately designed so as to be compatible with their surroundings.

MC LU-2.4 Limited provisions may be made for light commercial and industrial uses within the Rural Separator area when directly associated with existing agricultural, forestry, or natural resource related uses.

MC LU-2.4.1 Examples of such limited light commercial and industrial uses include agricultural product and supply sales, horticultural nurseries, veterinary services, and commercial stables.

MC LU-2.5 Recreational uses should be limited primarily to parks, walking, equestrian, and biking trail systems, athletic fields, golf courses, and similar uses which maintain a significant majority of land in a vegetated state.

GOAL MC LU-3 Allow manufactured homes as accessory dwelling units.

MC LU-3.1 Consider increasing the maximum square footage of an accessory dwelling unit in the rural area to 1,300 square feet.

GOAL MC LU-4 A range of rural housing densities shall be allowed to occur on Rural Separator lands.

MC LU-4.1 The allowed density shall range from 1 dwelling unit per 5 acres to a maximum of 2 dwelling units per 5 acres.

MC LU-4.2 Maximum density shall be allowed only when the natural environment can accommodate this density and at least 50% of the gross acreage of the land proposed to be developed is dedicated in perpetuity as open space through deed restriction and other appropriate mechanisms.

MC LU-4.2.1 This open space area should be located in a tract separate from any newly created lots.
GOAL MC LU-5

Ensure that impacts of existing industrial operations to surrounding uses and the environment do not increase.

MC LU-5.1

Do not permit expansion of nonconforming industrial operations except minor expansion that does not involve additional land area and which is accompanied by improvements which make the operation more compatible with surrounding uses.

MC LU-5.2

Provide for implementation mechanisms to allow for continuance of legally existing contractor’s yards and other legally existing operations associated with surface mining after mining operations have been discontinued. Uses prohibited in the community plan, such as concrete recycling, shall not be authorized.

MC LU-5.2.1

Such mechanisms should provide for site-specific review, citizen participation, and imposition of design and performance standards to protect surrounding land uses, the community, and the environment from adverse impacts.

MC LU-5.2.2

Such mechanisms would not be intended to be precedents for rezoning of adjacent properties to less restrictive zoning classifications.

GOAL MC LU-6

Through requirements and incentives, gradually reduce impacts of industrial operations upon surrounding uses and the environment.

MC LU-6.1

As industries cease to operate, including the extraction of gravel, promote new uses consistent with the goals, objectives, and policies of this plan, compatible with residential land uses and the community’s rural character.

RURAL COMMERCIAL

GOAL MC LU-7

Strictly control commercial expansion or introduction of new commercial uses to ensure compatibility with residential land uses and prevent strip development.

GOAL MC LU-8

The Rural Neighborhood Centers (RNC) located at 96th Street East and Canyon Road East, 84th Street East and Canyon Road East, 72nd Street East and Canyon Road East, and 72nd Street East and Waller Road are recognized as important neighborhood civic and commercial focal points in the rural area.

MC LU-8.1

RNCs shall strive to improve architectural characteristics that will shape and enhance the appearance of the center.

MC LU-8.2

Appropriate commercial uses shall be limited to food stores and the sale of general merchandise in buildings that do not exceed 5,000 square feet of building footprint and those resource uses such as agricultural sales.

MC LU-8.3

Appropriate civic uses shall be encouraged in RNCs.

MC LU-8.3.1

These uses shall be limited to daycare centers, community service centers, postal services, neighborhood parks, churches, police, and fire safety services.

MC LU-8.4

New residential uses shall be prohibited in RNCs.

MC LU-8.4.1

Additions and remodels to existing dwelling units may be permitted.
MC LU-8.5  Noise, dust, odorous gas, and lighting shall not be permitted to adversely affect the adjacent residential neighborhood.

MC LU-8.6  New commercial and civic uses shall be buffered from adjacent lower intensity rural uses outside of the RNC designation.

MC LU-8.7  All new or redeveloping civic and commercial uses in rural centers shall be subject to commercial design standards.

RESOURCE LANDS

GOAL MC LU-9  Recognize agriculture as an important resource for the plan area.

MC LU-9.1  De-designate Agricultural Resource Lands within the plan area that can demonstrate that they do not meet the soil criteria identified in the Comprehensive Plan.

MC LU-9.2  Give high priority to agriculture in land acquisition programs sponsored by the County, such as Conservation Futures, Purchase of Development Rights, and the Conservation District Assessment.

MC LU-9.2.1  The Agricultural Resource Lands designated properties in the north section of the community planning area shall be given high priority because of the value of the agricultural soils in those areas.

URBAN RESIDENTIAL

GOAL MC LU-10  Implement distinct zoning districts for a variety of residential choices including: single-family, multifamily, senior housing, and mixed-use development.

MC LU-10.1  Low residential densities should be located in the vicinity of environmentally constrained lands such as wetlands, floodplains, lands with hydric soils, and aquifer recharge areas.

MC LU-10.2  High density residential should be located where infrastructure is available.

MC LU-10.3  Establish the High Density Residential District (HRD) Designation.

MC LU-10.4  The primary uses within the High Density Residential District (HRD) designation shall be moderate to high density single-family detached, two-family, attached single-family, and multifamily.

MC LU-10.5  Provide incentive-based residential density regulations.

MC LU-10.5.1  Provide on-site density credits for the Residential Resource zone.

GOAL MC LU-11  Allow non-residential uses within residential areas.

MC LU-11.1  Limited non-residential uses such as schools and daycares should be allowed within residential areas.
Non-residential activity should be scaled and sized appropriately to ensure compatibility within the neighborhood.

**GOAL MC LU-12**

Ensure residential rezone applications are consistent with the intent, goals, objectives, and standards as set forth in the Mid-County Community Plan. Residential rezones may be allowed when the following criteria are met:

**MC LU-12.1**
A PDD shall accompany all rezone applications;

**MC LU-12.2**
If the request is to up-zone from Residential Resource to Single-Family, it must be demonstrated that the environmental constraints qualifying the property for such classification no longer exist on the site;

**MC LU-12.3**
An analysis of market vacancy has demonstrated that there is a need for higher density within the Mid-County Community Plan area. The analysis must consider the availability of buildings for the same type of use and shall demonstrate why the rezone is necessary. The analysis shall not be an analysis of market potential.

**MC LU-12.4**
For any rezone request to allow higher densities, the site must be located on an arterial within 1,000 feet of a transit stop.

**MC LU-12.5**
Compatibility with surrounding uses shall be maintained.

**MC LU-12.6**
For any rezone request to allow higher densities, connection to sewers shall be required.

**MC LU-12.7**
The Examiner shall provide written findings that the proposed zone and PDD implement the goals, objectives, and standards of the designation better than the existing zone.

**Urban Commercial**

**GOAL MC LU-13**
Encourage commercial centers, corridors, and districts to contain a diverse mix of uses.

**MC LU-13.1**
Recognize and support the Community Centers near SR 512 and Portland Avenue and SR 512 and Canyon Road as commercial and limited mixed use residential areas, whose growth must be nurtured in a motor vehicle-oriented market environment with a balance of pedestrian and transit facilities.

**GOAL MC LU-14**
The Neighborhood Centers (NC) located along Canyon Road East at the intersections of 128th Street East, 144th Street East and 160th Street East and the NCs along 112th Street East at the intersections of Waller Road, Bingham Avenue, and Vickery Avenue are recognized as important neighborhood civic and commercial focal points.

**MC LU-14.1**
New developments in NCs shall strive to improve architectural characteristics that will shape and enhance the appearance of the 112th Street East and Canyon Road East corridors.

**MC LU-14.2**
Any future expansion of the land utilized as an NC shall be on those parcels adjacent to the existing centers.
MC LU-14.2.1 Under no circumstances shall the expansion cause an NC to exceed 55 acres in size.

MC LU-14.3 Any development within an NC shall have access onto a major or secondary County arterial road.

MC LU-14.4 No new NCs shall be created after the adoption of the Mid-County Community Plan.

GOAL MC LU-15 Provide for the orderly transition to other uses of older residential or commercial areas that are no longer viable for their original use, scale, or intensity of use.

MC LU-15.1 Ensure that the types of commercial uses permitted are those that will not have unacceptable adverse impacts on surrounding land uses or the environment due to hours of operation, noise, traffic, light and glare, or other causes.

MC LU-15.2 The management of areas in transition shall balance the needs of existing residents and businesses with the need to accommodate new uses.

GOAL MC LU-16 Identify and utilize public and private sector incentives and methods in the establishment of uses and developments in areas where redevelopment and revitalization will improve service, visual attractiveness, and quality of life.

GOAL MC LU-17 Encourage the appropriate use of areas adjacent to heavily traveled arterials while minimizing land use and traffic conflicts.

MC LU-17.1 Identify arterials that are appropriate for continued or future office and service commercial development, and mixed use development (retail, service, and office commercial and residential).

GOAL MC LU-18 A Mixed Use District designation should be established in the 104th St E and Canyon Road E area to create a transition between surrounding residential, civic and, commercial uses.

MC LU-18.1 The Mixed Use District designation should allow for a mix of commercial retail, service, office, compatible light industrial and residential uses. Residential uses may include single-family and multi-family development with densities between 12 and 25 units per acre.

GOAL MC LU-19 Seek to secure a broad industrial, business, and research base for the greater community by ensuring that adequate land, public facilities and services, and street capacities are available for future industrial growth.

MC LU-19.1 Through public and private efforts, there shall be an identification of small properties which have the potential to be assembled into parcels large enough for industrial development.

MC LU-19.2 Uses which support industrial and warehouse activities should be located near those uses in areas designated Employment Center.
Manufacturing operations may be located within other civic and commercial areas as long as such sites are compatible with the use intensity of the surrounding area.

Industrial developments shall be separated from residential areas through the use of aesthetically pleasing and effective methods (e.g., vegetative buffers, landscaped berms, fences, walls, setbacks, etc.).

All storage yards shall be entirely screened from the view of adjacent properties which contain dissimilar uses.

Promote the establishment of low and moderate intensity industrial, research, and office activities in Community Employment (CE) areas along the urban portions of 112th Street East and Canyon Road East where such uses are or can be made compatible with surrounding non-industrial uses through adequate separation, buffering, and sensitive placement of buildings, loading areas, materials storage, and parking.

Retailing of goods and services shall be limited to bulk commodities and large items requiring on-site warehousing (e.g., building materials, commercial equipment, and supplies).

The following list of actions needs to be completed in order to implement the policies contained within this plan. They are arranged according to the timeframe within which each should be completed: short, medium, or long term. Short-term actions should occur within one year of plan adoption. Mid-term actions should be completed within 2-5 years. Long-term actions should be completed within 5-10 years of plan adoption. The entity or entities responsible for leading the effort to complete the action item is listed in parenthesis following the action. Actions are assigned to the Land Use Advisory Commission (LUAC), Pierce County Planning and Land Services (PALS), Pierce County Economic Development (ED), Pierce County Parks and Recreations (Parks), Pierce County Public Works & Utilities (PWU), and Tacoma-Pierce County Health Department (TPCHD).

**SHORT TERM ACTIONS**

1. Amend Title 18A-Zoning, Title 18B-Signs, and Title 18J-Design Standards and Guidelines according to Land Use policies. (PALS)
2. Ensure the integrity of the Rural Separator (RSep) through: (PALS)
   - Land use designations, zoning, and development regulations;
   - Providing a transition between urban land and rural areas; and
   - Creating standards to promote compatibility with surrounding uses.
   - Prohibit urban uses and urban levels of service.
3. Consider amending Title 18A-Zoning to increase the maximum square footage of accessory dwelling units in the rural area to 1,300 square feet. (PALS)
**Mid-Term Actions**

1. Pursue opportunities for incentive programs that will stimulate revitalization and redevelopment projects that improve community aesthetics and services. (PALS)

**Long Term Actions**

1. Complete a monitoring report to evaluate growth trends to determine if planned densities are being achieved. (PALS)
2. Complete a monitoring report to evaluate the effectiveness of regulations and incentives. (PALS)
*Note: The legend shows only the land use designations within the Mid-County Community Plan Area. The areas outside this plan area are masked within the map display.
Chapter 3: Community Character and Design Element

INTRODUCTION

Community design deals with the physical elements that compose the character of our community: the streets, parks, buildings, open space, and neighborhoods all determine the way our community looks and feels. It is a blending of land use planning, architecture, landscape architecture, and environmental protection. Community design considers the way in which buildings, streets, public places, natural features, and other development relate to each other and the people who use them. Through community design, improvements such as street construction, park development, commercial, industrial, residential and civic development can be effectively coordinated with each other to promote a community image.

The Community Character and Design Element is a new addition to the set of documents comprising the Pierce County Comprehensive Plan. The element is an integral part of the entire growth management planning process for the Mid-County plan area. Design directly affects land use patterns, transportation planning, community and neighborhood livability, and overall quality of life. The design direction found in the community plan is intended to reinforce the aesthetic character that the community wants to retain and build upon. This element provides policies for site and building design which will enhance the image the community would like to portray to its own residents and visitors.

The Community Character and Design Element works with the Land Use Element by providing the policy direction for urban and rural design standards and guidelines. The design direction found is also closely linked with, and provides support for, policy direction in the Economic Element, Natural Environment Element, and the Facilities and Services Elements of the community plan.

Over time, the community has developed a sense of pride regarding the natural character of the Rural Separator designation and its connection to the Clover Creek drainage southward and the drainage northward via Swan Creek and Clear Creek. These features create a unique environment for community identity. Citizens have determined a high priority should be given to recognizing and
preserving the environmental character of the area. The Community Character and Design Element emphasizes the community’s vision by setting forth goals and objectives related to the preservation of the historic resources and natural characteristics of the area. The element also outlines policies for design standards that will help reinforce and preserve the unique environmental character of the area.

**DESCRIPTION OF CURRENT CONDITIONS**

Historically, the commercial portions of the plan area have developed absent a set of design standards. As a result, many of the buildings have standardized franchise themes or, in the case of independent businesses, some have no theme at all. Without question, the area has developed with incompatible architectural styles that lack consistent character.

The existing residential character is mostly comprised of larger platted properties throughout the Rural Separator with a significant amount of vegetative buffers within the area. Significant stands of trees still remain and coexist with areas that have been cleared and voided of understory vegetation for grazing and small scale agricultural practices. Within the Summit View portion of the plan area, there were no design standards required for residential development. The residential complexion of the area is largely single-family and duplex with high concentrations of multifamily in the Community Center area along the major arterials of Canyon and 112th Street East.

**DESCRIPTION OF DESIRED CONDITIONS**

The citizens of the Mid-County plan area want to keep their communities desirable places to live. Where appropriate, they would like to restore the character of the area by preserving historic resources throughout the area and blending natural features with the built environment. The Mid-County Community Plan accomplishes these goals through the use of design standards and other regulatory measures.

**COMMERCIAL AREAS**

One state highway and two major arterials traverse the Mid-County community, providing opportunities to create attractive entrances to the area. Plantings, signs, public art, and other features can be used to create aesthetically pleasing entrances and provide a sense of the community. Mid-County commercial areas will be well screened from fronting arterials when possible and enhanced with well designed architectural features to emphasize their character and unique sense of place.
NEIGHBORHOODS

Most of the Mid-County area, with the exception of the Summit View area, is within rural Pierce County and therefore not subject to increased residential use. Although the Summit View area is within the Urban Growth Area, much of the area is constrained with environmental features that will limit large scale residential development. When new residential areas are proposed they will have a diversity of housing types reflecting community identity, a small town atmosphere, and respect for the natural environment.

Neighborhoods will be characterized by houses that accentuate the living area of houses and de-emphasize carports and garages. Roadways will be separated from pedestrian and bicycle pathways so as to encourage a variety of modes of transportation. Streetscapes will be highlighted by trees and other plantings. Vehicular access points will be minimized. Residential areas will feature a variety of architectural features that minimize the scale of larger buildings so as to blend with the desired scale for the neighborhood. Natural features, such as wetlands, streams, and significant stands of trees, will be integrated into the site design for residential developments, thereby resulting in developed areas that complement the surrounding landscape.

DESIGN

A key to design in the Mid-County area will be to blend the natural and built environment to create areas that are functional, visually attractive, and compatible with the natural surroundings. This will occur in a number of ways:

- Uses within an area will blend through compatible design.
- Problems associated with potentially conflicting adjacent uses will be mitigated with a variety of site design and landscaping techniques.
- Attention will be given to assure a smooth transition between residential, commercial, industrial, and civic uses.
- Natural features and critical areas will be preserved and incorporated into site design.
- The apparent scale of large commercial and industrial buildings will be reduced through the design and placement of structures and through the effective use of landscaping.
- Pedestrian walkways will be separated from automobile circulation and located to provide ease of access between businesses and throughout neighborhoods.
- Building and site design will emphasize safety through effective use of lighting, site design, and landscaping.
- The appearance of streetscapes will be enhanced using attractive signs which provide information while blending with the surrounding area.
Impacts to the natural environment will be mitigated through the application of site inventory and analysis requirements and environmentally sensitive design standards.

**Signs**

The community plan sets new standards for signs as a means of enhancing the streetscape of Canyon Road and 112th Street East. Policies and regulations strive to reduce the number and size of signs. In commercial complexes with multiple businesses, signs will be consolidated to diminish the visual clutter. New pole signs will be prohibited and monument signs encouraged.

**Historic Resources**

The residents of the Mid-County area recognize the importance of preserving historic resources. To ensure that the historic character and features of the area are maintained, redevelopment and renovation of historic structures will occur so as to preserve the integrity of those structures. Productive and attractive uses of historic buildings will be encouraged while new developments will be consistent with historic sites and structures.

**Design and Character Policies**

**Goals**

Ensure a high quality visual environment through design, guidelines, standards, and procedures for architectural, site, and landscape design in all public and private development.

**Community Entries and Streetscapes**

**Goal MC D-1**

Provide design concepts and policies that will create attractive, easily identifiable community entrances and streetscapes within each area that comprises the plan area: Summit-Waller, Summit View, and North Clover Creek Collins communities.

**MC D-1.1**

Create identifiable boundaries, entries, gateways, and other visual cues so that residents, workers, and visitors know they are entering the communities which comprise the Mid-County plan area.

**MC D-1.2**

Provide distinctive designs at the edges, entrances, and other key locations within the community.

**MC D-1.3**

Use a variety of measures to create distinctive entrances, e.g., landscaping, tree planting, graphics, signage, lighting, monuments, pavement treatment, and public art.
Community entries consisting of tree plantings, signage, or public art shall be established to create a gateway effect and recognize individual communities.

The entries should recognize reasonable gateway points into the community. Locations to consider include:

- Canyon Road East at Pioneer Way (Summit-Waller);
- Waller Road at Pioneer Way (Summit-Waller);
- 112th Street East at Woodland Avenue (Summit-View);
- 72nd Street East in the vicinity of Swan Creek (Summit-Waller);
- Golden Given Rd. at Brookdale Road (North Clover Creek Collins);
- 112th Street East and Golden Given Road (North Clover Creek); and
- Canyon Road East and 128th St. E. (NCCC and Summit View).

Pierce County shall support and assist the communities in developing and maintaining entrances.

Support and assistance may be in the form of grant writing, developing a landscaping plan, working with the business community, and other methods to solicit interest in the development of the entrances.

Require the planting of street trees and other vegetation along all arterial roadways within the community.

Pierce County, in conjunction with business organizations, community groups, and property owners, shall develop street tree management programs. Such programs shall focus on maintenance and enforcement.

Develop detailed streetscape plans addressing streets, crosswalks, sidewalks, signage, landscaping, street furniture, utilities, public spaces, etc.

Establish specific and consistent design standards for commercial areas along the 112th Street and Canyon Road corridors.

Develop a standard streetscape design for Canyon Road East and 112th Street East.

Vegetative screening for aesthetics, noise abatement, screening of light sources, and air quality shall be established between development and SR 512.

The depth of screening buffers shall be determined by evaluating the quality and quantity of natural vegetation that is available on the site together with intensity of the proposed use. In no case shall the screen buffer be less than 40 feet wide.

Areas proposed for SR 512 buffering that are devoid or deficient in vegetation shall be planted with appropriate quality and quantity of plantings to produce a complete visual corridor within five years of project approval.
MC D-3.5  Encourage the Washington State Department of Transportation and Pierce County to manage and replant any forested areas within their control along SR 512 so as to maintain a complete visual screen along this highway.

MC D-3.6  Require dense vegetative screening between new developments when abutting SR 512.

MC D-3.7  Establish a visual corridor along SR 512 which reflects the rural characteristics of the plan area.

### Rural Character

**Goal MC D-4**  Natural vegetation should be required as a component of all new rural developments.

**MC D-4.1**  Existing native vegetation consisting of mature trees and understory shrubbery should be retained and incorporated into the site plan on a portion of each property that is planned for rural development.

**MC D-4.2**  Sites that are devoid or deficient in natural vegetation shall be required to introduce supplemental plantings that are native to the Pacific Northwest.

**MC D-4.3**  Areas that are deemed unsuitable for development based on soil with poor drainage characteristics, wetlands, geologic, or other critical areas are priorities for open space and similar uses.

### Commercial and Industrial Character

**Goal MC D-5**  Develop commercial and industrial requirements dealing with site design, building design, landscape design, and sign design and placement.

**MC D-5.1**  Use fencing and landscaping to conceal outside storage and sales areas.

**MC D-5.2**  Integrate water quality treatment techniques such as biofiltration swales and ponds with overall site design, where appropriate.

**MC D-5.3**  Architectural and site design of non-residential, commercial developments should be required on developments that cannot be adequately screened from the traveled way.

**MC D-5.3.1**  Discourage nondescript architecture that has few design features, cohesiveness, or is scaled to be appreciated at automobile speeds.

**MC D-5.3.2**  Reduce the apparent scale of large commercial structures located adjacent to residential neighborhoods and uses through building placement, design, and landscaping.

**MC D-5.3.3**  Enhance building entries with a combination of weather protection, landscaping, pedestrian amenities, or distinctive architectural features.

**MC D-5.3.4**  Locate or screen roof-mounted mechanical equipment to minimize visibility from public streets, building approaches, and adjacent properties.
MC D-5.3.5 Locate or screen utility meters, electrical conduit, and other utility equipment to minimize visibility from the street.

GOAL MC D-6 Site and building design requirements within the Community Employment zone should focus primarily on ensuring appropriate transitions to non-industrial areas and public roadways.

MC D-6.1 Industrial uses should provide substantial landscaped areas when adjacent to residentially zoned areas and public roadways.

GOAL MC D-7 Within rural areas, ensure a high quality visual environment through design guidelines, regulatory standards, and volunteer efforts.

MC D-7.1 Comprehensive site planning, retention of native vegetation, and open space dedications are goals for all rural developments.

MC D-7.2 Preservation of a rural architectural theme shall be utilized in new building construction or the external alteration of existing structures.

MC D-7.3 Encourage site characteristics that enhance historical commercial centers.

**Urban Residential**

GOAL MC D-8 Promote the development of well-designed urban residential areas.

MC D-8.1 Enhance the visual quality of neighborhood streetscapes so that they become a valued element of the character of the community.

MC D-8.2 Encourage use of curvilinear streets and narrower street profiles within residential neighborhoods.

MC D-8.3 Encourage underground stormwater retention systems by providing development incentives.

MC D-8.4 Avoid locating parking areas for multifamily developments between the buildings and the street.

**Landscape Design**

GOAL MC D-9 Use creative landscaping to calm traffic, attractively screen service areas, minimize the impact of parking lots, and revitalize the natural environment.

MC D-9.1 Require a landscaped area between the traveled way and the sidewalk that includes elements such as mature trees that provide a visual buffer.

MC D-9.1.1 Landscaping shall not inhibit driver sight distance or visibility.

MC D-9.2 Newly planted landscaped strips shall contain trees that are at least 6 feet tall and 1.5 inches caliper size.

MC D-9.2.1 Trees must be a minimum of 20 feet at maturity, except where conflicts occur with utility corridors.
MC D-9.3 Trees that serve to assist in noise reduction for commercial or industrial properties shall consist primarily of evergreen.

MC D-9.4 Landscape Canyon Road East and 112th Street East with trees and lush green areas along its edges.

MC D-9.4.1 New plantings should be at least 6 feet in height and 1.5 inches caliper size and capable of a minimum height of 20 feet at maturity.

MC D-9.5 Encourage the use of bioretention swales in parking lot landscaped areas to break up the expanse of asphalt and assist in stormwater treatment and infiltration.

MC D-9.6 Parking lot landscaping shall be significant and near the traveled way to provide maximum screening.

MC D-9.7 Parking lot vegetation should consist of a variety of trees and vegetation.

MC D-9.7.1 New trees should be at least 6 feet in height and 1.5 inches caliper size and capable of a minimum height of 20 feet at maturity, except where conflicts with utility corridors would occur.

MC D-9.8 Vegetation that is native to the Pacific Northwest and that is drought tolerant is preferred for landscaping.

MC D-9.9 Increase the amount for the landscaping bond that is required prior to final plat approval to ensure developments are built-out with the required landscaping.

MC D-9.9.1 The increase of the bond shall cover the potential overhead costs that Pierce County may experience in the employment of a third party to plant the required landscaping.

MC D-9.10 Encourage landscaping that consists of native vegetation that will soften the appearance of new uses from adjacent rural lands.

**SIGN DESIGN**

**GOAL MC D-10** Ensure that the design and placement of signs is consistent with the Mid-County design standards and guidelines.

MC D-10.1 No new billboards shall be permitted.

MC D-10.2 Pursue nuisance abatement to eliminate problems that inhibit the goals of the districts and the community.

MC D-10.3 Ensure that temporary signs are promptly removed after the culmination of the event described or symbolized on the sign.

**GOAL MC D-11** Ensure that signs complement, rather than dominate or intrude upon, the character and visual amenity of an area, the buildings on which they are displayed, and the general environment.

MC D-11.1 Prohibit the use of flashing or rotating signs, video signs, roof signs, trailing signs, inflatable signs, and signs attached to private light standards.
MC D-11.2 Prohibit signs that result in glare onto adjacent properties.
MC D-11.3 Prohibit new pole signs on individual commercial properties.
MC D-11.4 Encourage monument and wall signs.
MC D-11.5 Require consolidation of signage within commercial development to reduce visual clutter along streets and the freeway.
MC D-11.6 Prohibit off-site advertising signs and billboards in the rural area, except signs related to agricultural crop sales and civic uses.
MC D-11.7 Prepare standards that limit total sign area to a proportion of the length of the building façade.
MC D-11.8 Permit signs throughout the rural area that increase public awareness of local farms and other habitat areas.
   MC D-11.8.1 These signs could explain the type of crops being raised or that a best management plan is being utilized.
   MC D-11.8.2 These signs shall not exceed 2 square feet and shall consist of a single, distinct design and color for the plan area.
MC D-11.9 Minimize the use of off-premise signs.
   MC D-11.9.1 Inventory existing billboards and do not allow new billboards without removal of existing.
   MC D-11.9.2 Existing billboards should be eliminated over time through use of an amortization period.
MC D-11.10 Enable individuals, businesses, and community groups to promote temporary activities to the wider community through the adoption of clear regulations governing the use, size, and allowed duration of temporary signs.
   MC D-11.10.1 Banners should be of a style, size, and color that complement the surrounding environment and standard on which they are affixed.
   MC D-11.10.2 Banners must be promoting primarily the community events and farmer’s markets where they are displayed.
   MC D-11.10.2.1 Specific advertising of businesses or merchandise is prohibited.
MC D-11.10.3 Temporary signs that are attached to a permanent structure, such as on private light standards, shall be prohibited.
MC D-11.10.4 Prohibit temporary signs that are affixed to a utility pole unless expressly reviewed and approved by the utility provider.

**Lighting Design**

**GOAL MC D-12** Provide lighting that is integrated with the overall architectural concept in scale, detailing, use of color and materials, and placement.
MC D-12.1 Integrate the design and placement of exterior lighting with the architectural design and materials of on-site buildings, overall site character, and surrounding neighborhood.

GOAL MC D-13 School bus stops should be lit and safe.

MC D-13.1 The school district should plan the stops and developments should contribute to construction and safety.

GOAL MC D-14 Encourage parking area lights to be greater in number, lower in height, and lower in light level, as opposed to fewer in number, higher in height, and higher in light level.

MC D-14.1 Parking lot lighting shall not exceed Illuminating Engineering Society of North America (IESNA) recommended lumens.

GOAL MC D-15 Reduce the amount of lighting and glare onto adjacent sites and roads.

MC D-15.1 Establish standards that curtail lighting and glare from intruding onto adjacent properties and into the night sky. Lighting standards shall provide a ceiling for all developments. Developments may deviate from the standard only when it can be demonstrated the extra lighting is necessary and impacts onto adjacent properties, roads, and the night sky will be minimized.

MC D-15.2 Artificial light from commercial businesses and signs shall not be directed into the night sky, toward the road, or toward neighboring properties.

IMPLEMENTING ACTIONS

The following list of actions needs to be completed in order to implement the policies contained within this plan. They are arranged according to the timeframe within which each should be completed: short, medium, or long term. Short-term actions should occur within one year of plan adoption. Mid-term actions should be completed within 2-5 years. Long-term actions should be completed within 5-10 years of plan adoption. The entity or entities responsible for leading the effort to complete the action item is listed in parenthesis following the action. Actions are assigned to the Mid-County Land Use Advisory Commission (LUAC), Pierce County Planning and Land Services (PALS), Pierce County Economic Development (ED), Pierce County Parks and Recreation (Parks), Pierce County Public Works & Utilities (PWU), and Tacoma-Pierce County Health Department (TPCHD).

SHORT TERM ACTIONS

1. Adopt development regulations to establish minimum setbacks and height standards for all zone classifications; (PALS)
2. Amend Title 18J-Design Standards and Guidelines (PALS)
   • Develop a standard streetscape design for Canyon Road East and 112th Street East;
   • Develop provisions for street trees, other vegetation, or landscaped areas along all arterial roadways;
• Establish urban and rural design standards and guidelines for:
  • Commercial and industrial uses dealing with site design, building design and placement, landscaping, lighting, and circulation.
  • Multifamily residential development dealing with site planning, building placement, and building scale.
• Establish a range of open space dedication requirements based upon the density or intensity of the proposed use;
• Require landscaping buffers to separate dissimilar or incompatible uses.

3. Amend Title 18B-Signs (PALS)
   • Control the size, type, design, and location of signs;
   • Implement uniform and balanced requirements for new signs and an amortization schedule for the removal of signs made nonconforming with the new regulations;
   • Apply design standards and guidelines to the design and placement of signs within the community;
   • Allow temporary signs that are controlled by the use, size, and duration of the sign.

**Mid-Term Actions**

1. Work toward the creation of community entrances and streetscapes at identified locations through the use of design concepts and standards. (PALS, LUAC)
2. Develop a street tree management program. (PALS, LUAC)
3. Increase the amount for the landscaping bond that is required prior to final plat approval. (PALS)
4. Inventory existing billboards within the plan area. (PALS)
Chapter 4: Natural Environment Element

**INTRODUCTION**

The Natural Environment element addresses the protection and conservation of natural resources in the Mid-County community such as air, water, vegetation, and fish and wildlife. The residents of the Mid-County community are concerned about maintaining the quality of riparian zones and the natural hydrologic functions within the plan area. Most importantly the community wants to ensure that development practices respect the integrity of the natural environment.

Of great importance to the community is the long-term protection of the community’s ground and surface water systems. The community would like to employ strategies that ensure growth and development will not contribute to the degradation of the ground and surface water systems or increase flooding events. The plan area is within the Clear/Clarks Creek and Clover Creek Basin Plan areas. These drainage areas include several creeks within the plan area that all drain to the Puyallup River in the northern portion of the plan area: Swan, Canyon, Squally, Woodland, Diru, and Rody creeks as well as several unnamed creeks. These creeks are significant natural features in the community and provide essential habitat to a variety of fish and wildlife species. The Puyallup River and Clark and Clear Creeks are all salmon bearing. The Puyallup River and Clear Creek are designated as Shorelines of the State. Continued development activities in the community pose a significant threat to the health of the drainage basins. Ensuring the Clear Creek, Clark Creek, and Clover Creek drainage basins are adequately protected as the community grows is a key component of the community plan.

Another area of concern to the community is the retention and restoration of native vegetation and soils in order to preserve significant tree cover, reduce flooding, prevent soil erosion and sedimentation, and to absorb and infiltrate water. The trees and vegetation of the Pacific Northwest offer valuable habitat to wildlife while providing the human environment with visual relief, shade, noise barriers, and an opportunity for integration of the earth’s natural resources. It is estimated that in 1972, 45% of the plan area was considered as having heavy tree cover (areas with more than 50% tree canopy cover). By 1996, as a result of a land clearing and development activities, less than 12% of the plan area was considered heavily forested. The same study indicated that in 1996, approximately 83% of the plan area was considered having little or no tree canopy cover. Reducing future tree loss in the community is another component of the Mid-County Community Plan.

Conservation of open space is also a high priority of the community. The community desires to develop an open space network that will provide a system of open space corridors along streams and within areas heavily constrained by environmentally sensitive features.
community plan identifies high value open space areas and encourages public and private acquisition of these areas for long term preservation.

The community plan also recognizes and seeks to protect the quality of several other important environmental attributes including native fish and wildlife habitat, air quality and noise levels. Policies and implementing regulations set forth in the community plan contain variety of strategies addressing these areas.

**DESCRIPTION OF CURRENT CONDITIONS**

**EARTH RESOURCES**

**SOILS**

Soil types determine the ability of the ground to absorb rainfall. Soil types have been classified into hydrologic soil groups that represent varying degrees of water runoff potential: Group A (low runoff potential), Group B (low to moderate runoff potential), Group C (moderate to high runoff potential), and Group D (high runoff potential).

According to the Pierce County Soil Survey, there are a variety of soils that occur within the plan area. The major soils types within the Mid-County plan area consist of Group C and Group D soils. These soil types have slow infiltration rates and may indicate a high water table or wetlands. Group D soils having high water runoff potential are located west of Vickery Ave, south of SR 512 and within the north/south ravines draining towards the Puyallup River.

**VEGETATION**

The historic plant communities within the plan area were conifer woodlands with a very limited amount of prairie and savannah. The prairies (grasslands) and savannahs (grasslands with sporadic tree cover) were supported by the Spanaway gravelly sand loam soil in the southern portion of the plan area. The plan area currently contains several large stands of mixed woodlands including deciduous trees (alder and maple) and conifers (Douglas fir, hemlock and cedar). Other significant tree species within the plan area worth noting are the Garry (Oregon white) oak, Pacific yew, Pacific madrone, and the Ponderosa pine. These species tend to be slow-growing and susceptible to impacts from adjacent development. Understory brush is typically dominated by elderberry, Oregon grape, bracken fern, and sword fern.

**TOPOGRAPHY**

The plan area consists of relatively flat uplands with slopes of 20% or less and deep gorges of three creeks that flow north into the Puyallup River. These long, narrow gorges contain slopes with grades that exceed 40%. Areas with slopes of 20% or greater total approximately 700
acres or 4% of the total plan area and are considered potential landslide or erosion hazard areas. Development within these areas is controlled by Pierce County’s Critical Area Regulations, Title 18E. These regulations generally require that these slopes remain in an undisturbed condition and that development be setback a certain distance from these hazard areas. Geology in the area was heavily influenced by the Vashon Glaciation, which ended about 13,500 years ago. Vashon Age deposits cover most of the plan area and account for the soil characteristics and the presence of gravel resources.

### Potential Seismic Hazard Areas

Approximately 11% (1,677 acres) of the plan area is categorized as potential seismic hazard areas. The majority of this land is located in the northern portion of the plan area along the Puyallup River. Several small areas are scattered throughout the plan area.

Potential seismic hazard areas are areas subject to severe risk of damage as a result of earthquake induced ground shaking, slope failure, settlement, or soil liquefaction. Seismic hazard areas are noted by the presence of alluvial surficial geology or recessional outwash geology overlain by Barneston, Everett, Neilton, Pilchuck, or Spanaway soils.

New land use activities within seismic hazard areas are subject to more stringent engineering requirements, including the submittal of geotechnical reports that may include recommendations for mitigation measures to be taken to reduce the risk of structural damage from a seismic event. Single-family homes less than 5,000 square feet in size and subdivision of property are exempt from the geotechnical reporting requirements.

### Water Resources

(Source: Flood Insurance Rate Maps, FEMA; National Wetland Inventory; Pierce Co. Wetlands Inventory; WDFW Streamnet; and Groundwater Pollution Potential (DRASTIC) maps, 1998; Pierce County Planning and Land Services)

### Surface Waters

The Mid-County Community Plan area includes portions of three significant drainage basins. These basins contain the major streams that drain the plan area including Clear Creek, Clarks Creek, and Clover Creek. The Clear Creek basin is approximately 8,600 acres. The creeks that drain into Clear Creek include the east and west fork of Clear Creek, Canyon Creek, Squally Creek, and Swan Creek. The western portion of the Clarks Creek basin is located in the plan area and contains approximately 2,000 acres. The three major creeks that drain into Clarks Creek are Woodland Creek, Diru Creek and Rody Creek. Both Clear Creek and Clarks Creek flow directly into the
Puyallup River. The southern 1/4 of the plan area drains into Clover Creek. The north fork of Clover Creek is the major stream in the southern portion of the plan area. The area of the Clover Creek basin located within the Mid-County Community Plan area is approximately 4,700 acres.

The streams within the Clear Creek and Clarks Creek basins flow from the south to the north and can be divided into three sections. The upper, southerly sections of these streams follow a fairly low gradient profile often in roadside ditches across the plateau. The middle sections of these streams are located in steep, deeply entrenched ravines with actively down-cutting channels. The lower sections of the streams are located in the floodplain of the Puyallup River and are low gradient and channelized. The upper sections of these streams contain little or no surface flow from late May through September.

The streams within the plan area that run into Clover Creek flow from the north to the south and include the North Fork of Clover Creek as well as two unnamed minor streams (described in the Clover Creek Basin Plan as Clover Creek tributary number 2 and Clover Creek tributary number 3). The North Fork of Clover Creek with its six tributaries is the most significant tributary to Clover Creek. It flows through relatively flat topography including a series of County drainage ditches before draining through a steep ravine to the Clover Creek valley at Brookdale Road. Clover Creek tributary number 2 originates near 144th Street and Vickery Ave and surface flows into Clover Creek near 150th Street Ct E. This tributary typically dries out between storm events. Clover Creek tributary number 3 drains into the Brookdale Pit; however it may emerge in springs outside of the plan area near 152nd Street E.

**POTENTIAL FLOOD HAZARD AREAS**

The plan area is dominated by a layer of compacted glacial till near the surface. Low-permeability hardpan soils tend to inhibit the earth’s ability to absorb rainfall. This results in high levels of surface water runoff which leads to flooding following significant storm events. There is a potential for flooding along each of the creeks and within the low lying areas on the upper plateau. The flooding of the upper plateau generally occurs where creeks or drainage ditches pass through culverts or where wetlands once existed adjacent to creeks. The removal of the forest cover in the riparian areas next to creeks along with an increase in impervious surfaces have increased the volume of stormwater runoff and shortened the length of time it takes runoff to reach streams. This results in increased velocity and volume of peak flows. These rapid increases of flow contain contaminants that wash into the streams from surrounding land uses. Further, these storm event flows tend to scour stream channels which result in damage to fish habitat. Flooding can also occur in the floodplain adjacent to the Puyallup River. Flooding on the Puyallup River is typically associated with regional weather events outside the plan area such as rapid snowmelt and heavy rain in the upper Puyallup watershed. The River Road levee protects the land within the Puyallup River floodplain from all but the largest mainstem floods.
Wetlands

Wetlands are areas that are inundated or saturated by surface water or groundwater at a frequency and duration sufficient to support a prevalence of vegetation typically adapted to life in saturated soil conditions. Examples of wetlands include swamps, marshes, bogs, and similar areas. Wetlands are of significant biological and physical value and are required to be protected under federal, state, and local laws. Pierce County uses the National Wetlands Inventory (NWI), Pierce County Wetlands Inventory (CWI), and site specific investigations to determine the presence of wetlands. It should be noted that the CWI and NWI maps are not entirely complete and that there may be small wetland areas throughout the community that are not noted in these inventories.

Wetlands in Pierce County are classified and protected according to category. Category I wetlands are the most valuable wetland systems and are typically large, diverse wetlands which provide habitat for threatened or endangered species. Category II wetlands are typically large, diverse systems that provide significant habitat. Category IV wetlands are the least valuable, and are hydrologically isolated, less than one acre in size, and have only one dominant plant species. Category III wetlands are wetlands that do not meet the criteria of Category I, II, or IV. Most wetlands in Pierce County fall into either Category II or III.

The CWI indicates that there are 1,211 acres of wetlands in the plan area. Approximately 8% of the plan area is classified as wetland. Although wetlands existing in various locations throughout the plan area several extensive areas of wetlands have been documented. The most significant area is located within the Summit View community. Wetlands within the Summit View community tend to follow a north/south alignment. A second area of extensive wetlands is associated with the north fork of Clover Creek and its tributaries. The final location that contains significant wetlands includes the riparian corridor associated with Clear Creek along Pioneer Way. These areas of extensive wetlands typically contain Group D, hydrologic soils that contain a significant amount of clay near the surface.

Groundwater

Most residents of the Mid County area rely on groundwater as their potable water source. Based on the soil conditions in the region, much of the plan area is regulated as an aquifer recharge area. Aquifer recharge areas are those locations that have a critical recharging effect on groundwater used for potable water supply or land that demonstrates a high level of susceptibility to groundwater contamination. Pierce County regulates aquifer recharge areas based on three criteria. These are Wellhead Protection Areas, the two highest DRASTIC zones (rates 180 or higher), and areas within the Clover/Chambers Creek Basin Boundary. Generally, the property within the Puyallup River floodplain located north of Pioneer Way as well as the southern 1/2 of the plan area is within highest DRASTIC Zones. The Clover/Chambers Creek Aquifer includes all property within the Clover Creek Watershed. Various Wellhead Protection Areas are located at point locations throughout the plan area. It is the intent of the aquifer recharge standards to protect groundwater that is vulnerable to contamination by mitigating or precluding discharges of contaminants from new land uses.
FISH AND WILDLIFE HABITAT
(Source: WDFW PHS Digital Database)

PRIORITY HABITAT SPECIES

Priority fish and wildlife habitat and species locations have been mapped by the Washington State Department of Fish and Wildlife (WDFW) and are identified in WDFW’s Priority Habitat and Species Database. These locations are associated with streams, wetland areas, and areas of relatively undisturbed vegetation. A majority of these areas are located along Swan, Clear, and Clover Creeks and the wetland areas located in Summit View. A Chinook presence is known on the Puyallup River, Clear Creek, and Clarks Creek.

Four wildlife locations are found within the plan area. Wildlife locations may include a bald eagle, peregrine falcon, great blue heron, Western pond turtle and/or reticulate sculpin. A wide variety of birds are found in the area, including hawks, hummingbirds, wrens, sparrows, and finches. Commonly found mammals include black tailed deer, raccoon, and Washington hare.

AIR QUALITY

The Puget Sound air shed is influenced by the Olympic and Cascade mountain ranges, the Pacific Ocean, and weather conditions. Air flows enter the central Puget Sound region via the Strait of Juan de Fuca to the north and the Chehalis Gap to the south. Onshore winds can effectively serve to mix and disperse air pollutants. When onshore air flow is interrupted air can become inverted and stagnate which traps air pollutants between the mountain ranges.

The Washington State Department of Ecology and the Puget Sound Clean Air Agency monitor air quality in the Puget Sound Area. In Pierce County, air quality monitoring stations are located at Milton, Tacoma Tideflats, south of Puyallup, Eatonville, and Mount Rainier. These stations track numerous air pollutants including particulate matter, carbon monoxide, ozone, nitrogen dioxide, sulfur dioxide, and lead. The sources of these pollutants include motor vehicles, industrial emissions, residential woodstoves and fireplaces, outdoor burning, and other sources. Of these sources, motor vehicles are the largest source of pollutants, generating an estimated 55% of all air borne pollutants in Washington State. Air quality standards are established by the Environmental Protection Agency (EPA) and Washington State. Failure to meet the established standards results in an area being designated as a “nonattainment area” by the EPA and a plan is required to be developed to bring the area back into compliance with the established standards. When a nonattainment area has met the established standards, the area is identified as “maintenance” area and is redesignated to attainment provided they can maintain the established standards for ten consecutive years. The most recently published air quality report for the Puget Sound Region is for the years 2000-2002 and was released by the Department of Ecology in April 2003. This report indicates that the air quality of the Puget
Sound region, including Pierce County, is in compliance with established standards. The Puget Sound is identified as a carbon monoxide and ozone maintenance area and the Tacoma Tideflats is identified as a particulate matter maintenance area. The trend in air quality over the past ten years in the Puget Sound region has been one of continuing improvement.

**DESCRIPTION OF DESIRED CONDITIONS**

The Mid-County communities assign a high value to the vegetation, streams, and other natural areas within its boundaries. These natural areas contribute to the quality of life experienced by the community and are important aspects of the communities’ identity. Like many communities in Pierce County, residents of Mid-County have seen degradation of the natural environment over the past 30 years of growth. The development pattern and environmental degradation is expected to lessen, but the communities realize that action must be taken to ensure the integrity of the natural environment is preserved for present and future generations.

**EARTH RESOURCES**

The protection of soils and natural vegetation is a priority of the Mid-County communities. Education is a key element to the protection of these resources and will move the community toward awareness of illegal and harmful acts such as clearing and grading. The community recognizes the importance of holding one another accountable for the destruction of the natural environment. In addition, it is imperative that more innovative techniques be utilized when developing environmentally sensitive areas. The consideration of certain soil types for low-impact development has been identified as an important step for this plan area, as the majority of the plan area is made up of soil types C and D, which are very sensitive. As development continues in the plan area, a network of open space corridors ought to be created, especially as buffers to sensitive areas.

**WATER RESOURCES**

The protection of aquifer recharge areas, protection of the various streams and wetlands, and mitigation of flood hazards is major concern in the plan area. Protection requires educating the public of human impacts on water resources. Pollution reduction in the many streams in the plan area has been identified as a priority. A goal is to work with local groups, such as Washington State University – Pierce County Extension and Pierce Conservation District, to educate the public of responsible disposal techniques of various pollutants to protect valuable streams and wetlands. A major aquifer recharge area exists within the plan area, providing some of the region’s potable water source, which the community has identified as a priority for protection. The reduction of overall development and implementation of low-impact development standards in critical areas, such as wetlands and flood hazard areas, is a primary goal of the community.
FISH AND WILDLIFE HABITAT

Extensive fish and wildlife habitat exists within the plan area. The community will pursue educational opportunities and provide information which will encourage the protection of these invaluable species. A major part of the retention of these habitat areas is removal of invasive species and obstructions to wildlife corridors, whether fences or barriers in streams. The linkage of wildlife corridors throughout the plan area, the County, and the region would provide habitat connectivity which benefits individual species.

AIR QUALITY

The community is committed to the implementation and support of local, regional, national, and international air quality standards in order to improve the quality of life and health of the region.

ENVIRONMENT POLICIES

GOALS

Preserve natural resources and amenities and ensure environmental quality throughout the Mid-County Community Plan area.

GENERAL

GOAL MC ENV-1 Improve enforcement of illegal clearing and grading activities in the community.

MC ENV-1.1 Increase public awareness of Pierce County’s Code Enforcement Division.

MC ENV-1.1.1 Disseminate contact information for Code Enforcement to promote opportunities for the general public to report violations of environmental regulations.

MC ENV-1.2 Create a method of addressing violations on the weekends.

EARTH RESOURCES

GOAL MC ENV-2 Reduce the visual, noise, and lighting impacts of incompatible uses on neighboring properties through adequate size and density of vegetation within required buffers.

GOAL MC ENV-3 Comply with minimum development standards for the conservation and restoration of wooded areas and tree canopy cover within the plan area to preserve the functions of the natural environment.

MC ENV-3.1 Require the development of sites that contain too few trees to meet the minimum tree conservation standards.

MC ENV-3.1.1 Provide supplemental trees as necessary to achieve the standards.
MC ENV-3.2 Construction of a detached single-family residence on an existing lot shall be exempt from tree conservation standards.

MC ENV-3.3 Ensure trees selected for planting are compatible with the natural and built features of the site.

MC ENV-3.3.1 Emphasize the use of native tree species, whenever feasible.

MC ENV-3.4 Development proposed on sites with Group D soils shall require an increase in the number of trees per acre as a ratio to total impervious surfaces.

GOAL MC ENV-4 Remove invasive plant species (e.g., Scot’s broom, tansy ragwort, and reed canary grass, etc.) and when possible, restore with native plants.

MC ENV-4.1 Enforce current regulations for tansy removal.

MC ENV-4.2 Allow the clearing and removal of dangerous or diseased trees and other vegetation such as Himalayan and evergreen blackberry.

**WATER RESOURCES**

GOAL MC ENV-5 Reduce the reliance on traditional conveyance and pond technologies to manage stormwater quality and quantity.

MC ENV-5.1 Comply with development standards that allow low impact development techniques for controlling stormwater such as:

**MC ENV-5.1.1** Maximize retention of native vegetation and tree cover to intercept, evaporate, and transpire precipitation;

**MC ENV-5.1.2** Assess the site’s soils, current and native vegetation cover, wetland areas, streams, ponds, and other critical areas. Establish buffers and delineate protected areas;

**MC ENV-5.1.3** Preserve permeable, native soils and restore disturbed soils with compost and other amendments to infiltrate and store stormwater;

**MC ENV-5.1.4** Retain and incorporate topographic site features that promote infiltration and storage of stormwater;

**MC ENV-5.1.5** Direct the location of buildings and roads away from critical areas and soils that can effectively infiltrate stormwater;

**MC ENV-5.1.6** Minimize building footprints, and road widths and lengths to reduce impervious surfaces;

**MC ENV-5.1.7** Reduce effective impervious surfaces;

**MC ENV-5.1.8** Utilize permeable surfaces (e.g., pervious pavement, pavers, and gravel systems) where possible to promote stormwater infiltration;

**MC ENV-5.1.9** Utilize small, decentralized bioretention areas with appropriate vegetation to infiltrate, store, and transpire precipitation; and
MC ENV-5.1.10  Manage stormwater as close to its origin as possible.

MC ENV-5.2  Implementation of low impact development techniques is a community priority and encouraged; however, the standards are intended to remain voluntary.

GOAL MC ENV-6  Preserve and protect the function and value of drainage courses.

MC ENV-6.1  Protect creeks and their gorges through control of runoff and erosion.

MC ENV-6.2  Discourage intensive development along the riparian corridors in the community, including Swan Creek.

MC ENV-6.3  Inventory all drainage ditches within the community and consider unique regulatory standards that recognize the diversity of functions provided by these facilities.

GOAL MC ENV-7  Consider the development of a wetland banking program. Use funds for the purchase and restoration of important wetlands.

MC ENV-7.1  Use all funds collected as mitigation for projects located within the plan area to purchase and restore wetlands within the plan area.

MC ENV-7.2  Provide additional protection of mosaic wetland systems that are hydrologically connected.

GOAL MC ENV-8  Encourage property owners to voluntarily provide fencing to keep animals out of streams.

FISH AND WILDLIFE RESOURCES

GOAL MC ENV-9  Protect native fish and wildlife species through protecting habitat and by removing barriers that restrict movement of fish and wildlife species.

MC ENV-9.1  Retain sufficient natural buffers near creeks, wetlands, and other environmentally sensitive areas to preserve fish and wildlife habitat, and protect such areas from erosion and sedimentation.

MC ENV-9.1.1  Make buffers continuous where possible to provide a corridor for movement of wildlife.

MC ENV-9.2  Minimize the amount of clearing and grading that is allowed within designated fish and wildlife habitat areas.

MC ENV-9.3  Coordinate ditch maintenance activities and streamside restoration with the drainage districts to promote best management practices.

MC ENV-9.4  Require the elimination of fish barriers when constructing or reconstructing all roads.

MC ENV-9.5  Prioritize stream restoration projects based on the stream’s likelihood of providing a sustainable fishery resource. Restoration projects to consider include:
**MC ENV-9.5.1** County reclaimed gravel pit on 50th Street East and Waller Road adjacent to Swan Creek;

**MC ENV-9.5.2** Current projects along Swan, Clover, and Clear creeks; and

**MC ENV-9.5.3** Place a higher priority for stream restoration projects and property acquisition efforts intended to benefit fisheries along those stream reaches nearest the Puyallup River.

**MC ENV-9.6** Enhance movement along streams and creeks by decreasing the amount of fences that obstruct lineal passage in and along the riparian corridor.

**MC ENV-9.7** Encourage buffers within designated open space corridors which could provide wildlife habitat.

### OPEN SPACE

**GOAL MC ENV-10** Develop an open space network that provides the community with a system of open space corridors along streams and within areas heavily constrained by environmentally sensitive features.

**MC ENV-10.1** Provide connections between open space corridors in those areas that contain environmentally constrained land.

**MC ENV-10.2** Provide connections between open space corridors in those areas that provide opportunities for wildlife movement.

**MC ENV-10.3** Look for opportunities to permanently protect or acquire environmentally constrained land within open space corridors.

**MC ENV-10.4** Support Pierce County efforts to acquire frequently flooded areas within open space corridors.

**MC ENV-10.5** Utilize open space areas to retain or restore fish and wildlife habitat when appropriate.

**MC ENV-10.6** Consider the application of Low Impact Development (LID) techniques in open space areas that contain appropriate soil types that can accommodate these construction methods.

### IMPLEMENTING ACTIONS

The following list of actions needs to be completed in order to implement the policies contained within this plan. They are arranged according to the timeframe within which each should be completed: short, medium, or long term. Short-term actions should occur within one year of plan adoption. Mid-term actions should be completed within 2-5 years. Long-term actions should be completed within 5-10 years of plan adoption. The entity or entities responsible for leading the effort to complete the action item is listed in parenthesis following the action. Actions are assigned to the Mid-County Land Use Advisory Commission (LUAC), Pierce County Planning and Land Services (PALS), Pierce County Economic Development (ED),

Pierce County Comprehensive Plan | Mid-County Community Plan
Pierce County Parks and Recreations (Parks), Pierce County Public Works & Utilities (PWU), and Tacoma-Pierce County Health Department (TPCHD).

**SHORT TERM ACTIONS**

1. Amend Title 18A to rezone urban areas that contain or are adjacent to designated riparian corridors and other significant habitat areas with resource based zones. (PALS)
2. Amendment Title 18J to include standards that address intensity of land uses, lighting and noise controls. (PALS)
3. Modify the Comprehensive Plan Open Space Corridor Map to include additional properties as specified in the plan policies. (PALS)
4. Support the Pierce Conservation District in their efforts to help property owners develop farm management plans. (PALS)

**MID-TERM ACTIONS**

1. Conduct public workshops on the County’s Current Use Assessment Program, Public Benefit Rating System (tax reduction) that encourage property owners to designate wetlands as open space. (Assessor-Treasurer)
2. Implement recommendations of the Clover Creek Basin Plan and Clear/Clarks Basin Plan where applicable within the plan area. (PWU, PALS)
3. Pursue the development of passive use trails that make connections throughout the Open Space Corridor. (Parks)
4. Pursue grant monies and other alternative funding sources for the purpose of educating property owners about the function and value of natural systems (wetlands, native vegetation, water resources, and fish and wildlife species) and development regulations that pertain to environmentally constrained land. (PALS, LUAC)
5. Provide environmental educational information through a variety of methods including direct mailing, public television, newspapers, and open houses. (PALS, LUAC)
6. Enhance partnerships with the Pierce Conservation District and Washington State University Extension Office and other local organizations to provide additional public education and outreach about the function and value of natural systems. (PALS, PWU)
7. Develop educational programs that focus on the importance of native vegetation, the role of trees in maintaining air quality and absorbing stormwater runoff, and methods for removing and controlling invasive plants. (PWU, PALS)
8. Utilize the expertise of the Pierce County Public Works-Water Program Division to educate area residents regarding issues related to surface water flooding and low impact development techniques. (PWU, PALS)
9. Work with the Puyallup and Chambers-Clover Watershed Councils to address water quality issues in the plan area. (PWU)
LONG TERM ACTIONS

1. Pursue grants and other alternative funding options to acquire monies that would be used to hire a consultant to conduct a wetland inventory and coordinate this inventory with the Buildable Lands Project (LUAC, PALS)

2. Utilize various strategies to acquire open space within the plan area. Plan policies shall be applied to prioritize open space acquisition and manage the acquired parcels for the communities’ long term interest in open space conservation. (Parks, LUAC, PALS)

3. Inventory all drainage ditches within the community and consider unique regulatory standards that recognize the diversity of functions provided by these facilities. (PWU, PALS)

4. Explore opportunities to coordinate a fish passage barrier survey with the Pierce Conservation District and incorporate survey results into the County’s Geographic Information System (GIS) database. (PALS)

5. Consider developing a wetland banking program. (PALS)
Aquifer Recharge Areas

- Clover/Chambers Creek Aquifer
- DRASTIC Zones: 180 or higher
- Wellhead Protection Area

Note:
Aquifer Recharge Areas include land located within any of the following:
1. The Clover/Chambers Creek Upper Aquifer Basin.
2. The boundaries of the two highest DRASTIC zones (rating 180 or higher).
3. The Wellhead Protection Area defined by ten year time of travel.

Chapter 5: Economic Element

**INTRODUCTION**

The Mid-County area can be characterized as a rural setting bisected by major transportation corridors that serve the greater Pierce County region. Thoroughfares such as 112th Street East and Canyon Road East carry commuters between residential and employment centers such as Tacoma, Puyallup, and Frederickson. Most commuters only see the plan area from the seat of their car as they make the drive through; rarely stopping to patronize the local businesses. As a result, firms located on the major arterials do not benefit from the voluminous traffic passing through the community. In addition, a jobs-housing imbalance sends people out of the area to work and purchase personal goods and services, effectively reducing the market for local suppliers.

**DESCRIPTION OF CURRENT CONDITIONS**

The Mid-County communities can be considered bedroom communities, with most area residents commuting to job locations elsewhere. The total labor force in the area is about 14,447, but total covered employment is about 5,194. This imbalance between workforce and local employment contributes to commutes for work of ½ hour or greater for 35.7% of the workforce (Table H-5).

The plan area is zoned primarily for residential uses (92%). Scattered throughout the rural residential area are home-based businesses and various types of agricultural activities. The home occupations vary in type, and the communities have not seen a dramatic increase in number over the past decade. The agricultural activities are primarily concentrated in northern...
portion of the plan area, but several horticultural nurseries can be found scattered throughout the communities.

Despite its generally rural character, the plan area is home to a wide variety of businesses representing a broad range of industries (Table H-6), with the construction industry representing 26% of all firms and employment. Most firms are small, with four or fewer employees, although the 1% of firms with employment greater than 100 account for 20% of all employment in the plan area (Table H-7).

Source: Puget Sound Regional Council

The Mid-County Community Plan area contains 1,098 acres (8%) of commercially zoned land. Numerous parcels along Canyon Road East south of 116th Street East are large undeveloped parcels. Approximately 256 acres of vacant and underdeveloped land exists along Canyon Road south of 116th Street. Nearly 23% of this vacant and underdeveloped land along Canyon Road is held in parcels that are 5 acres or larger in size. A variety of small industries exist along Canyon Road East dealing primarily in personal services. The urban area along 112th Street East is primarily built out, with 146 acres (33%) of the area considered vacant or underdeveloped. This urban corridor houses a variety of uses including civic, personal services, retail trade, and construction.

Growth in surrounding areas has been substantial over the past decade. The Frederickson area to the south contains nearly two-thirds of all industrial zoned land in unincorporated Pierce County. Frederickson is home to The Boeing Company, Toray Composites, and dozens of other small and medium sized businesses.

Description of Desired Conditions

The plan recognizes the variety of home-based businesses and encourages the types of uses that are considered compatible to the surrounding residential or industrial area. The community desires to maintain the current balance of urban commercial areas with residential areas. Attractive commercial areas can create and maintain positive images for the adjacent residential neighborhoods. The commercial areas should be designed to be compatible with the existing infrastructure and residential neighborhoods. Within the urban areas, the community wants to focus and concentrate small businesses into specific commercial or industrial areas.

The plan encourages activities in the rural residential areas that are compatible and benefit the community such as agricultural activities that maintain the character of the Mid-County community.
ECONOMIC DEVELOPMENT POLICIES

GOALS

Encourage economic development that is responsive to the needs of the community. Economic development should provide the community with a desirable balance of employment and economic return, provided that new economic development does not significantly contribute to light, noise, water, air, or land pollution.

SMALL BUSINESS DEVELOPMENT AND ENTREPRENEURSHIP

GOAL MC EC-1 Utilize existing commercial areas within the plan area for small business development.

MC EC-1.1 Encourage the combining of small lots for commercial or industrial developments.

MC EC-1.2 Create compact neighborhood centers at the intersections of 112th Street East and Waller Road, 112th Street East and Vickery Avenue, 112th Street East and Bingham Avenue, 128th Street East and Canyon Road, 144th Street East and Canyon Road, and 160th Street East and Canyon Road that allow for office uses.

MC EC-1.3 Pierce County shall work with the local business community within selected commercial target areas to develop the framework for a business improvement program including structuring local marketing efforts, physical improvements programs, parking and building improvements, special management organizations, or other programs necessary for effective revitalization of the area.

MC EC-1.4 Work with the private sector to create a 112th Street East redevelopment strategy that can mobilize local and regional resources to build an enhanced tax base.

AGRICULTURAL USES

GOAL MC EC-2 Recognize and cultivate the agricultural heritage of the plan area.

MC EC-2.1 Allow the reclamation of agricultural uses without undue regulation on sites that may have been out of production for many years.

ESTATE-TYPE DEVELOPMENT

GOAL MC EC-3 Recognize the importance of estate-type development in the Rural Separator as a part of the overall housing stock in Pierce County.

MC EC-3.1 Study the impact of this type of development pattern in the Rural Separator on building and maintaining the necessary infrastructure such as roads and schools.
IMPLEMENTING ACTIONS

The following list of actions needs to be completed in order to implement the policies contained within this plan. They are arranged according to the timeframe within which each should be completed: short, medium, or long term. Short-term actions should occur within one year of plan adoption. Mid-term actions should be completed within 2-5 years. Long-term actions should be completed within 5-10 years of plan adoption. The entity or entities responsible for leading the effort to complete the action item is listed in parenthesis following the action. Actions are assigned to the Mid-County Land Use Advisory Commission (LUAC), Pierce County Planning and Land Services (PALS), Pierce County Economic Development (ED), Pierce County Parks and Recreations (Parks), Pierce County Public Works & Utilities (PWU), and Tacoma-Pierce County Health Department (TPCHD).

SHORT TERM ACTIONS

1. Adopt design guidelines and standards and development regulations which mitigate negative impacts between commercial/industrial areas and residential neighborhoods. (PALS, CPB)
2. Adopt development regulations which encourage agricultural industries throughout the plan area.
3. Adopt development regulations which retain and encourage small businesses within existing commercial areas.

MID-TERM ACTIONS

1. Encourage home-based businesses by educating residents on the opportunities, resources, and requirements for starting a home-based business. (PALS, ED)
2. Conduct and maintain an inventory of space available for home occupations to move to when they are no longer appropriate for residential areas. (ED)
3. Explore ways to streamline the permit process, reform the regulatory environment, and develop programs to promote home-based businesses. (PALS, ED)

LONG TERM ACTIONS

1. Study the impact of estate type of development patterns in the Rural Separator on building and maintaining the necessary infrastructure such as roads and schools for this rural residential area.
Chapter 6: Facilities and Services Element

INTRODUCTION

The Facilities and Services Element of the Mid-County Community Plan may provide policy direction to decision makers in Pierce County regarding the development regulations and financial investments associated with parks and trails, stormwater facilities, sewer utilities, public schools, and transportation projects.

Urban services include, but are not limited to transportation infrastructure (such as roads, sidewalks, street trees, street lighting), parks, sanitary sewage disposal, and stormwater and surface water management systems. Facilities are generally considered the physical structures in which a service is provided. One of the principal goals of the Growth Management Act (GMA) is for cities to provide compact urban growth areas (UGAs) that accommodate the majority of growth and development in a community so that the necessary urban facilities and services are provided and delivered efficiently and cost effectively. Urban level facilities and services are only permitted within UGAs. Certain public facilities and services must be provided at a specific level of service (LOS), concurrently with development. This requirement is intended to ensure that development will not occur without the necessary infrastructure. Developers and property owners are typically required to construct the necessary infrastructure or provide a fee to compensate for their fair share of facilities and services (as associated with a proposed building or development permit) that are necessary to maintain an established LOS (as defined by Pierce County). This LOS standard for public facilities is identified in the Capital Facilities Element of the Comprehensive Plan.

DESCRIPTION OF CURRENT CONDITIONS

The following sections provide an analysis of the existing infrastructure and services in the plan area. This information provides the basis for analyzing the levels of service (LOS) for infrastructure in the community and for developing policies which articulate the community’s desires.

PARKS AND TRAILS

PUBLIC PARKS

There are 229 acres of public parks within the Mid-County Community Plan area. Pierce County Parks and Recreation has recently acquired 30 acres from Public Works and Utilities to be used as a park facility. Table H-8 provides the breakdown of public parks in the plan area:
### Table H-8: Public Parks

### Trails

Public trails, hiking, and biking provide a valuable resource to the public. Within the plan area there are 29 miles of existing trails and 3-4 miles of proposed trails as part of the 45-mile Nisqually Delta – Mount Rainier Trail. Table H-9 provides a breakdown of the trails in the plan area.

### Other Recreation Sites

The Mid-County Community Plan area contains two sport fishing areas.

### Law Enforcement and Fire Protection

The plan area is served by both the Pierce County Sheriff and Washington State Patrol.

### Pierce County Sheriff’s Department

The Pierce County Sheriff’s Department (PCSD) is the primary law enforcement agency for the plan area. There are three patrol districts that serve the area; however, there are no police stations located in the plan area. The South Hill Precinct, located a few miles southeast, and Brookdale Station, located just south of the plan area, serve the plan area as follows:

- The Pierce County Traffic Unit works out of the Brookdale Station.
- The South Hill Precinct provides patrol deputies and support, property crime detectives, clerical support, the Youth Emergency Services Unit, and the Crime Analysis Unit.
- The rest of the PCSD services are provided out of The County-City Building, including Administration, Civil, Major Crimes Detectives, Forensics, Special Investigations Unit, and the Recruiting and Training.
Six detectives are based at the South Hill Precinct, whose primary duty is to investigate property crimes. In addition, 22 detectives and deputies work from the County-City Building in the Criminal Investigations Division. Those officers are assigned to a variety of tasks including: investigating major crimes (homicide, special assault, arson, etc.), executing felony arrest warrants and investigating domestic violence-related incidents and crimes involving juvenile suspects. These resources are responsible for the entire unincorporated County, as well as providing contracted services to various cities in Pierce County. In addition, a growing group of undercover investigators is dedicated to the various drug enforcement (methamphetamine) issues in Pierce County.

Twenty-two deputies and two sergeants are assigned to the traffic unit located at the Brookdale Station. This unit provides traffic accident investigation and traffic enforcement capabilities. The station also provides the Community Support Team (CST), a team that provides non-traditional and non-call driven police services to neighborhoods experiencing chronic public safety issues.

In addition to the services described above, the plan area benefits from the ability of PCSD to provide additional special services to its citizens. These special services are made possible by training personnel to perform more than their primary (patrol and investigations) function. These personnel respond to situations on an as-needed basis. These functions include: Air Operations, Clandestine Lab Team, Dive Team, Hazardous Devices Squad, Marine Services Unit, Bicycle Unit, Search and Rescue, SWAT, and Swiftwater Rescue.

**Washington State Patrol**

One Washington State Patrol office is located in the Mid-County Community Plan area, at 2502 112th Street. This office dispatches four detachments to eastern Pierce County covering state highways in the plan area. They respond to a variety of calls for service, ranging from standard traffic stops to vehicular accident investigation. The number of troopers in the plan area varies from two to three depending on the calls for service in other areas of Pierce County.

**Fire Protection Districts**

The plan area is serviced by two fire districts: Fire Districts 6 and 14.

**Pierce County Fire Protection District 6**

Fire District 6 has two stations within the plan area. Station 6-7 is located at 8119 Canyon Road East, and Station 6-8 is located at 13511 Canyon Road East. These stations serve an area of approximately 13,614 acres.

Station 6-7 is assigned the following equipment: one engine and water tender. Station 6-8 is assigned the following equipment: two engines and one medic unit. The stations are
continually staffed by at least two fire personnel. The stations enforce burn regulations and provide CPR instruction and First Aid classes.

**PIERCE COUNTY FIRE PROTECTION DISTRICT 14**

Fire District 14 has one station within the plan area located at 4114 56th Ave. E. This station serves an area of approximately five square miles, a population of approximately 2,500. Mutual aid agreements allow the station to frequently assist in major incidents.

A chief and 40 volunteers are assigned to the station, many of whom are Emergency Medical Technicians. Over a third of the personnel are trained as Swiftwater Technicians. The station is assigned the following equipment: two engines, one water tender, one aid unit, one light rescue utility truck, and one rescue boat.

**TRANSPORTATION**

**ROADWAYS**

The Plan area can be characterized as a rural area with urban traffic volumes. Due to its location between the Cities of Tacoma and Puyallup and between the Port of Tacoma and Frederickson industrial area, it handles a significant amount of “outside” or “pass through” traffic traveling to and from those destinations. While daily traffic volumes are not considered deficient at this time, traffic congestion does occur during the morning and evening peak commute periods.

The Mid-County area is served by two State highways (State Route 512 and State Route 167) and several major arterials (Canyon Road East, Pioneer Way East, 72nd Street East, 112th Street East, and Brookdale Road East/160th Street East). Canyon Road East is the main north-south thoroughfare that runs through the middle of the plan area. 112th Street East runs in an east-west direction just south of and parallel to State Route 512. Since most of the commercial centers in the plan area are located along these two roadways, Canyon Road East and 112th Street East handle the largest volume of local and regional traffic. The County has recently completed the widening of 112th Street East west of Canyon Road East. Construction is scheduled to begin on the widening of other segments of 112th Street East and Canyon Road East later this year.

Due to the rural character of the Mid-County area, many residents walk or bike to destinations within the community. Horseback riding along the roadways is also very common. However, many of the existing local roadways within the Mid-County area are narrow and do not have shoulders or sidewalks to accommodate nonmotorized travel.
**Rail Service**

There are two railroad lines located in the Mid-County Community Plan area. The Tacoma Rail line provides limited freight service and runs through the western portion of the plan area. The Burlington Northern and Santa Fe (BNSF) line accommodates passenger rail service and traverses through the northern portion of the plan area.

**Transit Service**

Pierce Transit provides local transit service to the Mid-County area. It operates a fixed bus route (Route 409) that runs along 72nd Street E and Canyon Road E through the northern part of the Mid-County area. Another fixed bus route (Route 410) runs along 112th Street E from Parkland to South Hill. SHUTTLE service is also offered for people with disabilities and is provided within three-quarters of a mile of the roadways served by the existing fixed bus routes. In addition, Bus Plus service has been started in the Mid-County area south of 112th Street E that provides “dial-a-ride” service to and from designated bus stops in the community.

**Public Schools**

**School District Facilities Serving the Plan Area**

The plan area is served by Bethel School District #403, Franklin Pierce School District #402, and Puyallup School District #3. One tribal K-12 school (Chief Leschi) and one private high school (Mt. Rainier Lutheran High School) are also located in the plan area.

**Bethel School District #403**

Bethel School District serves 763 acres (5%) of the Mid-County Community Plan area. The district includes 15 elementary schools, 4 junior high schools, 2 high schools, and 1 alternative high school. There are no Bethel schools in the plan area. In February 2001, the voters approved a bond measure to fund a new high school, a new junior high school, modernization of Spanaway Junior High School, replacement of Kapowsin Elementary, modernization or replacement of Thompson Elementary, and the purchase of an elementary school site. In addition, the bond will assist in the purchase of more portable classrooms. All of the projects have goals of managing the current capacity and increasing the total capacity of the district. Table H-10 provides a breakdown of the current capacity and Table H-11 provides a breakdown of capacity increasing projects.

</tr>
</tbody>
</table>

The district is using 163 portables to supplement the capacity of permanent structures. The above capacity totals include portables currently in use by the district. The district uses levies, bonds, and taxes to pay for new projects and operational costs.

Franklin Pierce School District serves 7,841 acres (54%) of the Mid-County Community Plan area. The district includes eight elementary schools, two middle schools, two high schools, and one alternative high school. There are three elementary schools, one middle school, and one high school located within the plan boundary: Central Avenue Elementary, Midland Elementary School, Collins Elementary School, Ford Middle School, and Franklin Pierce High School.

In February of 2002, the district passed a four-year levy to fund educational and athletic programs. In 1998 the district passed a $25.5 million bond, and when matched by state funds totals $85 million. This money is being used to remodel schools and build new facilities. In 2003, the district opened its first new school in 35 years: Midland Elementary. This elementary is located in the Mid-County Community Plan area. The school district has additional projects to increase the capacity: Ford auxiliary gymnasium, Keithley auxiliary gym, GATES High School remodel, Keithley Middle School and Ford Middle School portables. The district plans to have all projects completed by 2006. Some of the projects are geared to address the issue of capacity within the district. Table H-12 provides a breakdown of the capacity issue and Table H-13 provides a breakdown of the projects:

The district is using approximately 35 portable classrooms to supplement the capacity of the permanent structures. The above table includes the capacity of portables. Additionally, the district plans to purchase four more portable classrooms by 2006. The district uses levies, bonds, and taxes to pay for the projects and operational costs.

**Puyallup School District #3**

The Puyallup School District serves 5,924 acres (41%) of the Mid-County Community Plan area. The district includes 21 elementary schools, six junior high schools, three high schools, and one alternative high school. There are two elementary schools located within the boundary of the plan area: Riverside Elementary and Waller Road Elementary. In February 2004, the district passed a $198.5 million bond to fund educational programs, athletic programs, and support services. The majority of the projects are targeted at increasing the capacity of the school district. The bond will pay to build two new elementary schools and one new junior high school. The funds will also pay to remodel two elementary schools, two junior high schools, and one high school: Fruitland Elementary, Meeker Elementary, Aylen Junior High, Kalles Junior High, and Puyallup High School East Campus Phase I. Finally, the bond will be used to purchase 14 new portable classrooms to alleviate the current and projected capacity of the school district: Eight for the elementary schools and six for the high school. Completion is projected by 2008. Table H-14 provides a breakdown of capacity issues and Table H-15 provides a breakdown of the projects.

The district is using 202 portable classrooms to supplement the capacity of permanent structures. The above table includes the capacity of the portables. The district uses levies, bonds, and taxes to pay for the projects and operational costs.

**LIBRARIES**

The Pierce County Library System is the library provider for the Mid-County Community Plan area. The system operates one library in the plan area located at 5107 112th St E. There is also a Processing and Administrative Center located at 3005 112th St E. Additionally, people that live in the plan area also have the option to remotely connect to the Pierce County Library System by logging on to the Library Catalog system from their home computer.

The library system is invested in the development of the Kid’s Bookmobile program. They are currently working with the Bethel School District to add more sites in the area to better serve the reading needs of children.

The Pierce County Library System is in the process of reviewing levies for Pierce County. The library staff is conducting a study to determine if they should remove the 1% levy and replace it with a 50-cent per $1,000 of assessed value levy. This would meet the statutory limit for library revenue collection. The staff is also aware of the need to conduct a Capital Facilities review; however, no decision on when that review would take place has been determined as of today.

**SANITARY SEWER**

The Mid-County Community Plan area is serviced by approximately 40 miles of sanitary sewer lines. Table H-16 provides a further breakdown of the sewer line types within the plan area.
**Table H-16: Sewer Lines**

<table>

Pierce County Sewer Code and Tacoma-Pierce County Board of Health Regulations for On-Site Sewer Systems require designated urban properties within 300 feet of an existing public sewer line to connect to the sewer system when new development is proposed. Existing developments may continue use of on-site sewer systems, unless the existing system fails and public sanitary sewers are within 300 feet or the existing structure is expanded.

In the late 1990s, Pierce County adopted regulations that require new subdivisions within urban areas not connected to sanitary sewers to construct dry-line sewer infrastructure in addition to an interim septic system. This allows for future sewer extension to the project, when the interim septic systems would be disconnected, and the dry-line infrastructure utilized. The cost of constructing an interim septic system, dry-line sewer infrastructure, maintenance, and engineering challenges have encouraged developers to connect projects to the sewer system, with limited exceptions.

**SEWER IMPROVEMENT DISTRICTS – ULIDS**

The plan area contains parts of two improvement districts: 175 acres of the 12,611-acre Lakewood/Parkland Sewer Improvement District, and 203 acres of the 378-acre Midland Sewer Improvement District.

**STORMWATER SEWER SERVICE**

**STORMWATER MANAGEMENT**

As natural vegetative cover is replaced with homes, businesses, parking lots, and roads, surface water runoff (stormwater) tends to increase both in volume and rate at which the water drains off the land. If not properly addressed, this post development increase in stormwater volume and rate can result in flooding, water quality and habitat degradation, and soil erosion.

Within the Mid-County plan area there is a network of both constructed and natural drainage systems. The majority of soils found in the plan area are of Kapowsin association, with some Puyallup-Sultan and Alderwood Everett in northern, low-lying areas. Kapowsin soils are moderately well-drained, and facilitate some natural formation of drainage channels. Most of the development that has occurred in the plan area has been at such a density that construction of large piped conveyance systems along roadways has not been necessary because runoff has infiltrated along the shoulders of the road or in roadside ditches. Only when development has become more intense (i.e., construction of a major arterial or the creation of subdivisions with more than one or two dwelling units per acre) has the need for
collecting and conveying the excess runoff to a storm drainage pond or to small scale drywell within the roadway been necessary.

Due to the drainage systems in the plan area, Clear-Clarks Creek and Clover Creek, significant flood hazards exist in many areas of Mid-County. These areas are in the northern portion of the plan area, in low-lying areas along the Puyallup River, and also along Clover Creek drainage in the southern portion of the plan area. These areas are relatively undeveloped, but have formed the natural drainage courses characterized with culverts at road crossings and steep ravines where the drainage courses traverse steep slopes. The area between Canyon Road and Woodland Avenue, and 112th Street and 144th Street includes a major system of wetlands, including 4 creeks associated with the Clear-Clarks Creek drainage: Woodland Creek, Diru Creek, Rody Creek, and Canyon Creek, which area associated with flood hazard in that area along with new development in surrounding areas.

Pierce County has developed some regional stormwater facilities just south of the Mid-County plan area. These facilities are utilized for drainage of Canyon Road East. One facility, Brookdale Pit, absorbs most excess drainage from the Mid-County plan area, and is currently at stormwater capacity. The plan area is also served by a string natural systems east of Canyon Road between 112th Street East and 144th Street East that also hold drainage from the area.

The regional systems identified above are in addition to the smaller publicly owned retention/detention ponds and a large amount of drywells associated with individual developments. These publicly owned stormwater facilities have been inventoried and are currently documented on the County’s GIS system for routine maintenance. Privately owned facilities within the plan area, which are associated with private road developments and gated communities, are not well inventoried. Private parties such as homeowners associations are responsible for maintaining those facilities. Sporadic checks have documented poor maintenance of these private facilities despite maintenance agreements required at the time of plat approval. This is probably due to loose-knit organizations of homeowners associations and lack of funding to perform the necessary maintenance. Pierce County has not had the resources necessary to track and pursue enforcement of the maintenance agreements.

**Basin Planning**

To assist in future decision making associated with stormwater issues, a series of basin plans have been prepared by Pierce County to address all aspects of surface water management. The Clover Creek Basin Plan encompasses the southern portion of the Mid-County plan area. The Clear-Clarks Creek Basin Plan has been developed for the northern portion of the plan area which drains into the Puyallup River. Implementation of the plan’s recommendations will help ensure that actions taken to improve stormwater drainage in the County are in compliance with federal and state laws and regulations, particularly the federal Clean Water Act and Endangered Species Act.
**Potable Water Supply**

Mid-County residents and businesses receive their potable water (or drinking water) from one of several types of public water systems operating under different ownership arrangements (i.e., municipal, mutual or investor-owned) or from “individual wells.” The majority of residents receive their drinking water from a Group A water system; a public water system serving more than 15 connections. While approximately 10 Group A water systems operate in the Mid-County community, the majority of the community plan area is served by one of the following: Summit Water system, the City of Tacoma, Parkland Light & Water, Fruitland Mutual, City of Puyallup or Curran Road Mutual. In addition to Group A water systems, a percentage of Mid-County residents obtain their drinking water from a Group B system; a public water system serving between 2 and 15 connections. Finally, a lesser amount of Mid-County residents obtain their drinking water from a private source or individual well.

The Washington State Department of Health (DOH) has regulatory responsibility over Group A public water systems while the Tacoma-Pierce County Health Department (TPCHD) in conjunction with DOH has primary regulatory responsibility over Group B systems. TPCHD is responsible for the permitting of individual wells. Water systems meeting certain conditions (i.e. size) are required by DOH to prepare water system plans every six years. Such plans are required to be consistent with growth and zoning conditions contained in the relevant jurisdiction’s comprehensive plan and must demonstrate how the system is to provide water service to the projected growth. All users of surface water and users of more than 5,000 gallons of groundwater per day (or irrigation of more than ½ acre of land) are required to obtain a water right from the Washington State Department of Ecology.

The Central Puget Sound area faces significant challenges in meeting the water needs for people and fish habitat with available resources. At current levels of water use, additional water supplies will be needed to meet both near-term (through 2020) and long-term (through 2050 and beyond) water demand in the region. While many of the region’s water systems would prefer the ability to drill for new sources of groundwater within their service areas, the likelihood of doing so is questionable. Instead, water systems are beginning to recognize the need to seek a regional water source to supplement existing sources of supply. Such recognition is reflected in several new regional planning efforts, such as the Central Puget Sound Water Initiative and ESHB 2514 watershed management planning processes.
DESCRIPTION OF DESIRED CONDITIONS

The urban growth area is intended to accommodate the majority of new growth and development in the community plan area. It is important therefore, that the majority of public expenditures for urban facilities and service should also be directed to UGA. Urban levels of service should be required as a component of all new development in the UGA. Pierce County should ensure that new development supports the costs associated with public facility and service expansions that are made necessary by each development project. The UGA should not exceed a size that can be serviced by the urban facilities and services that exist or can be provided within a 20-year planning horizon. Prior to expanding the UGA, it must be demonstrated that adequate public facilities and services can be provided for each public facility and service.

Due to the high rate of growth in surrounding areas, residents have experienced deficiencies in public facilities, services, and infrastructure. Ensuring that adequate parks, roads, sewer and water systems are present in the community is a major goal of this plan. The Mid-County Community Planning Board has anticipated the expected growth and accounted for the current deficiencies when forming plan policy recommendations.

PUBLIC PARKS

The objectives, policies, and standards focus on improving park, recreational, and open space opportunities within the community. Strategies are identified for possible funding mechanisms and public agency partnerships. The community recognizes the potential for the area to link numerous trails and develop a community-wide trail system that will also connect to the regional trail system.

PARK ACQUISITION RECOMMENDATIONS

Policies also identify high priority locations for possible acquisition, several that are located within or adjacent to the Open Space corridor. The potential acquisition sites are not listed in order of priority. The CPB has recommended the following sites as potential park and recreation facilities:

- Regional trail along Tacoma Pipeline Road
- Regional trail along Tacoma Rail right-of-way
- Pederson farm properties at the northwest corner of 72nd St. and Waller Road
- Surface mine reclamation sites
- Faith dairy properties at the northwest corner of 72nd St. and Vickery Ave.
- Swan Creek upland areas
- Vacant properties in vicinity of Orangegate Park

**TRANSPORTATION**

**ROADWAYS**

The policies in the Mid-County Community Plan reinforce the need to improve and widen Canyon Road East to accommodate both existing and future traffic demand. The County’s Transportation Improvement Program (TIP) already includes funding for the widening of Canyon Road East south of State Route 512 and the proposed extension of Canyon Road East north of Pioneer Way East. Based upon an analysis of year 2025 traffic forecasts, capacity improvements are recommended on other east-west major arterials that would also serve to facilitate access to Canyon Road East. It is the hope of the community that these improvements will keep commuter traffic on the arterials and away from the local neighborhood streets.

The policies also reflect the desires of local residents for additional nonmotorized improvements. Paved shoulders are proposed along many arterials in order to accommodate pedestrian and bicycle travel to neighborhoods, schools, parks, and commercial centers. Proposed multi-use trails are recommended along Tacoma Pipeline Road, Tacoma Rail Line, and the utility lines to create a nonmotorized system that connects the Mid-County area with the surrounding areas.

A listing of the motorized and nonmotorized transportation project recommendations is included in Appendix A.

**RAIL SERVICE**

As part of the update to its Long-Range Plan, Sound Transit is evaluating the upgrading of the existing Tacoma Rail line to serve passenger rail service through the Mid-County area between the Tacoma Dome and the Frederickson industrial area. Sound Transit is also planning to triple the number of weekday trips for its existing commuter rail service along the BNSF line.

**TRANSIT SERVICE**

While local residents have expressed a desire for local transit service on additional roadways, the Mid-County Community Plan area may not have the population base to support additional fixed bus routes. However, the extension of demand-responsive service (SHUTTLE, Bus Plus) to the Mid-County Community Center and other residential areas with senior housing is considered a high priority. The addition of bus stops at the commercial centers along Canyon Road E near State Route 512 is also recommended. This additional transit service is contingent upon funding availability.
PUBLIC SCHOOLS

This plan recognizes that the school districts are the responsible entity to address school district issues. Policies encourage increased coordination between the County and the district to develop strategies that address student capacity deficiencies. Specifically, the district is encouraged to actively pursue an increase in impact fees that are collected through the County’s building permit process. Additional coordination is also needed between the two entities to ensure students have safe walking routes from their neighborhoods to schools.

SANITARY SEWER

As sewer utilities are placed throughout the community to serve the population, the community recognizes the need for coordination during the construction phase to eliminate disruption and long delays in the transportation system. In efforts to maintain reasonable housing costs, the community encourages new methods and practices of sewer installation.

STORMWATER SEWER SERVICE

This plan focuses primarily on the management of surface water in efforts to reduce the amount of runoff caused from new development. Policies support the Clear Clarks Creek and Clover Creek Basin Plans’ recommendations which include discouraging development in areas prone to flooding. The community desires public and private stormwater facilities that are incorporated into the natural landscape and are properly maintained.

POTABLE WATER

Pierce County and water purveyors should coordinate their activities to ensure that an adequate and reliable domestic water supply is available to support projected population growth. The availability of an adequate potable water supply should be verified prior to the approval of new land divisions. If water purveyors are incurring problems of supplying water for new land divisions, then they should explore connections with other water systems that have adequate water supplies.
CAPITAL FACILITIES POLICIES

GOALS

Ensure that the infrastructure, facilities, and services which are necessary to support development are adequate to serve new projects at the time the buildings are available for occupancy and use without decreasing service levels below locally established minimum standards.

PUBLIC SCHOOLS

GOAL MC CF-1 The location of schools should be considered in the planning and construction of future sidewalks and pedestrian paths.

MC CF-1.1 Coordinate with the school districts to identify and prioritize designated school walking routes in need of safety improvements.

PARKS AND RECREATION POLICIES

REGIONAL PARKS

GOAL MC PR-1 Monitor and maintain the level of service for regional park facilities in the community plan area.

MC PR-1.1 Evaluate the level of service for regional parks annually.

MC PR-1.2 Correct level of service deficiencies in regional park facilities through capital improvements such as constructing new facilities or expanding existing facilities.

MC PR-1.2.1 Avoid non-capital remedies, such as lowering the desired level of service.

MC PR-1.3 The sale of publicly-owned park and open space land is discouraged within the community plan area.

MC PR-1.3.1 In the event that such sale occurs, any proceeds shall be used to purchase an equivalent or greater amount of land within the plan area for park or open space purposes.

GOAL MC PR-2 Design and locate new regional parks within the community plan area to serve the needs of community residents as well as providing countywide benefits. New regional parks should meet the following criteria:

MC PR-2.1 Locate park sites in a manner to take advantage of the physical amenities of the plan area;

MC PR-2.1.1 Priorities include stream corridors, forested sites, historical areas, and scenic vistas.
MC PR-2.2 Regional parks should generally be 40 acres or more in size; however, these parks may be developed on smaller parcels based upon land availability, facility type, community need, and site characteristics; and

MC PR-2.3 Consider charging user fees at sites that provide active recreational opportunities at an appropriate rate that will help support the maintenance and operation of these facilities.

GOAL MC PR-3 The following sites are high priority locations for regional park land acquisition within the Mid-County Community Plan area. The sites are not listed in any order of preference or importance:

MC PR-3.1 Regional trail along the Tacoma Pipeline Road. The site is currently owned by Tacoma City Water;

MC PR-3.2 Regional trail along the Tacoma Rail right-of-way. The site is currently owned by Tacoma Public Utilities;

MC PR-3.3 Pederson Farm properties at the northwest corner of 72nd Street and Waller Road;

MC PR-3.4 Surface mine reclamation sites as they become available. These sites should be acquired for open space purposes if topography precludes development of an area for active recreation;

MC PR-3.5 Faith Dairy properties at the northwest corner of 72nd Street and Vickery Avenue if they become available;

MC PR-3.6 Uplands on the east side of Swan Creek if they become available. If these properties are not available for acquisition, pursue viewshed easements or other methods for protection. These properties are intended to connect with the existing Swan Creek Park properties in the City of Tacoma;

MC PR-3.7 Vacant properties between Orangegate Park and 96th Street East that are currently enrolled in the Current Use Assessment program; and

MC PR-3.8 Provide information to the owners of these properties regarding the community interest in potential park acquisition.

GOAL MC PR-4 Consider a variety of passive and active recreational opportunities for Orangegate Park.

MC PR-4.1 Inventory existing conditions prior to park development.

MC PR-4.2 Pursue development activities in a phased manner.

MC PR-4.3 Design development to mitigate impacts to adjacent private property owners.

MC PR-4.4 Day use facilities are encouraged.

MC PR-4.5 Lighting associated with evening recreational activities is discouraged.

MC PR-4.6 Passive recreational opportunities are a community priority. Appropriate passive recreation may include:
MC PR-4.6.1  Nonmotorized trails for pedestrians, bicycles, and horses;
MC PR-4.6.2  Picnic areas;
MC PR-4.6.3  Separate on-leash and off-leash areas for dogs; and
MC PR-4.6.4  Open space.

MC PR-4.7  Pursue development of an active recreational component to provide a funding source for park maintenance and operations.

MC PR-4.8  Appropriate active recreation may include:
  MC PR-4.8.1  Multipurpose recreation building;
  MC PR-4.8.2  Multipurpose ball fields; and
  MC PR-4.8.3  Nine-hole golf course.

MC PR-4.9  Active recreational uses may be more appropriate on the northeast 40 acres.

MC PR-4.10  Passive recreational uses are more appropriate on the southwest 120 acres.

MC PR-4.11  Consider development of a trailhead parking lot with restroom facilities to serve Orangegate Park and the proposed Tacoma Pipeline regional trail.

**COMMUNITY, NEIGHBORHOOD, AND SUBDIVISION PARKS**

**GOAL MC PR-5**  Pierce County shall support the creation of a park service area or district to help fund and develop community and neighborhood scale parks throughout the plan area.

MC PR-5.1  Provide subdivision parks in all new urban residential subdivisions.

MC PR-5.2  Establish level of service (LOS) standards for community and neighborhood park and recreation facilities.

MC PR-5.2.1  Pierce County should require all new residential subdivisions and multifamily residential developments to pay an impact fee, dedicate land, or pay a fee in lieu of land dedication for the development of community and neighborhood parks based on the established LOS.

MC PR-5.2.2  Delay the implementation of the impact fee and fee in lieu of dedication program until such time as a park service area or district is formed.

MC PR-5.2.2.1  In the interim, Pierce County should require only land dedication. Focus such land dedication on the provision of subdivision parks within new residential developments.

MC PR-5.2.3  Develop regulations controlling the location, use, and improvement of land dedicated for community and neighborhood park purposes.

MC PR-5.2.3.1  Such regulations shall, at a minimum, prescribe minimum park dedication amounts, access, amenities, location, and maintenance.
MC PR-5.3  Design and locate new community and neighborhood parks within the plan area to serve the needs of all segments of the community. These parks should meet the following criteria:

MC PR-5.3.1  Locate new park sites in a manner to take advantage of the physical amenities within the plan area;

MC PR-5.3.1.1  Priorities include stream corridors, forested sites, historical areas, and scenic vistas;

MC PR-5.3.2  New parks may provide passive or active recreational areas;

MC PR-5.3.3  Community parks are typically 15 to 25 acres in size;

MC PR-5.3.3.1  Access to a community park should be from an arterial street if traffic volumes are anticipated to be high;

MC PR-5.3.3.2  Restroom facilities should be provided at a community park;

MC PR-5.3.4  Neighborhood parks are typically 5 to 10 acres in size;

MC PR-5.3.4.1  Smaller parks are appropriate when location is considered and larger sites are not available;

MC PR-5.3.4.2  Neighborhood parks should be separated from one another in a relatively even manner throughout the plan area;

MC PR-5.3.4.3  Typically a one to two-mile separation is desirable; and

MC PR-5.3.4.4  Access to a neighborhood park should be from a local residential street.

MC PR-5.4  The following sites are high priority locations for community and neighborhood park land acquisition within the Mid-County Community Plan area. The sites are not listed in any order of preference or importance:

MC PR-5.4.1  Pederson Farm properties at the northwest corner of 72nd Street and Waller Road;

MC PR-5.4.2  Faith Dairy properties at the northwest corner of 72nd Street and Vickery Avenue if they become available; and

MC PR-5.4.3  Provide information to the owners of these properties regarding the community interest in potential park acquisition.

MC PR-5.5  Provide subdivision parks in all new residential developments in the urban area (Summit View area).

MC PR-5.5.1  Provide subdivision parks in all new residential subdivisions and multifamily residential developments except when a fee in lieu of the park land dedication has been provided to a local park district that will mitigate for the impacts associated with the new residential development.

MC PR-5.5.2  The recreational area in a required subdivision park shall consist of a minimum of 5,000 square feet and shall be in a separately dedicated park tract.
MC PR-5.5.3 Improve each mini-park with a variety of amenities such as a playground, sports court, tot lot, picnic facility, gazebo, on-site water line, and associated landscaping.

MC PR-5.5.4 Connect open space tracts, screening buffers, and stormwater facilities with any subdivision park when possible to create the opportunity for a system of walking trails.

TRAILS

GOAL MC PR-6 Design and develop a community-wide trail system.

MC PR-6.1 Design trails to interconnect or form loops whenever possible. Trails should not dead-end unless unique circumstances exist such as a trail that provides access to a specific destination.

MC PR-6.2 Design a trail system to connect with regional trail systems that exist or are planned in the surrounding communities of South Hill, Frederickson, Midland, and the Cities of Puyallup and Tacoma.

MC PR-6.3 Priorities for new trail development include the Tacoma Pipeline Road regional trail, Tacoma Rail regional trail, 112th Street and Canyon Road nonmotorized bicycle and pedestrian improvements.

MC PR-6.4 Consider trail development in the Summit View area that can provide benefits to the nonmotorized transportation system by connecting urban density neighborhoods with the Canyon Road commercial district.

MC PR-6.5 Multi-use trails should incorporate existing utility corridors including water, gas, power, rail, and road rights-of-way.

MC PR-6.6 Explore strategies to remove various types of natural and built barriers to facilitate trail corridors throughout the community.

MC PR-6.7 Provide development incentives such as bonus densities and increased impervious coverage for projects that incorporate trails into the project design or provide a connection to a regional trail system.

MC PR-6.8 Consider designating trails in each subdivision and site plan approval.

MC PR-6.9 Consider granting maximum development incentives and bonuses including credit to the County park impact fee ordinance to developments that contribute significant links in a community-wide system of public trails.

MC PR-6.10 Acquire property that will support a community-wide system of trails now and in the future.

MC PR-6.10.1 Whenever possible, unopened rights-of-way and other public lands should be dedicated for trail purposes.
MC PR-6.10.2  Acquiring easements across private lands should be considered when necessary.

MC PR-6.11  Plan and construct trails along existing right-of-way corridors to minimize community disturbance. For example, railroad, utility line, and road rights-of-way should be followed when feasible.

MC PR-6.12  Utilize critical area buffers, open space areas, greenbelts in private developments, and passive and active parks for informal trail purposes.

MC PR-6.13  Encourage private property owners to donate public trail access.

MC PR-6.13.1  Compensate landowners for providing easements for public trails across private property.

MC PR-6.14  Acquire property at Pederson Farms for a trailhead.

MC PR-6.14.1  This trailhead would provide access to Swan Creek informal trails and the proposed regional trail along Pipeline Road.

**Partnerships**

**GOAL MC PR-7**  Work with area school districts to develop parks adjacent to existing and planned school sites.

MC PR-7.1  Support the development of an aquatic center in the Franklin Pierce High School neighborhood.

**GOAL MC PR-8**  Pursue opportunities to develop park and recreational facilities in conjunction with public and private utility providers.

MC PR-8.1  Partner with Tacoma City Water to develop a regional trail facility within the 100-foot wide Pipeline Road right-of-way.

MC PR-8.2  Partner with Tacoma Public Utilities to develop a regional trail facility within the Tacoma Rail right-of-way.

MC PR-8.3  Work with Pierce County Public Works – Surface Water Management to explore opportunities to utilize regional stormwater facilities for passive recreation.

**GOAL MC PR-9**  Coordinate park and recreation planning and seek funding opportunities jointly with the Cities of Puyallup and Tacoma.

MC PR-9.1  Pursue a partnership with the City of Tacoma to facilitate the proposed regional trail between Orangegate and the Swan Creek Park properties.

MC PR-9.2  Partner with the City of Tacoma (Metro Parks) to develop a regional park plan for Swan Creek Park.

**GOAL MC PR-10**  Explore alternatives for providing and maintaining publicly-owned parks and trails such as enlisting service organizations, soliciting corporate donations, and donations of goods and services from local businesses.
MC PR-10.1  The Pierce County Parks Department should facilitate an adopt a park program for Orangegate Park to encourage community support and involvement at this undeveloped park.

MC PR-10.2  Support an adopt a trail program for trail maintenance purposes.

**OPEN SPACE**

**GOAL MC PR-11**  Utilize park impact fees that are collected within the community plan area to purchase open space land within the community plan area.

**GOAL MC PR-12**  Acquire surface mine reclamation sites as they become available.

**MC PR-12.1**  These sites should be acquired for open space purposes if topography precludes development of an area for active recreation.

**TRANSPORTATION POLICIES**

**GOAL MC T-1**  Pursue options for increasing the capacity of north-south arterials within the Mid-County Community Plan area.

**MC T-1.1**  Give top priority to the funding and implementation of capacity and traffic flow improvements on Canyon Road E.

**MC T-1.1.1**  Widen Canyon Road E. to provide additional through lanes and other improvements to accommodate existing and future traffic volumes.

**MC T-1.1.2**  Improve traffic flow at the intersections along Canyon Road E. with the addition of turn lanes. All options for intersection treatments, including grade separations (overpasses or underpasses) and interchange improvements, should be considered at the most congested intersections on Canyon Road E. such as Pioneer Way E. and 72nd Street E.

**MC T-1.1.3**  Support the northerly extension and realignment of Canyon Road E. from Pioneer Way E. to 70th Avenue E.

**MC T-1.1.4**  Limit the number of traffic signals on Canyon Road E. north of SR 512.

**MC T-1.1.5**  Coordinate the timing and phasing of traffic signal operations on Canyon Road E. and other major arterials.

**MC T-1.1.6**  Facilitate truck traffic with the provision of climbing lanes on Canyon Road E. from Pioneer Way E. to 72nd Street E.

**MC T-1.2**  Give the next highest priority to the funding and implementation of roadway capacity projects that provide access to Canyon Road E.

**MC T-1.2.1**  Give priority to capacity improvements at the following locations:

**MC T-1.2.1.1**  Pioneer Way E. from Tacoma city limits to Woodland Ave. E.;

**MC T-1.2.1.2**  72nd Street E. from the Tacoma city limits to Pioneer Way E.;
MC T-1.2.1.3  Pioneer Way E./Waller Road E. intersection;
MC T-1.2.1.4  128th Street E./Woodland Avenue E. intersection;
MC T-1.2.1.5  Portland Avenue E. from 112th Street E. to SR 512;
MC T-1.2.1.6  Brookdale Road E. from 38th Avenue E. to Canyon Road E.; and
MC T-1.2.1.7  160th Street E. from Canyon Road E. to Woodland Avenue E.

MC T-1.3  Support implementation of capacity improvements on the state highway system. These projects are expected to provide congestion relief by diverting pass-through traffic away from the Mid-County area. Priority should be given to the improvement of the SR 512/Canyon Road E. interchange and the SR 512/Portland Avenue E. interchange.

MC T-1.4  Collaborate with developers to identify and preserve right-of-way within proposed transportation corridors.

NONMOTORIZED TRAVEL

GOAL MC T-2  Consider strategies that make pedestrian circulation systems safe, convenient, and efficient.

MC T-2.1  Accommodate pedestrian and bicycle travel by providing continuous paved shoulders, sidewalks, and/or wide curb lanes along at least one east-west and one north-south roadways through the community.

MC T-2.2  Provide pedestrian access to commercial centers either in the form of sidewalks for large centers or trails and paths in smaller centers. Priority should be given to the commercial centers near SR 512 and Canyon Road East.

MC T-2.3  Provide paved shoulders, sidewalks, or wide curb lanes on arterials and on some local streets to improve safety for pedestrians, bicyclists, and equestrians.

MC T-2.4  Provide paved shoulders, sidewalks, or wide curb lanes on roads leading to all schools to allow children to walk or bike to school.

MC T-2.4.1  Priority should be given to the Franklin Pierce High School zone.

MC T-2.5  Separate pedestrian facilities from roads with planting strips, where adequate right-of-way exists, in high use areas such as schools, commercial, and recreation areas.

MC T-2.6  Convert roadside ditches into shoulders through the use of covered culverts or grating, if feasible, at schools, parks, and recreational fields.

MC T-2.6.1  The length of the shoulder improvement should be no more than one-half mile.

MC T-2.7  Provide shoulders or paths on roadways with ditches to improve pedestrian safety.
MC T-2.7.1 If the shoulder or path cannot be provided alongside the ditch, then it should be located on the opposite side of the roadway where ditches are not located.

GOAL MC T-3 Consider nonmotorized facilities in all development approvals and roadway construction.

MC T-3.1 Require new subdivisions, new multifamily complexes, and new manufactured home parks that are adjacent to a nonmotorized route within the Pierce County Transportation Element to provide direct access to the route.

MC T-3.2 Require developers of residential, commercial, and industrial projects to construct facilities for pedestrians on existing County arterials that abut their property, whenever feasible.

MC T-3.2.1 In urban areas, a sidewalk, path, or paved shoulder shall be provided on the sides of the arterial where the development is located.

MC T-3.2.2 In rural areas, a paved or gravel shoulder shall be provided on the sides of the arterial where the development is located.

MC T-3.2.3 Where adequate right-of-way exists in rural areas, a pedestrian pathway that is separated from the arterial should be considered.

MC T-3.3 Require pedestrian linkages between adjacent business properties to encourage more pedestrian movement between those properties and reduce unnecessary vehicular movements.

MC T-3.4 Provide facilities for pedestrians when reconstructing or building new arterials, whenever feasible.

MC T-3.4.1 In urban areas, sidewalks shall be provided on both sides of the arterial.

MC T-3.4.2 In rural areas, a paved or gravel shoulder shall be provided on both sides of the arterial.

MC T-3.4.3 Where adequate right-of-way exists in rural areas, a pedestrian pathway that is separated from the arterial should be considered.

MC T-3.5 Include paved shoulders or wide curb lanes to accommodate bicyclists when reconstructing or building new arterials, whenever feasible.

GOAL MC T-4 Provide safe and continuous pedestrian access throughout the Canyon Road E. corridor.

MC T-4.1 Provide pedestrian access onto new development sites from Canyon Road E.

MC T-4.1.1 Where a use fronts more than one street, pedestrian access should be provided from both streets, if possible and desirable.

MC T-4.2 Provide an internal sidewalk or pathway system connecting individual businesses, office, and residential buildings with the adjacent sidewalk system, parking lots, open spaces, and adjacent properties, where desirable.
GOAL MC T-5
Plan and implement a pedestrian and bicycle system to connect with the pedestrian and bicycle systems that exist or are planned in the surrounding communities of Midland, Frederickson, South Hill and the Cities of Tacoma and Puyallup.

MC T-5.1 Priority improvements should include the 112th Street E and Canyon Road E pedestrian and bicycle improvements.

GOAL MC T-6
Accommodate equestrian travel in the design of shoulders, where appropriate. Consider the use of gravel paths for horse riders adjacent to the shoulder or any roadside ditches.

COMMUNITY CHARACTER

GOAL MC T-7
Preserve the history and heritage of the community by retaining the rural character of the local roadways.

MC T-7.1 Give preference to paved or gravel shoulders instead of sidewalks on roadways in the rural areas.

MC T-7.1.1 Sidewalks are not consistent with the rural character of the community and should be discouraged in the rural areas.

MC T-7.2 Limit sidewalks to the major arterials and to areas where schools and businesses are located.

MC T-7.3 Discourage the use of sound walls in the rural areas.

MC T-7.4 Ensure that transportation routes used by mining operations are well lit and safe for motorists to travel.

MC T-7.5 Include vegetated or landscaped buffers or setback areas between any new sidewalks or pathways and the roadway, where feasible.

MC T-7.5.1 If possible, any buffers or setback areas should consist of natural vegetation instead of supplemental landscaping.

ENVIRONMENTAL CONSIDERATIONS

GOAL MC T-8
Utilize trees and native vegetation to improve roadway aesthetics and air quality and to reduce the impact of traffic noise upon adjacent land uses. Provide buffers adjacent to arterials.

MC T-8.1 Include roadside native vegetation and trees in the buffer areas adjacent to arterials, whenever feasible.

MC T-8.1.1 Any new native vegetation or trees should be located outside of the arterial right-of-way and should be maintained by the adjacent private landowner.

MC T-8.1.2 Ensure that any plantings do not affect driver visibility or line of sight.
MC T-8.2 Include vegetated or landscaped buffers or setback areas between any new sidewalks or pathways and the roadway, where feasible.

MC T-8.2.1 If possible, any buffers or setback areas should consist of natural vegetation instead of supplemental landscaping.

ACCESS CONTROL

GOAL MC T-9 Enhance connectivity between developments along the Canyon Road East corridor and 112th Street East corridor, where desirable.

MC T-9.1 Provide the opportunity for connections linking new development on Canyon Road East and 112th Street East to surrounding areas and the greater community.

MC T-9.2 Provide automobile connections to adjacent properties along Canyon Road East corridor and 112th Street East corridor through the use of cross street easements, common entryways, shared internal driveways and parking lots, and similar techniques.

MC T-9.3 Encourage the consolidation of access to Canyon Road East, 112th Street East and other major and secondary arterials to reduce interference with traffic flow on the arterials and to reduce conflicts between nonmotorized modes of travel and motor vehicles.

MC T-9.4 Limit the number of new driveways and intersections along River Road (SR 167 North), Canyon Road East, 112th Street East and other major arterials.

MC T-9.4.1 The spacing between driveways and intersections should be maximized.

MC T-9.5 Encourage the use of side streets, whenever feasible, to provide vehicular access to new development on corner lots on Canyon Road East and 112th Street East.

MC T-9.5.1 Driveways for corner lots on Canyon Road East should be limited to right turn ingress and egress only.

TRANSIT SERVICE

GOAL MC T-10 Promote increased transit service within the plan area.

MC T-10.1 Encourage transit agencies to provide a range of cost effective services that link residential neighborhoods with major travel destinations.

MC T-10.2 Encourage transit agencies to provide Bus Plus and SHUTTLE bus service and better access in the Summit-Waller area.

MC T-10.2.1 Priority should be given to extend service to the Mid-County Community Center.

MC T-10.3 Encourage transit agencies to provide bus stops at multifamily or high density residential areas and at public service facilities such as the Mid-County Community Center.
MC T-10.4  Encourage transit agencies to establish local bus service operating along Canyon Road East with convenient bus stop locations at the commercial and retail centers.

MC T-10.5  Work with Pierce Transit to provide improved marketing and promotion of the full range of transit services available to Mid-County residents including local fixed route services, regional express routes, connections to commuter rail, Bus Plus service, paratransit services for persons with disabilities, and vanpool and ridesharing matching services.

**Utilities Policies**

**Sanitary Sewer**

**GOAL MC U-1**  Sewer and wastewater treatment facilities enable higher intensity development to occur within urban areas. Construction of these facilities can also disrupt traffic patterns and utility services. The intent of the sewer and wastewater treatment policies is to provide guidelines on coordinating infrastructure improvements and encourage better methods and techniques during the design and construction phases.

**MC U-1.1**  Schedule construction activities to avoid sensitive time periods in the life cycle of fish and wildlife, such as spawning, nesting, and migration.

**MC U-1.2**  Whenever possible, construction will be scheduled to minimize disruption of access to area residences and businesses.

**Stormwater**

**GOAL MC U-2**  Identify the areas within and adjacent to the community that are highly sensitive to changes in hydrologic conditions and functions.

**MC U-2.1**  Within these highly sensitive areas, establish standards that provide for near zero change in hydraulic and hydrologic function on a property (i.e., no net increase in the peak flow or volume of runoff or erosion leaving a site) post development.

**GOAL MC U-3**  Support the Clear/Clarks Creek Basin and Clover Creek Basin planning efforts.

**MC U-3.1**  Request that the basin planning process model changes to hydrologic conditions resulting from development under current land use designations and under the changes to land use designations proposed by the community plan.

**MC U-3.2**  Consider the basin modeling results when making decisions regarding the allowable range and intensity of land uses within the community.

**MC U-3.3**  Coordinate the identification of appropriate areas for potential rezoning with the watershed basin planning processes.
POTABLE WATER

GOAL MC U-4  Revise water service boundaries in cases where the designated water service provider cannot provide timely or reasonable service.

IMPLEMENTING ACTIONS

The following list of actions needs to be completed in order to implement the policies contained within this plan. They are arranged according to the timeframe within which each should be completed: short, medium, or long term. Short-term actions should occur within one year of plan adoption. Mid-term actions should be completed within 2-5 years. Long-term actions should be completed within 5-10 years of plan adoption. The entity or entities responsible for leading the effort to complete the action item is listed in parenthesis following the action. Actions are assigned to the Land Use Advisory Commission (LUAC), Pierce County Planning and Land Services (PALS), Pierce County Economic Development (ED), Pierce County Parks and Recreations (Parks), Pierce County Public Works & Utilities (PWU), and Tacoma-Pierce County Health Department (TPCHD).

SHORT TERM ACTIONS

1. Adopt standards for the placement and design of stormwater facilities.  (PALS, PWU)
2. Utilize basin planning hydrologic condition modeling when making decisions regarding the allowable range and intensity of land uses.  (CPB, PALS)

Parks

1. Annually evaluate the level of service for regional parks in the plan area and correct deficiencies through capital improvements.  (Parks)
2. Coordinate with the City of Tacoma to initiate a study to determine the feasibility of developing Tacoma Pipeline Road as a regional multi-use trail.  (Parks, PALS, PWU)

Transportation

1. Revise development standards to require developments to provide safe, convenient, and efficient connections between adjacent existing or future residential and commercial developments.  (PWU, PALS)
2. Consider amending the Pierce County Capital Facilities Element and Six-Year Transportation Improvement Program (TIP) to include the highest priority motorized and nonmotorized transportation projects in the Mid-County Community Plan as identified in Appendix A.  (PWU)
3. Coordinate with the Washington State Department of Transportation (WSDOT) to request capacity and operational improvements to the SR 512/Canyon Road East interchange and the SR 512/Portland Avenue East interchange and to investigate safety improvements on SR 167 (River Road).  (PWU)
4. Amend development regulations to establish options for the County to preserve and acquire right-of-way within identified transportation corridors.  (PALS, PWU)
5. Evaluate development regulations to ensure that cumulative traffic impacts are properly addressed and mitigated in accordance with State Environmental Policy Act (SEPA) requirements. (PALS, PWU)

6. Develop and implement a viable transportation impact fee program for funding transportation improvements and meeting concurrency requirements. (PWU)

7. Amend development regulations and roadway design standards to encourage the provision of nonmotorized facilities in new developments and in all new roadway construction. (PALS, PWU)

8. Coordinate with school districts to identify and prioritize pedestrian and bicycle improvements for upcoming grant funding applications. (PWU)

9. Coordinate with Pierce Transit to initiate demand response transit service to those areas of the Mid-County area which are not currently served by transit. Emphasis should be given to the Mid-County Community Center. (PWU)

**Mid-Term Actions**

1. Evaluate the short platting and subdivision ordinances to ensure the availability of potable water is taken into account during all phases of the permitting process. (PALS, PWU)

2. Amend the Coordinated Water System Plan (CWSP) to revise water service boundaries where the designated water service provider cannot provide timely or reasonable service. (PWU)

3. Coordinate with the school districts to develop strategies that address student capacity issues. (PALS)

4. Monitor the effectiveness of LID projects and the ability to meet the established goals of the LID standards. (PWU, PALS)

**Parks**

1. Amend the Pierce County Parks and Recreation Plan to include criteria established in this plan element for the design location, and acquisition of parks and/or parklands within the plan area. (Parks)

2. Utilize the level of service standards and the design and location standards when establishing neighborhood or community scale parks. (Parks)

3. Partner with the Franklin Pierce and Puyallup School Districts to facilitate joint County-District recreational opportunities within the community. (Parks)

4. Consider charging user fees at active recreational sites to help support the maintenance and operation of these facilities. (Parks)

5. Develop mechanisms that allow impact fees, land dedication or fee-in-lieu-of land dedication for the future park development. (PALS, Parks)

6. Develop regulations that control the location, uses, and improvements on land dedicated for community and neighborhood park purposes. (PALS)

7. Pursue opportunities to develop park and recreational facilities in conjunction with public and private utility providers and adjacent cities. (Parks)

8. Facilitate “adopt a park” and “adopt a trail” programs within the plan area. (Parks, PWU)
9. Develop a purchase of development rights program and transfer of development rights program to support open space preservation within the plan area. (PALS, Parks)

**Transportation**

1. Create a process for increased bonus densities when right-of-way is donated, access is shared, or other public improvements, including road improvements and sewer extensions, are made. (PALS)
2. Coordinate with the Franklin Pierce, Puyallup and Bethel School Districts to identify and prioritize designated school walking routes in need of safety improvements. (PWU)
3. Consider amending the Pierce County Transportation Element to include the motorized and nonmotorized transportation projects and priorities in the Mid-County Community Plan as identified in Appendix A. (PWU)
4. Coordinate with the Washington State Department of Transportation (WSDOT) to ensure that capacity improvements to SR 512 and other State highways that will reduce traffic congestion in the Mid-County area are included in the updates to the Highway System Plan (HSP) and other WSDOT planning and programming documents. (PWU)
5. Coordinate with the neighboring cities, WSDOT, school districts, and utility companies to develop a study to identify an interconnected system of nonmotorized improvements throughout the Mid-County area. (Parks and Recreation, PALS, PWU)
6. Work with Pierce Transit to expand the range of transit services and to increase the number of bus stops within the Mid-County area. (PWU)
7. Incorporate flexibility in the design of motorized and nonmotorized facilities in order to improve aesthetics and minimize environmental impacts. (PWU)

**LONG TERM ACTIONS**

1. Coordinate recommendations from the Clover Creek Basin Plan and Clear/Clarks Creek Basin Plan with any updates to the community plan to address surface water runoff and flooding issues. (PALS, PWU)
2. Evaluate Surface Water Management Fees based on the performance standards resulting from basin planning efforts. (PWU)

**Parks**

1. Update maps and add signs and directional markers as the nonmotorized transportation network develops and destinations are connected. (PWU, Parks and Recreation)
2. Support efforts to establish mechanisms that support the development of neighborhood and community scale parks by identifying local interest groups and conducting a series of education workshops regarding the formation, financing, and management of parks service areas and districts. (Parks)
3. Design and develop a community-wide trail system according to trail policies. (Parks, PWU)
4. Provide development incentives such as bonus densities, increased impervious coverage, and credit to the County park impact fee ordinance for projects that
incorporate trails into the project design or provide a connection to a regional trail system. (PALS, Parks)

Transportation
5. Update maps and add signs and directional markers as the nonmotorized transportation network develops and destinations are connected. (PWU, Parks and Recreation)

Mid-County Community Plan
Chapter 7: Plan Monitoring

Purpose

The 1990 State Growth Management Act (GMA) requires jurisdictions planning under GMA to report on progress made in implementing the Act, and to subject their comprehensive plans to continuing evaluation and review. As part of the County’s Comprehensive Plan, the Mid-County Community Plan is subject to this requirement. One mechanism for conducting this evaluation and review is to monitor the development standards, regulations, actions, and other programs called for in the plan for the purpose of determining their effectiveness in fulfilling the vision of each of the five plan elements.

This section provides a framework both for monitoring the various actions undertaken to implement the plan and for offering recommendations to make adjustments to the actions in order to achieve the plan’s vision. Actions may include the development and implementation of regulations and design standards, coordinating the provision of facilities and services with other entities, developing educational programs and handouts, acquiring parks, preserving open space, and other actions. This framework for monitoring provides a means for measuring the effect of each action, identifies participants and their roles in monitoring the actions, lays out time frames, and specifies how the monitoring program should be documented. Information obtained from the monitoring program will be used to offer recommendations to decision makers as to what changes the community plan may need in order to attain specified goals and meet the visions in the plan.

How to Measure the Effect of Standards

The Mid-County Community Plan identifies actions that need to be implemented to meet its vision, goals, objectives, principles, and standards. Monitoring evaluates the effectiveness of the actions in fulfilling the plan policies. The monitoring program outlined here includes several steps which are intended to identify actions taken, the ease with which they can be used, and whether the actions actually meet the objectives they were intended to achieve.

To do this, the monitoring program is divided into five steps: Actions, Inputs, Process, Outputs, and Outcomes. Each of the steps and the responsible participant are discussed briefly here.

Phase 1 – Actions:

Phase 1 monitoring would consist largely of reviewing the policies and standards stated in the plan and identifying all the actions that need to be undertaken to be consistent with the plan. The actions should be grouped according to the objectives they are intended to meet. PALS staff and the Mid-County Advisory Commission would be the primary participants in this activity.
**Phase 2 - Inputs:**

Phase 2 monitoring would determine whether actions called for in the plan have actually been undertaken and completed. PALS staff would evaluate if regulations and design standards have been adopted and are being implemented. The PALS staff, LUAC, or other County Departments would review the plan to determine if other actions have been completed and could be done to accomplish the vision of the plan.

**Phase 3 - Process:**

Phase 3 monitoring would evaluate whether an action is straightforward, understandable, or easy to use. In the case of regulations and design standards, those persons who have submitted permit applications requiring compliance with the regulations and design standards would need to be involved in the evaluation. The Pierce County Hearing Examiner and the LUAC, which review such applications, as well as PALS staff, would need to be included in the monitoring. PALS staff would coordinate the monitoring and could conduct interviews or distribute questionnaires to persons who have submitted or reviewed permit applications subject to the regulation being monitored.

**Phase 4 - Outputs:**

Phase 4 monitoring would determine whether the action has been carried out as stated in the plan. For example, monitoring would determine whether a regulation or design standard has been complied with and identify reasons for any noncompliance. In regard to non-regulatory activities, monitoring would determine whether the objectives of the activity have been met. Participants would include residents, property owners, the LUAC, and PALS staff.

**Phase 5 - Outcomes:**

Phase 5 monitoring would evaluate the extent to which each action results in the desired effect on the community. The primary participants are the residents and property owners in the plan area. Assistance would be provided by the LUAC and PALS staff. PALS staff would assist in organizing public meetings, preparing and distributing questionnaires, and using other means to gather this information.

**Timeline**

It is anticipated that the Mid-County Community Plan will take a substantial period of time to be implemented. There are a number of actions that can be accomplished within a short timeframe, some will take much longer, and others will involve ongoing actions with no specific completion date. It is important that monitoring be done on a continuing basis with specific actions monitored at different times.
In regard to monitoring the development and implementation of regulations and design standards, it would be appropriate for monitoring to be phased over time as the five phases outlined above are accomplished. Phase 1 would begin almost immediately upon the plan adoption. Phase 2 would take place within two years following the plan adoption. This would provide adequate time for the County Council to adopt implementing regulations called for in the plan. Phases 3, 4, and 5 would occur within two to three years following completion of Phase 2. This would allow time for the regulations to be applied to a number of development projects. Phase 3 analysis of how understandable the regulations are, and the ease to which they can be applied, would then be based on the application of the regulations to those projects developed within that time period. Phases 4 and 5 monitoring would be done simultaneously with Phase 3 monitoring. The total time for initial monitoring for Phases 1 through 5 would be about five years. As changes are made to regulations and design standards, the monitoring cycle would need to be repeated to address the changes.

Other actions that do not involve the implementation of regulations or design standards would be monitored on a similar timetable. Phase 1 and Phase 2 would occur within two years of adoption of the plan, while Phase 3, 4, and 5 monitoring would occur within five years of plan adoption.

As amendments are made to the plan, monitoring would need to continue to determine how effective the changes are in carrying out the goals in the plan. In addition, it would be appropriate to continue monitoring all actions in the plan every five years to evaluate whether the actions continue over time to effectively carry out those goals.

**DOCUMENTATION**

A review of baseline information is necessary to effectively monitor whether the goals of the Mid-County Community Plan are being met. Information regarding community attitudes, visual characteristics of the community, community services, infrastructure, business climate, land uses, permitting activity, and other community characteristics would be evaluated.

As each phase of monitoring is completed, a report should be prepared by PALS staff which identifies the action being monitored, the specific purpose of the monitoring, methods used in monitoring, data collected, analysis of the data, and recommendations for further action. The report should be submitted to the LUAC for review and comment and to the County Council for its consideration.

**RECOMMENDATIONS FOR FURTHER ACTION**

In addition to determining the effectiveness of the plan in fulfilling the goals of the community, a key component to monitoring would be the recommendations for further action. These recommendations should clearly identify the specific goals being addressed, how the recommended action corrects a deficiency in the plan, how the recommended action will contribute to fulfilling the goal in question, and a timeline for completing the proposed action.
The Parkland-Spanaway-Midland Communities Plan’s narrative text and policies are in addition to the Countywide Comprehensive Plan narrative text and policies and are only applicable within the Parkland-Spanaway-Midland Communities Plan Boundary.

- “Current” or “Existing” conditions are in reference to conditions at time of adoption (Adopted Ord. 2002-22s, Effective 9/3/2002).
- “Proposed” or “Desired” conditions are those which required Council action and may have also been amended over time through a Comprehensive Plan Amendment (amendments are reflected in this document).

Chapter 1: Introduction

Overview of the Plan Area

The Parkland-Spanaway-Midland (PSM) Communities Plan area encompasses approximately 13,003 acres (20.3 square miles) and is located in west-central Pierce County. The plan area includes three separate, but interconnected communities, tied by history, environmental features, transportation issues, and growth pressures. The PSM Communities Plan area is bounded on the north by the City of Tacoma, the west by the City of Lakewood, McChord Air Force Base, and Fort Lewis, on the south by Fort Lewis, and on the east by the Summit-Waller/North Clover Creek Collins and Frederickson Community Plan areas.

General Characteristics

The communities are characterized by a mix of historic urban communities, new suburban residential neighborhoods, semi-rural and large lot residential areas, Pacific Lutheran University, Sprinker Recreation Center/Spanaway Park, the Clover Creek and Spanaway Creek watersheds, Spanaway and Tule Lakes, and major commercial and transportation arterials (i.e., SR 512, Pacific Avenue/Mountain Highway, Portland Avenue, 112th and 176th Streets, and Steele Street/Spanaway Loop Road). The plan area had an estimated 1999 population of approximately 60,104 residents with significant growth since that time. While these communities share some common characteristics, each community has its own unique pattern of development.

Parkland

Parkland is defined by the presence of Pacific Lutheran University (PLU). The wooded, small lot, urban pattern of the north-central part of the community goes back to its platting in the 1890s. Parkland’s character was altered significantly by the construction of the SR 512 freeway that resulted in splitting the community north to south. The newer residential portions of Parkland lie to the east of Pacific Avenue and south of PLU; both areas have experienced significant growth in recent decades. The western edge of Parkland is characterized by Clover Creek drainage, its wetlands, and wooded large lot residential areas and historic farmsteads. Besides PLU, Parkland is characterized and influenced by the presence of the heavily used Pacific Avenue commercial corridor, which is the main link from SR 512 and I-5 to Bethel, Graham, Frederickson, and Spanaway areas, as well as the main route to Mount Rainier National Park. The historic Garfield Street neighborhood, at the eastern edge of PLU, serves as the pedestrian commercial center of the community and university.

Spanaway

Spanaway is defined by the presence of Spanaway Lake and the associated regional recreation centers, e.g., Sprinker Recreation Center, Spanaway Park, and Lake Spanaway Golf Course. The historic Spanaway town site lies to the south of Spanaway Park on the eastern shore of
Spanaway Lake. Spanaway has grown substantially in recent decades with suburban and large lot residential neighborhoods developing on the east side of Pacific Avenue and in the areas surrounding Spanaway Lake. As with Parkland, Spanaway is characterized by the Pacific Avenue corridor, as well as Old Military Road (the entrance to the east gate of McChord AFB), and 176th Street (the main east-west link to Frederickson and South Hill).

**Midland**

The community of Midland can also trace its settlement back to the 1890s, when it was a farming community, with a town site platted along the southern end of Portland Avenue. Midland today is characterized by a mix of urban residential development, interspersed with large lot residential areas, pastures, wetlands, and woodlands. The community is accessed and characterized by the Portland Avenue transportation and employment corridor. Most commercial development in Midland is focused along the 72nd Street corridor where it borders with East Tacoma. A significant amount of light industrial uses exists in the vicinity of the historic town site along Portland Avenue and in close proximity to SR 512.

**History of the Communities Plan Area**

**Early Settlers**

The first inhabitants of the Parkland-Spanaway-Midland area were the Squally Indians. There were abundant food sources on the prairies and in Clover Creek, such as salmon, trout, elk, deer, bear, berries and edible roots that were hunted or gathered by the Native Americans. The British-owned Hudson Bay Company established Fort Nisqually, which was located in the present-day City of DuPont, to operate a fur-trading business. The company also established an agricultural subsidiary called the Puget Sound Agricultural Company. Twelve thousand sheep, 3,000 cattle, and 300 horses are said to have grazed the Puget Sound Agricultural Company land. The Hudson Bay Company personnel were the first European inhabitants of the south Puget Sound area.

The communities of Midland, Parkland, and Spanaway started as farming communities over 125 years ago. The Donation Land Act passed by the U.S. Congress in 1850 brought a major influx of new settlers into the area. The law provided 320 acres to single adult male citizens over twenty-one years of age. Married couples could claim 640 acres (one section) of the land. After the law expired in 1855, the Homestead Act was passed in 1862, granting 160 acres to individual citizens. The first wagon train of pioneers arrived in Pierce County in 1853. The earliest pioneers that settled in Parkland were Thomas and Agnes Tallentire. Some of the early donation land claimants included the Mahons, Smiths, Pattisons, and Moreys.

Hops became a cash crop among the early settlers after the 1870s. Virgin forests of Douglas fir, cedar, alder, hemlock, and maple were logged for timber. Settlers fished for salmon in the creeks and established orchards and used the area for grazing sheep and cattle. Agricultural activities continued through the 1880s. The original Parkland Post Office was established in 1891. Spanaway was one of the earliest areas of settlement in Pierce County with the
settlement record dating back to the late 1840s. The name "Spannuch" later modified to Spanaway is believed to have been derived from a Native American word referring to Spanaway Lake. Early donation land claimants adjacent to the shores of Spanaway Lake were Henry and Minerva de la Bushalier. The title to the land was given to the couple in 1854.

The first military road constructed in the State of Washington (1853) connected Fort Steilacoom with Fort Walla Walla. The existing Military Road S. in Spanaway is a remnant of that original road. In 1870, one hundred thirty German residents of Chicago came to the area responding to a plea from the territorial governor to come and settle in the area. Gustav F. C. Bresemann, born in Germany and trained in cabinet making, was one such immigrant. Mr. Bresemann and his business partner, Burow, started the first furniture manufacturing plant in the area supplying manufactured fine furniture to many homes in Tacoma and the surrounding area. Mr. Bresemann sold his land and water rights to Tacoma Light and Power Company in 1888. Some of the early settlers included the Rohr, Simond, Bittner, Benston, and Berger families who settled in the community in the 1880s and 1890s. Some of these early immigrant families went into agriculture that provided a variety of meat products including sausage, dairy products, and woolen products. Hops, potatoes, and vegetables were also produced on farms and sold. Many later lost their land when condemned for the Army Post.

**Parkland - Early Days**

The establishment of the Pacific Lutheran University (PLU) campus and attraction of Scandinavian settlers into the community had a major influence on the development pattern beginning in the 1890s. The Pacific Lutheran Academy which later became Pacific Lutheran University opened in 1894 when Old Main, the present day Harstad Hall, was completed. The first general merchandise store was located at 414 Garfield Street. Homes began to be built in the center of Parkland in 1890. Bjug Harstad, the inspirational leader and Lutheran pastor, was elected the first President of PLU.

The Methodist Church of the Parkland area was built in 1900. The completion of the Northern Pacific Railroad with the location of its western terminus in Tacoma in 1887 spurred rapid growth in the area. In fact, Tacoma became a booming town. The population in Tacoma grew from 1,000 to 45,000 within the ten year period of 1880 to 1890. The Parkland and Brookdale areas were platted in 1890 by William Wilson and Frank D. Nash to provide residential sites for the rapidly growing urban population.

The Parkland area grew rapidly during the 1890s and the community was soon established as a Tacoma suburb. The rail lines were extended from Tacoma to Fern Hill, Parkland, and Spanaway in 1888. The steam-powered locomotive called "Old Betsy" ran from Tacoma to Lake Park (Spanaway) through Edison (S. Tacoma Way) and Parkland with passengers. The street car was discontinued in the 1930s.

**Spanaway - Early Days**

The Spanaway community was a busy transportation and recreation center in the early 1890s as the southern terminus of the Tacoma and Columbia Railroad. The three-story, seventy-two room Hotel Spanaway was constructed near the depot at the southern terminus of the line at
161st South and Park. The Columbia River Railway and Navigation Company platted the town and named the community Lake Park. The economic panic of 1893 stopped further development activities. Active promotion by the railroad company and the railroad connection from Tacoma via suburbs to Lake Park (Spanaway) made Spanaway the most popular recreational spot in the area. In 1903, Spanaway Park was founded. Managed by the Metropolitan Park District, the area was used for public water supply and recreation. In 1910, Bresemann purchased adjacent property containing 45 acres of land with 1,500 feet of waterfront. For many years, Bresemann managed the property as a private recreation facility. Pierce County entered into the scene when the Metropolitan Park District deeded land to the County. Additional property was acquired into the park system when Pierce County purchased the 45 acres from Bresemann. In 1917, Camp Lewis Military Base was established on the Nisqually Plains as a training and mobilization center. Elmhurst Mutual Power and Light was established in 1922 to provide electrical service in Spanaway.

**Midland - Early Days**

The initial settlement of Midland was focused around farming activities. Around 1900, a town site was platted along the south end of Portland Avenue. This part of Midland has been a focus of commercial and some industrial activity for decades.

**Recent Past**

The area was relatively unaffected by World War I and the years of 1920-1934 saw few changes beyond the formation of Fort Lewis. In 1927, Fort Lewis became one of the three sites for main divisional posts in the country. The Great Depression of 1929 created severe financial difficulties for the public school district, the Parkland Golf Association, and Pacific Lutheran University. The depression, however, did not significantly alter business activities in Parkland or Spanaway. Until 1940, the community grew slowly and continued to retain a distinctly rural character.

The years between 1940 and 1960 brought significant changes to the area’s character. By 1941, community population increased to 750 persons and PLU enrollment reached 500 students. World War II brought significant growth into the area. In 1940, the military population of Fort Lewis increased to 30,000 and McChord Air Force Base, which had been acquired by the government in 1938, became an active air lift and air defense station. Between 1945 and 1955, the following developments occurred: a large influx of war veterans caused unprecedented increases in demand for goods and services; demands for new housing were at an all time peak; the enrollment at PLU increased to 600 students; twenty-one of the twenty-three major buildings on campus were erected; Garfield Street was paved in 1946; strip development began to occur along Pacific Avenue; and the Pierce County Refuse Company was established. In 1948, the Franklin Pierce School District was formed and the Parkland Post Office was opened in 1955.

By 1960, Parkland-Spanaway’s conversion from frontier to suburbia was complete. With a population in 1964 of 18,450, the area was faced with the contemporary developmental
problems of annexation, incorporation, utility expansion, drainage and sewer related problems, and sprawl development.

Residential and commercial growth in the area continued in the 1950s due to additional personnel stationed at the military bases. The community continued to grow from the latter part of the 1950s and through the 1960s and 1970s. Small business establishments continued to serve the communities in semi-rural, general store formats. However, as transportation access improved, residents shopped outside the community at the commissaries of McChord and Fort Lewis, Lakewood’s Villa Plaza which opened in the late 1950s, and the Tacoma Mall which opened in the 1960s. Many small businesses that depended on local clientele could no longer be sustained.

The formation of the Pierce County sanitary sewer system in the mid-1970s and its extension into the Parkland, Spanaway, and Midland communities significantly influenced residential growth. As the communities have grown residentially, so has the commercial development along Pacific Avenue. A commercial corridor has continued to expand to meet the needs of Parkland-Spanaway residents and those residents in rapidly growing residential areas to the south. With continued growth, the community has experienced pressure on its transportation systems, its parks and open spaces, schools, and local utilities.

**PLANNING HISTORY**

**COUNTY PLANNING**

**1962 PIERCE COUNTY COMPREHENSIVE PLAN AND ZONING**

The first Pierce County Comprehensive Land Use Plan and the Pierce County Zoning Code were adopted in 1962. Zoning districts were established that dictated the appropriate location for commercial businesses and residential homes. However, the Plan did not offer much protection from incompatible uses and did not recognize the unique individuality of communities.

**1980 PARKLAND-SPANAWAY COMPREHENSIVE [COMMUNITY] PLAN**

The development of a new comprehensive plan for Parkland-Spanaway began in 1974. Parkland residents who were concerned about a Port of Tacoma proposal for an air freight terminal recognized that this issue and several other important land use questions needed to be resolved. Through the efforts of these citizens, the Board of Commissioners appropriated a budget for the development of a comprehensive plan.

In 1976, a citizens’ group called the Parkland-Spanaway Citizens’ Advisory Committee (CAC) was formed. This group was tasked to develop and foster community awareness and support for the plan. Over a three-year period, the CAC met on a regular basis to develop the basic goals, objectives, and recommendations, as well as the overall philosophy contained within this plan.
The Parkland-Spanaway Comprehensive [Community] Plan was adopted by Pierce County in 1980. In addition to the Parkland and Spanaway communities, the plan also included the Midland and North Clover Creek/Collins communities. In 1982, the Parkland-Spanaway Zoning Regulations were adopted by Pierce County. In 1983, the Midland area was removed from the control of the 1980 plan and 1982 regulations and reverted to the control of the 1962 Pierce County Comprehensive Plan and Zoning Code.

**1994 PIERCE COUNTY COMPREHENSIVE PLAN**

The Growth Management Act (GMA) was passed by the Washington State Legislature in 1990. It required Pierce County to update its existing Comprehensive Plan and Development Regulations including existing Community Plans such as Parkland-Spanaway’s. The GMA required Pierce County to develop and adopt a comprehensive plan which would control residential, commercial, and industrial growth.

In 1991, Interim Growth Management Policies were adopted as a transition between the 1962 Comprehensive Plan and the new plan required under the Growth Management Act. In 1992, the Pierce County County-Wide Planning Policies were adopted. The policies provided the framework and process by which Pierce County and the cities and towns within the County would establish urban growth areas, provide infrastructure and services, and preserve agricultural and natural resource lands.

In 1994, per the requirements of the Washington State Growth Management Act, Pierce County adopted a new Comprehensive Plan. The 1994 Pierce County Comprehensive Plan replaced the 1962 Pierce County Comprehensive Plan in its entirety. The plan established population projections, urban growth areas, and rural areas. The 1980 Parkland-Spanaway Comprehensive [Community] Plan remained in effect as a component of the new Comprehensive Plan, but many aspects of the 1980 plan were not consistent with the new County Comprehensive Plan and consequently were superseded by the new countywide plan and implementing Development Regulations-Zoning that became effective in July 1995.

**COMMUNITY PLANNING**

Although the Growth Management Act does not require comprehensive plans to provide for community plans, Pierce County Ordinance 90-47S directs County officials to prepare a community plans element of the Comprehensive Plan. The majority of unincorporated County residents live in community plan areas. Community plans must be consistent with the Comprehensive Plan and the GMA.

The community plans element of the 1994 Pierce County Comprehensive Plan envisions a local voice in how the Comprehensive Plan and its Development Regulations will be carried out in communities. This element provides the flexibility for communities to refine comprehensive plan land use designations and associated densities and make decisions about specific design standards that should apply in community planning areas. Preserving and building community character while ensuring an efficient and predictable development approval process is a central theme.
SCOPE OF THE COMMUNITY PLAN

LEGISLATIVE AUTHORITY TO DEVELOP THE PLAN

In the community plans element of the 1994 Pierce County Comprehensive Plan, the Parkland-Spanaway-Midland area was identified as a community with an existing community plan that needed to be updated. In 1997, the Pierce County Council directed the Department of Planning and Land Services to update the 1980 plan.

At the request of residents, the County Council modified the boundaries of the 1980 plan area to include the Midland area and remove the North Clover Creek/Collins and west Frederickson areas. The process for updating the Parkland-Spanaway-Midland Communities Plan began in 1998 through the efforts of the Community Planning Boards and four committees (Commercial and Industrial Character and Economic Development (CICED), Natural Environment, Water Resources, Parks and Open Space (NEWPOS), Residential Areas (RAC), and Transportation).

PURPOSE OF THE COMMUNITY PLAN

The Parkland-Spanaway-Midland Communities Plan gives the residents, businesses, property owners, and the County a clearer, more detailed sense of how the communities want to develop in the future and what standards could be utilized to create and maintain the look and feel identified in the communities plan. The Parkland-Spanaway-Midland Communities Plan will accomplish the following:

- Develop an area-wide vision for the entire Parkland-Spanaway-Midland region of Pierce County;
- Retain policies and actions from the 1980 communities plan that remain relevant today;
- Develop additional policies and actions that reflect the needs, concerns, and desires of the region and communities today;
- Refine the Pierce County Comprehensive Plan to more closely reflect the desires of the communities while making sure that what the communities desired would still fit well with the big picture for all of Pierce County in terms of countywide policies; and
- Identify actions necessary to implement the communities plan, including: adopting or revising land use regulations; identifying priorities for use of public funds to develop physical improvements, such as sidewalks, street landscaping, street lights, water-related improvements, and park development; social programs; economic programs, etc.

CONSISTENCY WITH THE 1994 PIERCE COUNTY COMPREHENSIVE PLAN

The goals, objectives, principles, and standards in the Parkland-Spanaway-Midland Communities Plan are consistent with the provisions in the Pierce County Comprehensive Plan. Although the communities plan proposes to change land use designations within the area, most of the proposed designations are already defined and policy direction is included in the County Comprehensive Plan. New designations have countywide applicability and associated policy
direction will be added to the Comprehensive Plan. The plan does propose new zoning districts to implement the existing land use designations which are also consistent with existing Comprehensive Plan designations and policies.

PUBLIC INVOLVEMENT

Development of the plan incorporated a variety of public involvement strategies including the formation of Community Planning Boards and committees, public workshops and open houses, and various surveys. These public involvement techniques ensure that the plan is developed as a representation of the general will and values of the community.

COMMUNITY PLANNING BOARDS AND COMMITTEES

COMMUNITY PLANNING BOARDS

The development of the Parkland-Spanaway-Midland Communities Plan could not have been accomplished without the Parkland, Spanaway, and Midland Community Planning Boards (CPBs). Each CPB, appointed in 1998, consisted of a fifteen-sixteen member group representing a variety of interests and geographic locations of the community.

The CPBs were charged with the following responsibilities: 1) serving as a sounding board for the community; 2) developing a vision and goals for the community plan area; 3) working with subcommittees in developing policies and implementing actions related to various topics; 4) guiding the development of policies and map changes that address community concerns while remaining consistent with the Comprehensive Plan; and 5) forwarding a recommended updated Parkland-Spanaway-Midland Communities Plan to the Pierce County Planning Commission and Pierce County Council.

COMMUNITY PLAN COMMITTEES

Four committees were formed to address the following topic areas: Commercial and Industrial Character and Economic Development (CICED); the Natural Environment, Water Resources, Parks and Open Space (NEWPOS); Residential; and Transportation. The role of each committee was to work with staff in researching and developing detailed policies and implementing actions related to the visions adopted by the CPB; and to forward draft policy and implementing actions to the CPB for review and approval.

OPEN HOUSES AND WORKSHOPS

GARFIELD STREET REVITALIZATION WORKSHOPS

In 1997, two workshops were held to gather public input for the development of a revitalization plan for the Garfield Street neighborhood. While this planning effort never resulted in the development of a formal plan, the information and ideas gathered from these two workshops were considered and, in some cases, incorporated in the commercial policies of this plan.
VISIONING WORKSHOPS

Three visioning workshops were held in March 1998, one in each of the communities in the plan area. These workshops were designed to check whether the visions from the 1980 Community Plan were still valid and, if not, how the plan should be changed.

The vision statement from the original 1980 Parkland-Spanaway Comprehensive [Community] Plan was revised by the Parkland, Spanaway, and Midland Community Planning Boards (CPBs) with significant input from the broader community through community workshops and surveys. This updated vision statement was used as the framework for the development of the communities plan. The vision statement was used by the Community Planning Boards to ensure that the detailed policies and implementation steps developed by committees of the CPBs were compatible with the values, needs, and hopes for the overall community.

BUSINESS ROUNDTABLE

In August 1998, a small focus group composed of long-term business people and property owners along the Pacific Avenue corridor was convened. The intent of the meeting was to gather insight from business people with a history of successfully making a living along Pacific Avenue. The group was asked a variety of questions designed to elicit responses on issues such as obstacles and opportunities for business success within the area, desired infrastructure improvements and potential funding sources for these improvements, and building design and sign standards.

SURVEYS

1998 COMMUNITY SURVEY

In 1998, a survey was distributed throughout the community to solicit input on a variety of issues such as perceived quality of life, adequacy of facilities and services within the plan area, quality of the natural environment, and location and intensity of residential, commercial, and industrial uses. The 1998 community survey was not mailed out to a representative sample of the population; therefore, its results are not statistically viable as a reflection of the views of the majority of Midland, Parkland, or Spanaway residents. However, this survey does serve as a snapshot of community values and preferences within the communities plan area, as well as within the individual communities. In addition, the 1998 results were compared against the statistically viable 1976 attitude survey conducted for the 1980 Community Plan as a method to indicate how opinions have changed in the past 22 years.

BUSINESS SURVEY

In the summer of 1998, a survey targeted towards business owners in the communities plan area was mailed out. The business survey questions were designed to elicit information about: 1) business longevity and stability; 2) factors that influence business location patterns; 3) business needs for access, parking, and signage; 4) elements that pose obstacles to the success and growth of businesses; and 5) support for creation of a business improvement district.
**TELEPHONE INTERVIEWS WITH COMMERCIAL/INDUSTRIAL REAL ESTATE AGENTS**

In August 1998, staff conducted telephone interviews with the local real estate community to seek input on factors that influence the marketability of commercial and industrial properties located within the Parkland-Spanaway-Midland Communities Plan area. Ten agents were interviewed with expertise in selling commercial/industrial real estate ranging from 10 to 28 years with a combined average of 19 years of experience.

**VISION STATEMENT**

This vision statement describes a common understanding of character and appearance of the community that we desire to establish using the policies, regulations and standards contained in the Parkland-Spanaway-Midland Communities Plan. This statement should be used to determine intent and to provide context when interpreting the provisions of the plan.

We envision a community where:

- Commercial and residential areas are visually pleasing and reflect compatible land use.
- Traffic flows smoothly and safely.
- Streetside landscaping is prevalent and complimentary to adjacent properties.
- Children can safely walk to school.
- Building and street design helps create quality neighborhoods.
- The local government responds to common concerns and values of the citizens.
- Enough parks and playgrounds to meet our needs.
- Public and privately owned active and passive recreation facilities are available for all ages.
- Alternate forms of transportation are encouraged and accommodated.
- Public access and use of publicly owned waterfront on Spanaway Lake is managed for maximum public benefit.
- Natural areas enhance the quality of life by providing visual relief, noise reduction, wildlife habitat, separation of incompatible land uses, and flood control.
- A variety of housing is available to serve different income levels.
- Public and private development and investment efforts are coordinated to provide employment opportunities within the community.
Chapter 2: Land Use Element

Introduction

The Land Use Element of the Parkland-Spanaway-Midland Communities Plan provides direction regarding the location and intensity of land uses within the plan area. This element is intended to supplement and further refine the Land Use Element of the Pierce County Comprehensive Plan. Where the communities plan provides specific guidance regarding land uses, the policy language of this plan will govern. Where the communities plan does not provide specific guidance, the reader is directed to utilize the land use objectives, principles, and standards of the Pierce County Comprehensive Plan.

The Land Use Element addresses the location and intensity of commercial, industrial, residential, and civic land uses. The element contains several main components: goal statements; objectives, principles, and standards for each land use concept and land use type (commercial/industrial, residential, and civic); and regulatory and non-regulatory implementing actions.

Description of Current Conditions

The following information provides background information on the existing land use designations and zoning classifications, land development patterns, population, and housing in the plan area. This information and that found in the demographics summary provide the basis for analysis of existing or planned conditions and the development of new and revised policy and regulatory measures.

Inventory of Existing Land Uses

An inventory of existing land uses was conducted for the plan area in July 2001. Using the Pierce County Assessor-Treasurer's data for each tax parcel, information was gathered on current uses, acreage, and ownership. This inventory reflects how land within the plan area is currently being utilized. Table I-1 summarizes existing land uses within the urban growth area, and Map I-2: Historic Assessed Land Uses illustrates the location of these uses.

### Current County Comprehensive Plan Land Use Designations and Zoning Classifications

Map I-1: Land Use Designations assigns eight land use designations to the plan area. These land use designations are: Moderate Density Single-Family, High Density Residential District, Activity Center, Community Center, Employment Center, Mixed Use District, Master Planned Community, and Reserve 10. These land use designations are implemented by zoning classifications that are identical to the land use designations in name, location, and function. Table I-2 indicates the number of acres of land within the plan area that are currently in each land use designation/zoning classification. Map I-3: Historic Land Use Designations/Zoning illustrates the location of each of these land use designations/zoning classifications.

MODERATE DENSITY SINGLE-FAMILY
The Moderate Density Single-Family (MSF) land use designation/zone classification is intended to provide areas for urban single-family and two-family residential development at densities of 2-6 dwelling units per acre. The MSF designation is the dominant land use designation in the plan area. Approximately seventy-eight percent of the plan area (10,040 acres) is designated as MSF.

HIGH DENSITY RESIDENTIAL DISTRICT
The High Density Residential District (HRD) is intended to provide areas of multifamily and high density single-family housing and limited neighborhood commercial retail and service uses along major arterial roadways and transit routes which are linked to an urban center. There are two areas within the plan area that are HRD. These areas are located at the intersections of 8th Avenue East/176th Street East and 22nd Avenue East/176th Street East in Spanaway.

ACTIVITY CENTER
The Activity Center (AC) designation has as its focus a recreational, cultural, or educational activity around which develops a concentration of commercial, office, or high density residential development. There are two areas within the plan area that are classified/designated as AC. These AC areas are found in the Garfield Street neighborhood on the eastern edge of Pacific Lutheran University and in the vicinity of Sprinker Recreation Center/Spanaway Park/Lake Spanaway Golf Course at Military Road/152nd Street and Pacific Avenue.

COMMUNITY CENTER
The Community Center (CC) designation has a significant retail complex around which develops a concentration of other commercial office services and some high density residential development. The intersection of 176th Street and Pacific Avenue is the only area within boundaries of the communities plan that is designated as CC.

MIXED USE DISTRICT
The Mixed Use District (MUD) designation provides for auto-oriented commercial and land intensive commercial uses along major arterials, state highways, and major transit routes. The MUD designation also contains multifamily residential uses. The MUD designation is the second most prevalent land use designation/zone classification within the plan area and the dominant designation along the Pacific Avenue/Mountain Highway corridor, 112th Street east of Pacific Avenue, and portions of Portland Avenue and 72nd Street.

EMPLOYMENT CENTER
The Employment Center (EC) designation provides land for industrial, manufacturing, and office jobs to serve the needs of the community. Uses in the EC range from land intensive heavy industrial (e.g., manufacturing, product assembly, fabrication, processing, and heavy trucking uses) to light manufacturing, assembly, and wholesale activities to corporate office and office
park development. Commercial uses subordinate to and supportive of employment uses are also permitted. The EC designation is currently located along the Steele Street corridor at the northeast edge of McChord Air Force Base.

**MASTER PLANNED COMMUNITY**

The Master Planned Community (MPC) designation is intended to be a way to achieve well designed, compact, urban development with a balance of uses, more efficient use of public facilities, and a greater amount of open space than would be required under standard development. MPCs integrate a mix of housing, services, and recreation and are approved through a planned unit development or planned development district process. Densities in a MPC must average between 4-10 dwelling units per acre, with individual densities within the community ranging from 2-25 dwelling units per acre. MPCs must encompass a minimum of 320 acres. The only MPC in the plan area is Hidden Village, located at 8th Avenue and Mountain Highway.

**RESERVE 10**

Reserve 10 (RSV 10) is a rural land use designation that permits residential densities of one home per ten acres. The designation notes the areas into which the Urban Growth Area will likely expand in the future in response to capacity needs. Lands designated as RSV 10 are located in the southern tip of the plan area near the intersection of 208th Street East and 22nd Avenue East.

**DESCRIPTION OF DESIRED CONDITIONS**

One of the most significant issues addressed within the community plan process is land use. How land is utilized within a community directly affects the community's character and the quality of life perceived by its residents. The utilization of land also directly influences many other planning considerations, including but not limited to transportation system planning, provision of water and sewer infrastructure, and protection of the natural environment. In regard to land use, the citizens of the Parkland, Spanaway, and Midland communities have reviewed the Pierce County Comprehensive Plan in light of the existing conditions present in these communities. This review has identified a series of modifications that should be made to the Pierce County Comprehensive Plan to assure that this plan accurately reflects the needs and desires of these communities. These modifications include changes to the name of the Urban Neighborhood land use designation, a provision to allow densities below two dwelling units per acre, the addition of new zoning classifications within the plan area and the adoption of a series of new land use related policies.

**LAND USE DESIGNATIONS AND ZONING CLASSIFICATIONS**

The communities plan proposes to modify the range of land use designations that would apply within the plan area. Seven land use designations are proposed. These designations are: Moderate Density Single-Family, High Density Residential District, Community Center, Activity
Center, Neighborhood Center, Employment Center, and Mixed Use District. These designations are the same as those currently identified in the Pierce County Comprehensive Plan. The Master Planned Community and Reserve 10 designations would no longer apply within the plan area.

The range of zoning classifications that implement the various land use designations would be expanded. Currently, eight zoning classifications apply within the plan area. The number of zoning classifications would increase to fourteen under the proposed communities plan. This increase in the number of zoning classifications reflects the communities’ desire to more closely manage the location, type and intensity of land uses that occur. For example, currently the Moderate Density Single Family (MSF) land use designation is implemented by one zoning classification - the Moderate Density Single Family zone. This zone allows for one and two family dwellings at a density range of two to six dwelling units per acre in all areas designated as MSF. The proposed communities plan, however, proposes three different zoning classifications based upon neighborhood and environmental characteristics to implement the MSF designation. These new zoning classifications more closely control density and housing types.

Table I-3 indicates the total acres of land proposed with each land use designation. Map I-1: Land Use Designations illustrates the location of each of these land use designations. Table I-4 indicates the acreage of the various zone classifications within each land use designation.

</table>
The communities plan retains the Moderate Density Single-Family (MSF) designation as the dominant land use designation within the plan area. This designation identifies areas designated for single-family or two-family dwellings. Multifamily housing, commercial, or industrial uses are prohibited. Specific densities are based on existing densities, physical constraints, and the availability of urban services such as sewers.

**Implementing Zones**

The Moderate Density Single-Family plan designation will be implemented by three zoning classifications: Moderate Density Single/Two-Family (MSF), Single-Family (SF), and Residential Resource (RR).

The MSF zone that is proposed by the communities plan is essentially the same as Pierce County’s current MSF zone classification. The primary land use allowed within this classification is moderate density one and two family housing and compatible civic uses. The principal change in this zone classification is that the minimum density has been increased from two dwelling units per acre to four dwelling units per acre. The maximum density for the zone (six dwelling units per acre) remains unchanged. The name of the zone is also being modified to add "/Two" to more accurately reflect its purpose.

The Single-Family (SF) zone classification is a new classification intended to provide for residential areas that are less dense and more homogenous that those developed under the MSF zone. The primary land use allowed within this classification is low to moderate density...
single-family activities and compatible civic uses. The SF zone permits a density of two to four dwelling units per acre. Single-family housing is the primary housing type that is permitted. Duplexes and other multiple family housing types are prohibited.

The Residential Resource (RR) zone classification is a new classification intended to provide for low density single-family residential uses in a manner that is compatible with areas of unique open space character or environmental sensitivity. The zone classification would be the least intensive of Pierce County’s urban zones, permitting a density of one to three dwelling units per acre. In addition to the lower density range, special standards relative to environmental protection (reduced impervious coverage, vegetation retention, etc.) would also apply.

### HIGH DENSITY SINGLE-FAMILY DESIGNATION

Higher density single-family development is encouraged in the High Density Single-Family designation to expand the variety of housing types and choices available while maximizing the utilization of existing infrastructure within the urban growth area.

### IMPLEMENTING ZONES

The High Density Single-Family (HSF) zone classification is a new classification intended to provide for single-family detached residential uses with all entry on the first floor, at densities ranging from 6 to 12 dwelling units per acre.

### HIGH DENSITY RESIDENTIAL DISTRICT DESIGNATION

The High Density Residential District (HRD) designation will continue to apply within the communities plan area. The HRD is intended to be composed of multifamily and high density single-family and two-family housing and limited neighborhood retail and service commercial uses.

### IMPLEMENTING ZONES

The High Density Residential District (HRD) plan designation will be implemented by two zone classifications: Residential/Office-Civic (ROC), and Moderate High Density Residential (MHR).

The ROC zone would permit the same general range of land uses as the MHR zone, but at lower densities. The ROC zone permits a density range of eight to twenty-five dwelling units per acre. Moderate and high density single-, two-, and multifamily housing and compatible civic and office uses and limited neighborhood retail and service commercial are the primary uses permitted in the ROC zone. The ROC classification provides a transition between Commercial and Employment Centers and Mixed Use Districts and surrounding moderate and low-density residential neighborhoods. It generally applies to areas where there is a clearly moderate to high density residential character but with a noticeable and compatible office or commercial service and commercial retail presence. Development in this classification is to have a pedestrian-oriented character.

The MHR zone differs from Pierce County’s current HRD zone in that it does not allow for commercial uses. The MHR zone permits high density single-, two-, and multifamily housing
and compatible civic uses. The residential density range for this zone is eight to twenty-five dwelling units per acre. Areas zoned MHR are located primarily along major arterial roadways, state highways, and major transit routes that connect to Urban Centers and Mixed Use Districts or serve as transitions between centers, districts, and residential neighborhoods.

<table>
<thead>
<tr>
<th>Community Center Designation</th>
</tr>
</thead>
<tbody>
<tr>
<td>The Community Center land use designation will continue to apply within the communities plan area. The primary role of a Community Center is to be the center for general purpose, pedestrian-oriented shopping activity in the communities and surrounding neighborhoods. Within the communities plan area, there are three commercial neighborhoods designated as Community Center: the Pacific Avenue/176th Street neighborhood, Pacific Avenue/131st Street neighborhood, and the Mountain Highway/8th Avenue neighborhood.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Implementing Zones</th>
</tr>
</thead>
<tbody>
<tr>
<td>The Community Center plan designation will continue to be implemented by the Community Center (CC) zone classification, as well as three new zone classifications; Residential/Office-Civic (ROC) and Moderate High Density Residential (MHR). The CC zone is nearly identical to Pierce County's current CC zone classification. Residential densities and setbacks are the same. The range of land use permitted in the zone is generally the same, with a few minor modifications. The ROC, and MHR zones are discussed under the High Density Residential District land use designation above.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Activity Center Designation</th>
</tr>
</thead>
<tbody>
<tr>
<td>The primary role of Activity Centers is to serve as the civic center of the community. Within the communities plan area, there are two commercial neighborhoods which fit the role of an Activity Center: 1) the Garfield Street neighborhood and 2) the Spanaway Park neighborhood.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Implementing Zones</th>
</tr>
</thead>
<tbody>
<tr>
<td>The Activity Center (AC) plan designation will be implemented by the Activity Center zone classification. The major distinction of the PSM Activity Center classification is encouraging more pedestrian-oriented activities. Another feature of the AC zone is that multifamily uses are permitted only as a second-story component of a mixed use development.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Neighborhood Center Designation</th>
</tr>
</thead>
<tbody>
<tr>
<td>The primary role of the Neighborhood Center is to serve as the commercial and social center of the neighborhood. Within the communities plan area, there are three commercial neighborhoods which fit the role of a Neighborhood Center: 1) the Portland Avenue/99th Street neighborhood; 2) the 112th Street/Park Avenue/C Street neighborhood; and Park Avenue South and 162nd Street neighborhood.</td>
</tr>
</tbody>
</table>
**IMPLEMENTING ZONES**

The High Density Residential District (HRD) plan designation will be implemented by two zone classifications: Residential/Office-Civic (ROC), and Moderate High Density Residential (MHR).

---

**MIXED USE DISTRICT DESIGNATION**

The primary role of the Mixed Use Districts (MUDs) is to serve as the focus of auto-oriented commercial activity in the three communities. Mixed Use Districts have a loosely defined sense of place, are auto-oriented or auto/pedestrian-friendly neighborhoods, with transit-friendly features, and with use characteristics which vary in intensity from low to moderate to high. Mixed Use Districts are generally located between pedestrian-oriented commercial centers or Employment Centers.

Mixed Use Districts are areas of mixed commercial retail, service, office, and some high density residential uses, where single trip, auto-oriented and auto-dependent businesses dominate. Mixed Use Districts are characterized by individual businesses on separate lots with separate access and parking lots.

Within the communities plan area, there are eight commercial neighborhoods which fit the role of a Mixed Use District: 1) the 72nd Street neighborhood (McKinley Avenue to east of Golden Given Road); 2) the north Portland Avenue neighborhood (72nd to north of 80th Street); 3) the north Parkland/Pacific Avenue neighborhood (96th Street to SR 512); 4) the Central Parkland/112th Street/Pacific Avenue neighborhood; 5) the South Parkland/Pacific Avenue neighborhood (127th to 140th Street); 6) the Central Spanaway/Pacific Avenue neighborhood (159th to 173rd Street); 7) the 8th Avenue/Mountain Highway neighborhood; and 8) the 22nd Avenue/Mountain Highway neighborhood.

---

**IMPLEMENTING ZONES**

The Mixed Use District plan designation will be implemented by the Mixed Use District (MUD) zone classification, as well as the Commercial Mixed Use District (CMUD), Office-Residential Mixed Use District (OMUD), and Residential/Office-Civic (ROC) zone classifications.

The primary role of the Commercial Mixed Use District (CMUD) classification is to identify those portions of the Mixed Use District designation appropriate for general purpose, auto-oriented and auto-dependent commercial and civic activities. Commercial Mixed Use Districts have the same characteristics as MUDs. Residential development shall be permitted in the CMUD classification only in conjunction with a mixed use development where non-residential uses are focused on the ground floor.

The primary role of the Office-Residential Mixed Use District (OMUD) classification is to identify those portions of the Mixed Use District designation best suited to auto-oriented commercial office, service, and civic uses

The ROC zone is discussed under the High Density Residential District land use designation above.
EMPLOYMENT CENTER DESIGNATION

The role of Employment Centers (ECs) is to provide for areas in the communities where industrial, research, and office park development is encouraged to locate. Within the communities plan area, the following neighborhoods lend themselves to be Employment Centers: 1) the south Portland Avenue neighborhood; 2) the Steele Street neighborhood; 3) the north Parkland/A Street neighborhood; 4) the south Pacific Avenue neighborhood; 5) the north Mountain Highway corridor neighborhood; and 6) the south Mountain Highway corridor neighborhood.

IMPLEMENTING ZONES

The Employment Center plan designation will be implemented in the communities plan area by two new zone classifications: Community Employment (CE) and Research-Office (RO).

The role of the Research-Office (RO) classification is to provide for areas in the communities where low to moderate intensity research activities or office park development may locate. The role of the Community Employment (CE) classification is to provide for areas in the communities where low to moderate intensity industrial activities (manufacturing, assembly, warehousing, and industrial services), research activities, or office park development may locate.

LAND USE POLICIES

GOALS

The following statements comprise a general land use goal which will be used to guide the development of more specific goals and standards throughout the communities plan Land Use Element:

- Uses should locate in those areas where sufficient infrastructure and services exist or can be readily and economically provided;
- Higher intensity uses should locate in areas where impacts on adjacent lower intensity uses and natural systems would be minimal. The intensity of an allowed use should be proportional to the ability of such use to mitigate its impacts on its surroundings; and
- Uses should be designed and located to allow for sufficient areas in the community for low, moderate, and high intensity development.

The following statements comprise the goal for commercial and industrial character and development in the Parkland-Spanaway-Midland Communities Plan:

- Commercial development, designed and scaled to serve the needs of residents within the boundaries of the communities plan and those in nearby communities, should be concentrated along the Pacific Avenue/Mountain Highway and 72nd Street corridors, where existing or planned placement of public facilities, utilities, and services can support such development in an efficient manner;
• Commercial development, designed and scaled to serve the needs of neighborhoods primarily within the boundaries of the communities plan, should be concentrated in pedestrian-oriented commercial centers along portions of Portland Avenue and 112th Street where existing or planned placement of public facilities, utilities, and services can support such development in an efficient manner;

• Commercial and industrial development should be allowed to occur only when adequate public facilities and services are available and the carrying capacity of the natural environment is not exceeded;

• Groupings of compatible commercial and civic uses of various individual intensities should be concentrated in moderate and high intensity pedestrian-oriented commercial centers along the Pacific Avenue/Mountain Highway corridor;

• Individual uses of various individual intensities should be located in auto-oriented and auto/pedestrian-friendly commercial corridors along Pacific Avenue/Mountain Highway, between moderate intensity and high intensity pedestrian-oriented commercial centers and employment centers. The architectural and site design characteristics of auto-oriented and auto/pedestrian-friendly uses shall serve to enhance the aesthetic character of the Pacific Avenue/Mountain Highway corridor;

• Residential and civic uses should separate commercial centers along Portland Avenue and 112th Streets;

• Low and moderate intensity commercial development should be allowed to occur where adequate separation, buffering, and sensitive placement of buildings and parking can make such development compatible with adjacent residential neighborhoods;

• Development and redevelopment of low, moderate, and high intensity commercial areas should enhance the image and appearance of those areas and the overall community;

• Low intensity industrial activities which require convenient transportation access, have low employee densities, and cause minimal environmental impacts should be encouraged to remain or locate in proximity of the north end of McChord Air Force Base;

• Low and moderate intensity industrial activities should be limited to commercial centers and auto/pedestrian-friendly employment centers along the Pacific Avenue/Mountain Highway, A Street, Portland Avenue, and Steele Street corridors, where such uses are or can be made compatible with surrounding non-industrial uses through adequate separation, buffering, and sensitive placement of buildings and parking; and

• Strive to make nonconforming uses, nonconforming developments, nonconforming use of structures, and nonconforming use of land more compatible with existing and future conforming uses and development by: 1) restricting or prohibiting the expansion of nonconforming uses, depending upon the land use designation and the degree of consistency with the comprehensive and communities plans; and 2) increasing public involvement in review of any request to expand a nonconforming use, nonconforming development, nonconforming use of structures, and nonconforming use of land.

The following statements comprise the goal for residential character and development in the Parkland-Spanaway-Midland Communities Plan:
• The key to health, safety, a strong sense of community, and a high quality of life in the Parkland-Spanaway-Midland region is to preserve, maintain, and enhance existing residential neighborhoods, and develop and maintain new residential neighborhoods which provide a variety of well and sensitively designed and sited housing types, densities, and complementary land uses;

• The majority of the Parkland-Spanaway-Midland region should consist of medium density residential neighborhoods with recreational, commercial, professional, and other services of low, moderate, and high intensity in defined locations convenient to residents;

• Residential development should be allowed to occur only when adequate public facilities and services are available and the carrying capacity of the natural environment is not exceeded;

• The character of historically low density residential areas should be preserved, restored, and maintained;

• Areas with historically low residential densities, significant environmental constraints, or compatibility conflicts with adjacent military installations and industrial uses should be maintained with low urban densities; and

• Public and private facilities and services, which enhance and are compatible with the living environment of residents and are of an appropriate scale and design, may be integrated into residential neighborhoods.

COMMERCIAL/INDUSTRIAL

GOAL PSM LU-1 Commercial centers shall be focused around key intersections in transportation corridors that serve one or more neighborhoods or communities and provide a people place as well as a commercial focus for businesses along the corridor.

PSM LU-1.1 In new development and redevelopment, incorporate substantial landscaping, both along street frontages and within parking lots.

GOAL PSM LU-2 Ensure that all new development and redevelopment in the commercial centers reflects the unique character of each center.

PSM LU-2.1 Development codes shall be revised as needed to recognize the historic uniqueness of certain centers, including the Garfield Street Activity Center, through appropriate performance standards, design standards and guidelines, and other measures.

PSM LU-2.2 The commercial centers along the Pacific Avenue/Mountain Highway corridor shall be comprised of a mixture of uses consistent with each center’s role as a pedestrian-oriented gathering place for the Parkland and Spanaway communities and the broader central Pierce County area.

PSM LU-2.3 The commercial centers along the Portland Avenue corridor shall be comprised of a mixture of uses consistent with each center’s role as a pedestrian-oriented gathering place for the Midland community.
GOAL PSM LU-3  Develop parking programs for the commercial centers which recognize and support the area’s historic or planned pedestrian character, while providing sufficient parking for customers of all businesses.

PSM LU-3.1  Pierce County shall work with the business community in public/private partnerships to develop a coordinated and effective approach to providing adequate parking and circulation within the centers.

PSM LU-3.2  A comprehensive study of parking, transit, and nonmotorized transportation needs of each commercial center shall be made to determine the most efficient method of meeting the unique demands of the area and the role of the public and private sectors in accommodating the demands.

PSM LU-3.3  The development of parking lots open to the general public shall be guided by a parking plan for each commercial development.

PSM LU-3.4  Parking policy for a center shall balance the impact of parking on each center’s pedestrian character, economic development, and transit usage.

PSM LU-3.5  Explore greater use of road rights-of-way as a method to increase parking in pedestrian-oriented commercial neighborhoods.

PSM LU-3.6  Some flexibility in the general parking requirements of the Pierce County Development Regulations may be necessary to accommodate re-use of existing buildings and to accommodate new development or redevelopment, given the pattern of existing development in centers.

GOAL PSM LU-4  Provide for the orderly transition to other uses of older residential or commercial areas that are no longer viable for their original use, scale, or intensity of use.

PSM LU-4.1  Portions of arterials experiencing strong pressure for commercial development, but not yet committed to general commercial uses, shall be identified as areas for offices, professional services, non-auto-dependent commercial services, and moderate or high density residential uses. The Development Regulations shall promote the development of professional offices and similar uses along these arterials.

PSM LU-4.2  Residential arterials having good potential for long-term maintenance of a quality living environment shall be protected from the intrusion of commercial uses. In some instances, these may be appropriate locations for churches and other religious institutions, or moderate or high density residential uses.

GOAL PSM LU-5  Special location consideration shall be given to those manufacturing operations which are non-polluting of the environment.

PSM LU-5.1  Industries which handle hazardous or flammable materials shall be located away from residential areas and population concentrations.
**GOAL PSM LU-6**  
Preserve and enhance the role of the Garfield Street and Spanaway Park neighborhoods as the civic centers of the community and focal points for the broader area for governmental, educational, recreational, and cultural activities and businesses which support these activities, each with its own distinct image and character.

**PSM LU-6.1**  
A diversity of uses, including pedestrian-oriented commercial, civic, and mixed use residential uses, shall be encouraged. Allow moderate intensity, pedestrian-oriented commercial retail and service, entertainment, and office uses.

**PSM LU-6.2**  
Promote, expand, and enhance the recreational, cultural, civic, or educational attractions and pedestrian-oriented commercial experience offered by the Activity Center to increase the draw of residents of nearby communities and visitors.

**GOAL PSM LU-7**  
Promote the Garfield Street Activity Center as a compact, pedestrian-oriented, transit-friendly center.

**PSM LU-7.1**  
Promote creation of restaurants, art galleries, theaters, and other uses as a key component to the Garfield Street Activity Center.

**PSM LU-7.2**  
Commercial operations which are oriented to evening and drop-in services shall be encouraged to locate in the center.

**PSM LU-7.3**  
Within the Activity Center, new residential uses may exceed 25 units per acre as part of a mixed use development.

**GOAL PSM LU-8**  
Promote the Spanaway Park Activity Center as a pedestrian-oriented, transit-friendly center.

**PSM LU-8.1**  
Promote establishment of commercial businesses which complement the recreational activities of the public recreational facilities, e.g., Spanaway Park, Lake Spanaway Golf Course, and Sprinker Recreation Center.

**PSM LU-8.2**  
Pierce County shall work with owners of the Marymount property to encourage development of the property to accomplish the following objectives:

**PSM LU-8.2.1**  
Public display and appropriate maintenance or restoration of part or all of the Harold LeMay Car Collection;

**PSM LU-8.2.2**  
Selection of private development activities (e.g., retirement housing, offices, etc.) to enhance the opportunity for family wage jobs for community residents, and to be compatible in type and placement with surrounding residential and commercial neighborhoods;

**PSM LU-8.2.3**  
Incorporation of historic on-site structures or mature vegetation into future development, where feasible; and

**PSM LU-8.2.4**  
Use of portions of the property as a public or private sector gathering place for community residents and visitors.
PSM LU-8.3  Pierce County shall work with the owners of the Harold LeMay Car Collection, the Tacoma-Pierce County Chamber of Commerce, Tacoma-Pierce County Convention and Visitors Bureau, and others to assist in the siting, funding, development, and marketing of a facility for the display of part or all of the Harold LeMay Car Collection in the Parkland-Spanaway-Midland community, preferably on the site of the Marymount Academy in Spanaway.

PSM LU-8.4  Create a clearly defined entry into the Spanaway Park Activity Center from Pacific Avenue, Military Road, C Street, and 152nd Street through signage, landscaping, paving, and street furniture.

PSM LU-8.4.1  Pierce County Planning and Land Services shall work with the business community, the surrounding Spanaway community, Pierce County Parks and Recreation, Pierce Transit, and the WSDOT to develop a streetscape improvement plan for the Spanaway Park Activity Center.

PSM LU-8.4.2  The Spanaway Park Activity Center streetscape improvement plan shall address the following topics: public and private landscaping, sidewalk and crosswalk improvements, street furniture, signage, utility placement, funding sources, development priorities, etc.

COMMUNITY CENTER

GOAL PSM LU-9  Develop economically strong Community Centers, each with a distinct image and character, of bold architectural form, that provide for a mixture of commercial, civic, and residential uses, along with access to transit and public amenities, which will meet the general high intensity, pedestrian-oriented, auto-friendly shopping and service needs of community residents and the surrounding communities and will partially satisfy community housing needs.

PSM LU-9.1  The Community Centers shall continue to be recognized as the business focal points of the community.

PSM LU-9.2  A diversity of uses, including moderate and high density residential uses in appropriate locations, should be encouraged to maintain a vibrant, active, and competitive center for the community.

PSM LU-9.3  Support development of residential uses in the primarily commercial portions of Community Centers as a secondary component of a mixed use project to increase pedestrian activity within the neighborhood.

GOAL PSM LU-10  Promote the 176th Street Community Center as a compact pedestrian-oriented, auto-friendly commercial center focused toward providing general household goods, specialty goods, banking, professional, and commercial services.

PSM LU-10.1  Promote the development of residential uses in the 176th Street Community Center in portions of the center where they can serve as a transition between commercial areas and adjacent residential neighborhoods and to increase pedestrian activity within the neighborhood.
GOAL PSM LU-11  Promote the 8th Avenue Community Center as a compact pedestrian-oriented, auto-friendly commercial center focused toward providing general household goods, specialty goods, banking, professional, and commercial services to the surrounding Spanaway community, and to those in other communities passing through the center, given its location along Mountain Highway.

NEIGHBORHOOD CENTER

GOAL PSM LU-12  Provide needed products and services to neighborhood residents in a convenient, recognizable, compact, pedestrian-oriented location, while protecting existing and future residential neighborhoods from the disruptive effects of commercial intrusions.

PSM LU-12.1  Neighborhood Centers shall be prevented from spreading along the arterials that serve them through clear Comprehensive Plan criteria for expansion.

PSM LU-12.2  In neighborhood commercial developments, harmoniously reflect the scale and architectural details of the surrounding residential structures and require nonmotorized access.

PSM LU-12.3  Promote the development of residential uses in portions of Neighborhood Centers where they can serve as a transition between commercial areas and adjacent residential neighborhoods and increase pedestrian activity within the Neighborhood Center.

PSM LU-12.4  Support development of residential uses in the primarily commercial portions of Neighborhood Centers as a secondary component of a mixed use project to increase pedestrian activity within the neighborhood.

PSM LU-12.5  Through use of signage, landscaping, paving, and street furniture, create a clearly defined entry into: the 99th Street Neighborhood Center from 99th Street and Portland Avenue; and the 112th Street Neighborhood Center from 112th and C Streets and Park Avenue.

MIXED USE DISTRICT

GOAL PSM LU-13  Promote Mixed Use Districts as areas with cohesive identities which are attractive, safe, functional, diverse, and profitable auto-oriented places to live, do business, shop, and work.

PSM LU-13.1  Promote portions of the various Mixed Use Districts as auto-oriented commercial areas focused toward providing large household goods, automobile-related and dependent products and services, and single-purpose professional services.

PSM LU-13.2  Mixed Use Districts will convey a positive reflection of the community as a whole, and of the surrounding residential and business neighborhoods in particular.

PSM LU-13.3  MUDs are corridors in which buildings, parking, and plantings are prominent and uses are oriented to transit and automobiles.
In new development and redevelopment, incorporate substantial landscaping, both along street frontages and within parking lots.

Encourage the development of corridor focal points, while ensuring high quality architectural design.

Encourage the appropriate use of areas adjacent to heavily traveled arterials while minimizing land use and traffic conflicts.

Pierce County shall identify those arterials that are appropriate for continued or future office and service commercial development, mixed use development (retail, service and office commercial, and residential), and moderate and high density residential development.

Residential uses shall be permitted except on the ground floor where commercial retail shall be the dominant use.

Pierce County shall work with Pierce Transit, WSDOT, and Pierce County Public Works and Utilities to develop a transit and a pedestrian and bicycle system that allows for safe and convenient movement through the Pacific Avenue, Mountain Highway, Portland Avenue, 112th Street, and 72nd Street corridors and encourages movement by bus.

Promote the establishment of low and moderate intensity industrial, research, and office activities in Community Employment Centers (CECs) along the Pacific Avenue, Portland Avenue, A Street, Mountain Highway, and Steele Street corridors.

Locate where such uses are or can be made compatible with surrounding non-industrial uses through adequate separation, buffering, and sensitive placement of buildings, loading areas, materials storage, and parking.

CECs will have cohesive identities and will be attractive, safe, functional, diverse, and profitable places to work and do business, and are a positive reflection of the community as a whole.

Low and moderate intensity industrial manufacturing, research, office, industrial service, and warehousing uses and activities shall be promoted where they provide local needed services, increase local employment opportunities, and where environmental impact on surrounding uses can be mitigated.

Retailing of goods and services shall be limited to bulk commodities and large items requiring on-site warehousing (e.g., building materials, commercial equipment, and supplies).

All developments on the periphery of the industrial area shall be designed, screened, bermed, or other means implemented to mitigate undesirable impacts upon surrounding areas.
RESIDENTIAL

GOAL PSM LU-16  The permitted residential densities shall discourage urban sprawl throughout the plan area.

PSM LU-16.1  The density of new residential growth shall be a minimum of 4 dwelling units per acre (net) throughout the overall plan area.

PSM LU-16.2  Residential areas where substantial environmental constraints exist shall develop at densities of 1 to 3 dwelling units per acre within the Residential Resource zone.

PSM LU-16.3  New residential growth in established single-family neighborhoods shall develop at densities of 4 to 6 dwelling units per acre.

PSM LU-16.4  New residential growth in areas that serve as a transition between commercial centers and districts and employment centers and single-family neighborhoods shall develop at densities between 4 and 12 dwelling units per acre.

PSM LU-16.5  New residential growth within commercial centers and districts shall develop at densities of 8 to 25 dwelling units per acre.

MODERATE DENSITY SINGLE-FAMILY

GOAL PSM LU-17  Residential densities in the Moderate Density Single-Family (MSF) designation should vary depending on the natural constraints, the type of development, proximity to facilities and services, and surrounding densities.

PSM LU-17.1  Non-residential development within the Moderate Density Single-Family designation shall be limited to specified civic, resource, and utility uses and Essential Public Facilities.

PSM LU-17.2  Attached single-family housing units within the MSF zone shall be limited to triplexes and fourplexes and permitted only by conditional use permit.

PSM LU-17.2.1  Attached single-family units shall have ground level access to each unit unless architecturally designed to appear as a single-family dwelling.

PSM LU-17.3  Allow community gardens and small-scale hobby farms when farm management plans are utilized within the Residential Resource zone.

PSM LU-17.4  Duplexes should be prohibited in the SF and RR zones and allowed in the MSF zone.

GOAL PSM LU-18  Establish new residential zoning classifications that allow for variations in density within the Moderate Density Single-Family land use designation.

PSM LU-18.1  The Moderate Density Single-Family (MSF) zoning classification shall allow a minimum density of 4 dwelling units per acre and a maximum density of 6 dwelling units per acre.

PSM LU-18.2  The Single-Family (SF) zoning classification shall allow a minimum and maximum density of 4 dwelling units per acre.
PSM LU-18.2.1 Single-family attached and two-family units shall be prohibited.

PSM LU-18.3 The Residential Resource (RR) zoning classification shall allow a minimum density of 1 unit per acre when environmental constraints are present and a maximum density of 3 dwelling units per acre.

GOAL PSM LU-19 The following characteristics shall be used when applying Residential Resource (RR) zone classification:

PSM LU-19.1 Substantial environmental constraints, (e.g., wetlands, steep slopes).
PSM LU-19.2 Connects identified open space corridors.

GOAL PSM LU-20 The following characteristics shall be used when applying the Single-Family (SF) zone classification:

PSM LU-20.1.1 Established single-family residential neighborhoods with a minimum number of two-family and attached single-family dwelling units; and

PSM LU-20.1.2 A desire to maintain low densities in keeping with existing neighborhoods.

GOAL PSM LU-21 The following characteristics shall be used when applying the Moderate Density Single-Family (MSF) zone classification:

PSM LU-21.1.1 Located within a distance of 1,500 feet from the High Density Residential, Mixed Use District, Community Center, Activity Center, Neighborhood Center, and Employment Center land use designations;

PSM LU-21.1.2 Areas where environmentally sensitive areas are not present;

PSM LU-21.1.3 In established neighborhood at 4 or more dwelling units per acre; and

PSM LU-21.1.4 Where sewer is available.

RESIDENTIAL RESOURCE

GOAL PSM LU-22 Carefully control residential development activities in the Urban Growth Area on sites that have been identified as open space in the Comprehensive Plan Open Space/Greenbelt Map through implementation of a Residential Resource zone.

PSM LU-22.1 Avoid fragmentation of the remaining open space corridors that create habitat for wildlife species native to the plan area and that benefit water quality.

PSM LU-22.1.1 Vegetation and tree preservation shall be a priority on each site that is developed in the Residential Resource zone.

PSM LU-22.1.2 To enhance corridors, open space should be located on each site plan so that it provides connectivity, is contiguous to open space on adjacent properties, connects stands of trees, and provides areas for wildlife movement.

PSM LU-22.1.3 Those portions of a site which contain high priority resource categories should be designated as the open space tract as these areas are most likely to promote healthy fish and wildlife habitat areas and enhance water quality.
PSM LU-22.1.4 Compatibility between the proposed use and designated open space tracts, as well as between adjacent uses, shall be maintained through a variety of techniques such as increased setbacks and vegetative screens utilizing native plant species.

PSM LU-22.2 Utilize environmentally sensitive design standards for development on sites that are located in a Residential Resource zone.

PSM LU-22.2.1 Impervious surfaces, in the form of rooftops, roads, and lawns which generate rapid runoff and prevent infiltration of water into the ground for gradual recharge of streams, shall be avoided or mitigated.

PSM LU-22.2.2 The greater the intensity of the development in terms of the noise, traffic, odor, light, and other factors that could impact the open space corridor, the more open space shall be required, up to 50% of the site.

PSM LU-22.2.3 Individual dwelling units and accessory dwelling units should be designed and placed in such a manner to avoid impacting the open space tract.

PSM LU-22.2.4 Lawns, turf areas, driveways, and roads should be limited and located in a manner that will result in the least impact to the open space tract.

PSM LU-22.2.5 Buildings, signage, and other structures such as fencing shall be located in a manner that ensures protection of the open space corridor.

PSM LU-22.2.5.1 Individual structures shall not be placed where the integrity of the open space tract and overall open space system could be compromised.

PSM LU-22.2.6 Other environmentally sensitive development tools should be considered for implementation including: reducing the amount of impervious surfaces on each site, minimizing soil disturbance and erosion, disconnecting constructed drainage courses, and utilizing micro-detention facilities on each lot where feasible rather than one facility at the end of a conveyance system.

PSM LU-22.3 Develop standards for implementation that describe a ratio between impervious surfaces and open space.

PSM LU-22.3.1 This ratio shall be based on the various environmentally sensitive development techniques and best management practices that are proposed on a site plan.

**High Density Residential**

**GOAL PSM LU-23** The primary uses within the High Density Residential District (HRD) designation shall be moderate to high density single-family detached, two-family, attached single-family and multifamily uses development.

**PSM LU-23.1** Commercial service and limited commercial retail establishments within the High Density Residential District designation shall be permitted only where the development is incorporated into a moderate to high density residential development complex.
PSM LU-23.2 Within the Moderate-High Density Residential (MHR) zone, retail shopping and convenience establishments shall be limited to 1,500 square feet, must be accessory to residential development, and must comply with residential design standards.

PSM LU-23.3 Office uses are permitted in portions of the HRD designation recognized as transitional areas between commercial centers, districts, and single-family neighborhoods, and must comply with residential design standards.

PSM LU-23.4 Compatible civic uses are permitted in the HRD designation and must comply with residential design standards.

GOAL PSM LU-24 Establish new residential zoning classifications that allow for variations in character within the High Density Residential District (HRD) land use designation.

PSM LU-24.1 Within the Moderate-High Density Residential (MHR) zone classification, provide for moderate to high density residential development and compatible civic uses.

PSM LU-24.1.1 The MHR can serve as a transition between commercial centers and districts and the MSF land use designation.

PSM LU-24.2 In Residential Office/Civic (ROC), provide for moderate to high density residential development; low to moderate intensity office, commercial service, and civic development; and limited commercial retail development in a pedestrian-oriented environment.

PSM LU-24.2.1 The ROC can serve as a transition between commercial centers and districts and the MSF land use designation.

GOAL PSM LU-25 Locate based on the following criteria:

PSM LU-25.1 Consider the following characteristics when applying the Moderate-High Density Residential (MHR) zone classification:

PSM LU-25.1.1 Vacant or redevelopable parcels within the Mixed Use District and Neighborhood Center land use designations;

PSM LU-25.1.2 Locations that provide direct access to public transportation services, commercial personal service and retail establishments, and other community amenities;

PSM LU-25.1.3 Areas where existing moderate to high density residential uses are already present;

PSM LU-25.1.4 Areas where environmentally sensitive areas are not present; and

PSM LU-25.1.5 Locations where moderate to high density residential uses can serve as a transition between commercial and employment areas and single-family neighborhoods.

PSM LU-25.2 Consider the following characteristics when applying the Residential Office/Civic (ROC) zone classification:
PSM LU-25.2.1 Vacant or redevelopable parcels within the Mixed Use District and Neighborhood Center land use designations;

PSM LU-25.2.2 Locations that provide direct access to public transportation services, commercial personal service and retail establishments, and other community amenities;

PSM LU-25.2.3 Areas where existing moderate to high density residential uses are already present;

PSM LU-25.2.4 Areas where environmentally sensitive areas are not present;

PSM LU-25.2.5 Locations where moderate to high density residential uses and pedestrian-oriented, low to moderate intensity office, commercial service, and limited retail commercial uses can serve as a transition between commercial and employment areas and single-family neighborhoods; and

PSM LU-25.2.6 The existing neighborhood is characterized by a mix of moderate to high density residential uses, and office, service commercial, or retail commercial development.

**HIGH DENSITY SINGLE-FAMILY**

The High Density Single-Family (HSF) zone classification is a new classification intended to provide for single-family detached residential uses with all entry on the first floor, at densities ranging from 6 to 12 dwelling units per acre.

**GOAL PSM LU-26** The High Density Single-Family (HSF) zoning classification shall allow a minimum density of 6 dwelling units per acre, and a maximum density of 12 dwelling units per acre.

**GOAL PSM LU-27** Locate based on the following criteria:

PSM LU-27.1 Consider the following characteristics when applying the High Density Single-Family (HSF) zone classification:

PSM LU-27.1.1 Located on an arterial, within 1,500 feet of a transit route;

PSM LU-27.1.2 Separated from other HSF areas, MHR areas, and MUD areas by 2,500 feet, or more;

PSM LU-27.1.3 Individual areas zoned HSF should be kept small in size to prevent the proliferation of large-scale apartment complexes; and

PSM LU-27.1.4 Sewer availability.

**IMPLEMENTING ACTIONS**

The following is a list of actions that are needed to implement the policies contained within this element of the plan. They are arranged according to the timeframe within which each should be completed: short, medium, or long term. Short term actions should occur immediately or within one year of plan adoption. Mid-term actions should be completed within 2-5 years.
Long term actions should be completed within 5-10 years of plan adoption. The party or parties responsible for leading the effort to complete the action item is listed in parenthesis following the action. Actions are assigned to the Parkland Area, Spanaway, and Midland Land Use Advisory Commissions (LUAC), Tacoma-Pierce County Health Department (TPCHD), Public Works & Utilities (PWU), Park & Recreation Services, Economic Development (ED), Pierce County Sheriff, or Pierce County Planning and Land Services (PALS).

**SHORT TERM ACTIONS**

1. The Pierce County Development Regulations-Zoning will be amended concurrently with the adoption of the PSM plan to:
   - Establish allowed uses in zone classifications.
   - Establish allowed residential densities throughout the plan area.
   - Establish structural setbacks, impervious surface restrictions, and height limitations.
   - Establish thresholds for the limitation or expansion of nonconforming uses.
   - Revise the Landscaping and Buffering Chapter, where needed, to maintain adequate buffers between commercial/industrial areas and residential areas and environmentally sensitive areas. These revisions should focus on preserving existing vegetation, when feasible. (PALS)
   - Establish regulations and maps to implement the High Density Single-Family zone classification.

2. Amend Title 18J, Development Regulations-Design Standards to adopt design standards and guidelines for commercial, industrial and residential areas within the plan area. At a minimum, the design standards should address:
   - Mitigation of any negative impacts between commercial/industrial areas and residential neighborhoods and sensitive features in the natural environment.
   - The transition between commercial/industrial uses and residential uses.
   - Minimizing any negative impacts between commercial/industrial areas and residential neighborhoods and sensitive features in the natural environment.
   - Providing acceptable visual and physical transition in bulk, setbacks, landscaping, and architectural style between the existing commercial/industrial uses and any adjoining residential uses.
   - Pedestrian access in and through residential developments.
   - Establishing requirements to set aside both passive and active open space areas.
   - Tree retention. (PALS)

3. Work with Pierce Transit to review bus service between and through residential neighborhoods, commercial centers and districts, and employment centers within the plan boundaries. (PALS, LUAC)

4. Work with WSDOT to develop strategies (projects) to achieve balanced flow of traffic volumes on Pacific Avenue. (PWU)
5. Revise development codes to recognize the historic uniqueness of certain centers, including but not limited to the Garfield Street Activity Center, through appropriate performance standards, design standards and guidelines, and other measures. (PALS, PWU, LUAC, ED)

6. Work with PLU to meld university functions into the broader Garfield Street Activity Center and broader neighborhood. (PALS, PLU, ED)

7. Work with PLU to implement those portions of its Master Plan that would increase vitality in the Garfield Street Activity Center and broader neighborhood. (PALS, PLU, ED)

8. Conduct an analysis that details the type, location, and density of new residential development during the first five-year review of the plan and every five years following. (PALS, LUAC)

### Mid-Term Actions

1. Amend the Pierce County Development Regulations-Environmental to adopt a regulatory framework to support planned actions within Pierce County. (PALS)

2. Develop planned action ordinances for pre-selected commercial/industrial areas within the communities plan boundaries. (PALS, ED)

3. Develop an inventory of locations within the communities plan area where commercial and industrial uses are now occurring and where redevelopment opportunities could occur in the future such as the potential to consolidate smaller parcels of commercial/industrial land to facilitate their use in a more efficient manner. (PALS, LUAC)

4. Track annual development of commercial and industrial uses within the communities plan area to determine if the actual level of development provides an adequate amount of land for economic growth within the communities plan area. (ED)

5. Prepare a report related to annual economic indicators every 5 years or in conjunction with a communities plan update, whichever comes first. (ED)

### Long Term Actions

1. Work with the local business community to:
   
   - Target commercial areas for revitalization efforts.
   - Help develop common promotion (advertising, joint merchandising, and special events) and business development (leasing, business recruitment, and market research) within selected commercial target areas.
   - Provide Small Business Administration (SBA) information to local businesses regarding the availability of funding for improvements, expansions, relocations, etc.
   - Educate employers on rideshare and public transportation subsidies for employees who utilize public transportation
   - Develop the framework for a business improvement program including but not limited to structuring local marketing efforts, physical improvements programs,
parking and building improvements, special management organizations, or other programs necessary for effective revitalization of the area.

2. Work with the Tacoma-Pierce County Chamber of Commerce to provide services within the plan area such as business promotion (common advertising, joint merchandising, and special events), business development (leasing information, business recruitment, market research), and labor recruitment and training. (LUAC)

3. Conduct a study to determine the amount of land needed to provide an adequate amount of commercial and industrial uses to meet the employment needs of the current population and projected population growth. (LUAC)

4. Maintain current commercial and industrial site survey information such as available and projected public services, surrounding land uses, transportation capabilities, critical areas, and other relevant economic information. (ED)

5. Provide education to the local citizenry on job training services and employment opportunities which are available within the communities plan area.

6. Promote job search and skills training opportunities provided by local community and technical colleges. (ED)

7. Actively recruit the following commercial and industrial uses to locate within the communities plan area:

   - Recreational/youth-oriented commercial activities such as movie theaters, bowling alleys, etc. in the commercial centers;
   - Health care industry facilities in commercial centers;
   - Lodging opportunities in the Activity and Community Centers, particularly in the vicinity of the Pacific Lutheran University campus;
   - Office space for professional services, computer industries, or corporate headquarters in commercial centers and selected portions of the Community Employment Centers;
   - Pedestrian-oriented retail uses such as arts and crafts, specialized gift shops, delis, restaurants, boutiques, etc. in commercial centers;
   - Destination attractions and supporting uses, including but not limited to the Harold LeMay Car Collection or portion thereof, which could draw Mount Rainier bound tourists and cause them to linger in the communities;
   - Businesses which could benefit from proximity to the staff and students of Pacific Lutheran University;
   - Commercial businesses needed by military personnel or businesses that can be supportive of military operations. (ED)

8. Work with the Washington State Department of Employment Securities to develop a Employment Securities Department co-location site within the communities plan area.

9. Work with the community to develop programs and ordinances to preserve and protect the historic character existing in certain commercial centers. (PALS LUAC)
Map I-1: Land Use Designations

*Note: The legend shows only the land use designations within the Parkland-Spanaway-Midland Communities Plan Area. The areas outside this plan area are masked within the map display.
Chapter 3: Community Character and Design Element

Introduction

Community design deals with the physical elements that compose the character of our communities: the streets, parks, buildings, open space, and neighborhoods that determine the way our communities look and feel. It is a blending of land use planning, architecture, landscape architecture, and environmental protection. Community design looks at the way in which buildings, streets, public places, natural features, and other development relate to one another and the people who use them. Through community design, individual improvements, such as street construction, park development, land use regulation and new commercial, industrial, residential, and civic development can be effectively coordinated with each other to promote a unified community image.

The way in which people experience their communities and interact with one another is determined, in large measure, by a community’s design. Designs that emphasize community are those that invite human presence and allow for interaction of people. Where design is not a consideration, community land use planning and regulation often fail to recognize the functional and visual links between developments. Poorly designed development tends to hinder the development of desired land uses.

The Community Character and Design Element is an integral part of the entire growth management planning process for Parkland, Spanaway, and Midland. Design directly affects land use patterns, transportation planning, community and neighborhood livability, and overall quality of life. The design direction found in the communities plan is intended to reinforce the aesthetic character that the communities want to retain and build upon and to create a new threshold for site and building design in areas of the communities where the existing character of uses reflects poorly on the image the overall community would like to portray to its own residents and visitors to their communities.

Description of Current Conditions

Historically, the commercial portions of the plan area have developed absent a consistent design theme or set of design standards. As a result, many of the buildings have standardized franchise themes or, in the case of independent businesses, no theme at all. Without question, the area has developed with incompatible architectural styles that lack consistent character.

With the exception of older, established neighborhoods, the existing residential character is void of significant vegetative buffers within and surrounding developments. Significant stands of trees have not been retained and complete removal of understory vegetation has been a common development practice. Until 1998, there were no design standards required for residential development within the plan area. The residential complexion of the area is largely
single-family and duplex with high concentrations of multifamily in the Parkland area along the major arterials.

**DESCRIPTION OF DESIRED CONDITIONS**

The citizens of Parkland, Spanaway, and Midland want to make their communities desirable places to live. They would like to restore the unique character of many neighborhoods, preserve historic resources throughout the area, and blend natural features with the built environment. The Parkland-Spanaway-Midland Communities Plan accomplishes these goals through the use of design standards and other regulatory measures.

**GATEWAYS**

Two state highways traverse the Parkland-Spanaway-Midland community, providing opportunities to create attractive entrances to the area. Plantings, signs, public art, and other features will be used to create aesthetically pleasing gateways and provide a sense of the community. Once inside Parkland-Spanaway-Midland, gateways into individual neighborhoods will be designed to emphasize their character and unique sense of place.

**NEIGHBORHOODS**

Travel routes will emphasize scenic views and be accented by streetscapes that reflect the sense of community. Residential areas will have a diversity of housing types reflecting community identity, a small town atmosphere, and respect for the natural environment. Neighborhoods will be characterized by houses that accentuate the living area of houses and de-emphasize carports and garages. Roadways will be separated from pedestrian and bicycle pathways so as to encourage a variety of modes of transportation. Streetscapes will be highlighted by trees and other plantings. Vehicular access points will be minimized. Residential areas will feature a variety of architectural features that minimize the scale of larger buildings so as to blend with the desired scale for the neighborhood. Natural features, such as wetlands, streams, and significant stands of trees, will be integrated into the site design for residential developments, thereby resulting in developed areas that complement the surrounding landscape.

**DESIGN**

A key to design in the Parkland-Spanaway-Midland area will be to blend the natural and built environment to create neighborhoods and business areas that are functional, visually attractive, and compatible with the natural surroundings. This will occur in a number of ways:

- Uses within an area will blend through compatible design.
- Problems associated with potentially conflicting adjacent uses will be mitigated with a variety of site design and landscaping techniques.
• Attention will be given to assure a smooth transition between residential, commercial, industrial, and civic uses.
• Natural features and critical areas will be preserved and incorporated into site design.
• The apparent scale of large commercial and industrial buildings will be reduced through the design and placement of structures and through the effective use of landscaping.
• Pedestrian walkways will be separated from automobile circulation and located to provide ease of access between businesses and throughout neighborhoods.
• Amenities such as courtyards, benches, art work, and lighting will be integrated into site design to attract pedestrian use.
• Parking areas will be situated and designed to minimize visibility from streets and the front of buildings.
• Building and site design will emphasize safety through effective use of lighting, site design, and landscaping.
• The appearance of streetscapes will be enhanced using attractive signs which provide information while blending with the surrounding area.
• Impacts to the natural environment will be mitigated through the application of site inventory and analysis requirements and environmentally sensitive design standards.

HISTORIC RESOURCES

The residents of Parkland-Spanaway-Midland recognize the importance of preserving historic resources. To ensure that the historic character and features of the area are maintained, redevelopment and renovation of historic structures will occur so as to preserve the integrity of those structures. Productive and attractive uses of historic buildings will be encouraged while new developments will be consistent with historic sites and structures.

CULTURAL RESOURCES POLICIES

GOAL PSM CR-1 In the alteration of existing buildings and construction of new buildings, the following principles should be followed:

PSM CR-1.1 Adhere to historic front property setbacks;
PSM CR-1.2 Install awnings and canopies that are compatible to the historic character of the district; and
PSM CR-1.3 Use exterior materials and designs that are compatible with nearby historic structures.

GOAL PSM CR-2 Explore opportunities for forming a historic district program.

GOAL PSM CR-3 Encourage property owners and developers to conduct a structural engineering assessment of buildings to determine the structural deficiencies before rehabilitation activities begin on designated historic properties.
PSM CR-3.1  Pierce County and private sector interests shall investigate the feasibility of establishing a financial revolving loan program dedicated to structural engineering analyses and implementation of recommended structural repairs.

GOAL PSM CR-4  Encourage productive and economically attractive uses of historic buildings.

PSM CR-4.1  Encourage private investment to renovate commercial buildings.

PSM CR-4.2  Through public and private efforts, obtain recognition, financial assistance, and technical assistance for historic properties currently on historic registers and those which have been identified as having potential historic significance to the communities.

GOAL PSM CR-5  Conserve and interpret the heritage of the Parkland, Spanaway, and Midland communities so that their citizens can be aware of connections with the past.

PSM CR-5.1  Promote use of features that reflect characteristics of Parkland, Spanaway, or Midland’s history in the architectural and site designs of commercial, industrial, civic, and residential developments.

PSM CR-5.2  Pierce County should establish a task force to look at historic signage.

DESIGN AND CHARACTER POLICIES

GOALS

Ensure a high quality visual environment through design, guidelines, standards, and procedures for architectural, site, and landscape design in all public and private development.

The intent of the policies contained within the Community Character and Design Element is to provide design concepts and policies which will direct future development in a way that creates, reinforces, or preserves the character and sense of place within Parkland, Spanaway, and Midland.

GATEWAYS

GOAL PSM D-1  Create identifiable boundaries, entries, and gateways for Parkland-Spanaway-Midland so that residents, workers, and visitors know they are entering the community.

PSM D-1.1  Pierce County shall work with the Washington State Department of Transportation (WSDOT) to develop planting plans distinctive to Parkland, Spanaway, and Midland for SR 7 and SR 512.

PSM D-1.2  Pierce County shall develop planting plans distinctive to Parkland, Spanaway, and Midland along major County routes entering the communities and neighborhoods within the communities.
Recognized entries consisting of tree plantings, signage, or public art shall be established at the following locations to create a gateway effect into the communities and neighborhoods within the communities.

Midland:

N: Portland Avenue E. at 72nd Street E.;
N: Golden Given Road E. at 72nd Street E.;
E: 80th Street E. at 22nd Avenue Court E.;
E: 85th Street E. at the 2200 block;
E: 104th Street E. at 22nd Avenue E.;
W: 80th Street E. at McKinley Avenue E.;
W: 85th Street E. at McKinley Avenue E.;
W: 96th Street E. at McKinley Avenue E.;
W: 99th Street E. at Pacific Avenue;
S: Golden Given Road E. at the north edge of SR 512; and
S: Portland Avenue E. at the north edge of SR 512.

Parkland:

N: Pacific Avenue at 99th Street S.;
N: Yakima Avenue S. at 96th Street S.;
N: Ainsworth Avenue S. at 96th Street S.;
N: Steele Street S. at 96th Street S.;
N: Waller Road E. at Brookdale Road E.;
N: Golden Given Road E. at Brookdale Road E.;
E: 99th Street S. at Pacific Avenue;
E: 108th Street S. at A Street (the west-bound Pacific Avenue off-ramp of SR 512);
E: 112th Street E. at Golden Given Road E.;
E: 128th Street E. at Golden Given Road E.;
E: Brookdale Road E. at Golden Given Road E.;
W: 96th Street S. at the east edge of Interstate 5;
W: 102nd Street S. at Sales Road S.;
W: Sales Road/108th Street S. at Steele Street S.;
W: 112th Street S. at Steele Street S.;
W: Steele Street S. at 23rd Avenue S.;
S: Spanaway Loop Road S. at Military Rd.; and
S: Pacific Avenue at 152nd/Military Road.

Spanaway:

N: Spanaway Loop Road S. at 152nd/Military Road;
N: Pacific Avenue at 152nd/Military Road;
N: Waller Road (south side) at Brookdale Road E.;
E: 152nd Street E. at 27th Avenue E.;
E: 160th Street E. at the 2600 block;
E: 176th Street E. at the 2600 block;
GOAL PSM D-2 Streetscape improvement plans shall address the following topics: public and private landscaping, sidewalk and crosswalk improvements, street furniture, signage, utility placement, funding sources, development priorities, etc.

GOAL PSM D-3 Create a clearly defined entry into the Garfield Street Activity Center, Garfield Street, and Pacific Lutheran University (PLU) from Pacific Avenue, Park Avenue, and C Street through signage, landscaping, paving, and street furniture.

PSM D-3.1 Pierce County shall work with PLU to meld university functions into the broader Garfield Street Activity Center and broader neighborhood.

PSM D-3.2 Pierce County shall work with PLU, the business community, the surrounding Parkland community, Pierce Transit, and the WSDOT to develop a streetscape improvement plan for the Garfield Street Activity Center.

GOAL PSM D-4 Through signage, landscaping, paving, and street furniture, create a clearly defined entry into the 176th Street Community Center from Pacific Avenue, Spanaway Loop Road/176th Street, and potentially the Cross Base Highway.

PSM D-4.1 Pierce County shall work with the business community, the surrounding Spanaway community, Pierce Transit, and the WSDOT to develop a streetscape improvement plan for the 176th Street Community Center.

GOAL PSM D-5 Pierce County shall work with the developers of the approved Hidden Village Shopping Center to develop a project that is pedestrian-oriented in design and includes uses that encourage customers to stroll from business to business.

PSM D-5.1 Create a clearly defined entry into the 8th Avenue Community Center from 8th Avenue and Mountain Highway through signage, landscaping, paving, and street furniture.

PSM D-5.2 Pierce County shall work with the developers of the Hidden Village shopping center, the general business community, the surrounding Spanaway community, Pierce Transit, and the WSDOT to develop a streetscape improvement plan for the 8th Avenue Community Center.

PSM D-5.3 The streetscape plan developed for the 8th Avenue Community Center shall be coordinated with the streetscape plan for the Mixed Use District located across Mountain Highway to the west.

PSM D-5.4 Pierce County Planning and Land Services shall work with the corridor business communities, the surrounding residential communities, Pierce County Public Works and Utilities, Pierce Transit, and the WSDOT to develop a streetscape improvement plan for the MUDs.
GOAL PSM D-6  Pierce County shall work with the general business community, the surrounding Midland community, and Pierce Transit to develop a streetscape improvement plan for the 99th Street, 112th Street, and Park Avenue/162nd Street Neighborhood Centers.

GOAL PSM D-7  Provide landscaping and building placement requirements to improve the appearance along the SR 512 freeway.

PSM D-7.1  Loading docks, outdoor storage, parking lots, and waste facilities shall be sited and screened so that they are not prominent when viewed from the freeway.

PSM D-7.2  Building facades facing and visible from the freeway should have the same high quality design as the non-freeway facing facades.

PSM D-7.3  Signage associated with properties fronting the freeway shall be sized and designed to provide minimal visual impacts on freeway users.

PSM D-7.4  The freeway corridor through Midland and Parkland shall be buffered through the establishment and retention of substantial plantings to achieve year-round screening.

PSM D-7.4.1  Freeway landscape plans shall be implemented through landscape plans for new development or redevelopment of properties abutting or visible from the freeway.

PSM D-7.4.2  Pierce County and the communities shall enhance landscaping within the freeway rights-of-way through cooperative planting efforts with the Washington State Department of Transportation.

GOAL PSM D-8  Pierce County shall designate scenic driving, walking, or biking routes along major streets.

GOAL PSM D-9  Promote the planting of street trees to enhance neighborhood character.

PSM D-9.1  Pierce County, in conjunction with business organizations, community groups, and property owners, shall develop street tree management programs.

PSM D-9.2  Such programs shall focus on maintenance and enforcement.

NEIGHBORHOODS

GOAL PSM D-10  Encourage design that reflects the wide diversity among residents, provided each maintains a degree of compatibility and reflects the character of the plan area.

PSM D-10.1  Encourage development to recognize and incorporate significant distant views into project design.

PSM D-10.2  Utilize interior circulation systems in new developments thus minimizing access points along streets.

PSM D-10.2.1  Curb cuts should be utilized only where traffic needs and safety considerations allow.
GOAL PSM D-11 Require urban development standards in all new urban developments.

PSM D-11.1 Sidewalks, public transit amenities, street trees, and street lighting shall be provided within developments and abutting frontage roads.

PSM D-11.2 Minimize site excavation.

PSM D-11.3 Natural vegetative cover should be planted on slopes of all cuts and fills in conformance with safety, erosion, and visual aesthetics standards.

PSM D-11.4 Provide for separate automobile, pedestrian, and bicycle access.

PSM D-11.5 Create a transition between residential, commercial, industrial, and civic uses through a variety of measures including setbacks, screening, berming, vegetative buffering, and shielded lighting.

GOAL PSM D-12 Develop specific design guidelines for single-family and multifamily residential development dealing with site planning and building placement.

PSM D-12.1 Promote the visual quality of neighborhood streetscapes so that they become a valued element of the character of the community and enhance neighborhood quality.

PSM D-12.2 Provide opportunity for porches and decks within front yard setbacks.

PSM D-12.2.1 Permit single-family detached dwelling units to encroach into front yard setbacks the same distance the garage entrance is recessed behind the front yard setback line.

PSM D-12.3 Encourage underground stormwater retention systems by providing development incentives.

PSM D-12.4 Discourage flag lots or pipestem lots within new residential developments.

GOAL PSM D-13 Develop specific design guidelines for two-family (duplex), attached single-family, and multifamily residential developments dealing with architectural design and scale of buildings.

PSM D-13.1 Provide incentives for innovative architectural design of two-family (duplex), attached single-family, and multifamily residential development.

PSM D-13.2 Discourage residential design that accentuates carports and garages.

PSM D-13.2.1 Encourage two-family developments that provide alley access to the vehicle enclosure.

PSM D-13.3 Avoid locating parking areas for multifamily developments between the buildings and the street.

COMMERCIAL AND INDUSTRIAL

GOAL PSM D-14 Organize the site plan to provide an orderly and easily understood arrangement of building, landscaping, and circulation elements that support the functions of the site.
PSM D-14.1 Emphasize the importance of street corners through building location, pedestrian access, special site features, or landscape features.

PSM D-14.2 Provide adequate lighting levels in all pedestrian areas including building entries, along walkways, parking areas, and other public areas.

PSM D-14.3 Design landscaping so that long term growth will not interfere with site lighting and surveillance.

PSM D-14.4 Use durable, high quality materials in site furnishings and features for ease of maintenance.

PSM D-14.5 Use fencing and landscaping with high quality materials to conceal outside storage and sales areas.

PSM D-14.6 Where distant view corridors have been identified, require development to recognize and incorporate these into project design.

PSM D-14.7 Integrate water quality treatment techniques such as biofiltration swales and ponds with overall site design, where appropriate.

PSM D-14.8 Encourage pedestrian movement between commercial properties and neighborhoods by providing gates, ramps, and steps where natural or man-made barriers exist.

PSM D-14.9 Dedicate additional rights-of-way to enable the construction of sidewalk improvements where adjacent rights-of-way are substandard in width.

PSM D-14.10 Integrate bicycle use, access, and parking into site designs.

GOAL PSM D-15 Architectural and site design of non-residential developments should reflect desired neighborhood or community character.

PSM D-15.1 Provide for visual and functional continuity between the proposed development and adjacent structures when these existing structures demonstrate minimal consistency with the building design criteria of this plan.

PSM D-15.2 Incorporate architectural design features reflective of residential building scale and character into non-residential buildings in portions of centers and corridors where they abut or are in proximity to single- and two-family neighborhoods.

PSM D-15.3 Provide distinctive building corners at street intersections through the use of special architectural elements and detailing and pedestrian-oriented features where possible.

PSM D-15.4 Integrate the design and placement of exterior lighting with the architectural design and materials of on-site buildings, overall site character, and the surrounding neighborhood.

PSM D-15.5 Street-facing building facades shall employ a variety of measures including window and entrance treatments, overhangs and projections, and innovative use of standard building materials and landscaping to increase visual interest and visually break up large building massings.
PSM D-15.6  Provide pedestrian-friendly facades on the ground floor of all buildings that face public streets and parking areas.

PSM D-15.7  Provide visual relief for large blank walls such as murals, landscaping, or variations in building relief that are visible from pedestrian walkways and parking areas.

PSM D-15.8  Enhance building entries with a combination of weather protection, landscaping, pedestrian amenities, or distinctive architectural features.

PSM D-15.9  Locate or screen roof-mounted mechanical equipment to minimize visibility from public streets, building approaches, and adjacent properties.

PSM D-15.10 Locate or screen utility meters, electrical conduit, and other utility equipment to minimize visibility from the street.

GOAL PSM D-16  Select plant materials that are appropriate to their location in terms of hardiness, maintenance needs, and growth characteristics with an emphasis on use of native and drought-resistant vegetation.

PSM D-16.1  Incorporate existing significant trees, wooded areas, or native vegetation into the planting design where they would contribute positively to the overall landscape and site design, enhance habitats for various species of fish, bird, and animal species, and the neighborhood as a whole.

PSM D-16.2  Utilize adopted street tree plans when developing on-site landscape designs.

GOAL PSM D-17  Encourage and provide incentives for including open space and retaining existing native vegetation on sites proposed for urban development.

PSM D-17.1  Prohibit the vacation of unopened public rights-of-way at shoreline locations except when the vacation would enable a public authority to acquire the vacated property for public purposes.

PSM D-17.2  Provide a procedure for removing dangerous or diseased trees that require mitigation, including replacement of any removed trees.

PSM D-17.2.1  Sites that are devoid or deficient in vegetation shall be required to introduce supplemental landscaping with plantings that are native to the Pacific Northwest and are based on the historic indigenous plant species for the underlying soils.

PSM D-17.2.2  These supplemental plantings shall equal the minimum amount required for retention.

PSM D-17.3  Reduce the amount of density or intensity allowed within a proposed development for lack of permanently designated usable open space.
GOAL PSM D-18
Property improved with buildings, parking areas, and other impervious cover shall include areas of natural and landscaped vegetative cover to protect the aesthetic qualities of the area, to protect aquifers and aquifer recharge areas, provide urban wildlife habitat, and to prevent runoff to adjoining properties, streams, and other critical areas.

PSM D-18.1
Require natural or planted vegetative screens as an integral part of areas with expansive impervious cover.

PSM D-18.2
Provide a range of open space dedication requirements, from 15% to 50% of the site, based upon the density or intensity of the proposed use.

PSM D-18.3
Require a permanent dedication of open space as a condition of approval for a site plan or division of land.

PSM D-18.3.1 The following uses should be allowed within designated open space areas and are listed in order of priority:

PSM D-18.3.1.1 Preservation of natural vegetation including fish and wildlife habitat;
PSM D-18.3.1.2 Natural resource protection including steep slopes and aquifer recharge areas;
PSM D-18.3.1.3 Buffers between incompatible land uses;
PSM D-18.3.1.4 Passive recreation (pervious and impervious trails);
PSM D-18.3.1.5 Active recreation (golf course);
PSM D-18.3.1.6 On-site utilities (drainfields, stormwater retention facilities); and
PSM D-18.3.1.7 Pedestrian and bicycle trails.

PSM D-18.4
Require the open space area to be clearly marked and identified as a protected area through the use of methods such as fencing (when appropriate) and signage.

GOAL PSM D-19
Protect adjacent sites and uses or mixes of commercial, industrial, or residential uses on the same site from the noxious effects (e.g., noise, light, odor, particulate, or other air pollution, traffic) generated by other uses through the use of vegetation.

PSM D-19.1
Require vegetative screens between new urban development and adjacent uses.

PSM D-19.2
Provide a range of required vegetation screening widths based upon the use, density, and intensity of the proposal.

PSM D-19.2.1 Vegetation screening requirements should range from 20 to 70 feet based on the increase in impacts or the degree of incompatibility between uses.

PSM D-19.2.2 Screening performance is judged as it will exist at the time the development is completed and not as it will exist at some time in the future.

PSM D-19.3
Encourage the provision of public easements where linkages between open space and screening buffers occur.

PSM D-19.4
Preserve established vegetation buffers in perpetuity.
PSM D-19.5
Encourage the replanting of greenbelts on previously developed commercial and residential sites through public assistance, grants, and incentives.

PSM D-19.5.1 Cooperative programs should be established with owners and residents of such developments to assure that such properties achieve suitable screening within a five-year time period.

GOAL PSM D-20
Improve neighborhood health, safety, and appearance by requiring homeowners to be responsible for the proper storage of waste and vehicles, maintenance of yards, and the screening of hobby vehicle repair or restoration to ensure these activities do not adversely affect neighbors.

PSM D-20.1 Limit outdoor vehicle storage as an accessory use on residential property to 5 vehicles.

PSM D-20.2 Provide criteria and a permitting process to allow for residential storage of more than 5 vehicles under limited conditions.

PSM D-20.3 Require screening for proper storage of vehicles to protect the environment and for sight-obscuring screening of vehicles undergoing repair or restoration.

PSM D-20.4 Develop an abatement or amnesty program for the removal of junk vehicles from residential properties.

PSM D-20.5 Establish and publicize standards for the storage and proper handling of household garbage and other solid waste on residential property.

SIGNS

GOAL PSM D-21 Consistently apply and enforce sign regulations.

PSM D-21.1 Require consolidation of signage within commercial development to reduce visual clutter along streets and the freeway.

PSM D-21.2 Integrate freestanding signs with the placement and design of landscape features.

PSM D-21.3 Prohibit any additional billboard faces or structures in the three communities beyond those existing at initial communities plan adoption, and provide for the elimination of nonconforming billboard signs after a reasonable amortization period.

IMPLEMENTING ACTIONS

The following is a list of actions that need to be completed in order to implement the policies contained within this plan. They are arranged according to the timeframe within which each should be completed: short, medium, or long term. Short term actions should occur immediately or within one year of plan adoption. Mid-term actions should be completed within 2-5 years. Long term actions should be completed within 5-10 years of plan adoption. The party or parties responsible for leading the effort to complete the action item is listed in parenthesis following the action. Actions are assigned to the Parkland Area, Spanaway, and
Midland Land Use Advisory Commissions (LUAC), Tacoma-Pierce County Health Department (TPCHD), Public Works & Utilities (PWU), Park & Recreation Services, Economic Development (ED), Pierce County Sheriff, or Pierce County Planning and Land Services (PALS).

**SHORT TERM ACTIONS**

1. **Amend Title 18A-Zoning (PALS, LUAC)**
   - Develop and adopt an incentive program for open space preservation in the UGA that allows innovative measures such as clustering development, zero-lot-line setbacks, and other techniques.
   - Amend the landscaping standards to require vegetative screens between new urban development and adjacent uses and street tree plans.
   - Require urban development standards such as curbs, gutters, and sidewalks for development in the UGA.
   - Establish a Residential Resource zone on residential areas that have been identified as open space in the Comprehensive Plan Open Space/Greenbelt Map.
   - Amend impervious coverage requirements.
   - Establish minimum vegetation retention requirements.
   - Amend standards addressing storage of vehicles as an accessory use.
   - Amend Title 18J-Design Standards and Guidelines (PALS, LUAC)
   - Establish urban design standards and guidelines in the plan area for:
     - Two-family, attached single-family, and multifamily residential development dealing with site planning, building placement, and architectural design and scale of buildings.
     - Commercial, civic, and industrial uses regarding building placement, landscape and buffering, sign placement, height, massing, materials, storefronts, and canopy and awning styles.
   - Establish design standards and guidelines for the Residential Resource zone.
   - Establish design standards and guidelines for natural resource protection, vegetation and tree retention, vegetative screening, and open space corridors.
   - Establish design standards for passive open space areas and on-site recreation.
   - Establish a basic set of concise design principles for all land uses subject to design review.
   - Develop flexible design guidelines that can be utilized for use permits that are subject to administrative review or public hearings.
   - Administer a site plan review process with the appropriate land use advisory commission to utilize design guidelines and to review deviations from design standards.
   - Establish design standards and guidelines for open space corridors that require the use of environmentally sensitive development techniques, such as limiting impervious surfaces and preserving wildlife corridors and native vegetation.
2. Amend Title 18, General Provisions (PALS, LUAC)
   • Develop and adopt provisions for stringent enforcement of screening and buffering standards.

**Mid-Term Actions**

1. Amend the Pierce County Sign Code (PALS)
   • Develop and adopt standards that reduce the number and size of nonconforming signs.
   • Restrict off-site advertising signs and billboards in the plan area.
   • Promote signs that increase public awareness of environmentally sensitive areas.

**Long Term Actions**

1. Implement a monitoring program to evaluate the impacts of community design standards. (PALS)
2. Develop and adopt a tree conservation regulation to be considered for application county-wide in the next substantive amendment to those regulations. (PALS)
   • Work with the WSU Cooperative Extension Master Gardener to develop training programs for Land Use Advisory Commissions on acceptable types of native plantings.
Historic Resources

- Pierce County Historic Resource Inventory
- Pierce County Register of Historic Places
- State of Washington Historical Register
- National Historic Register

Note: All properties included in any of the three Historic Registers are also included in the Pierce County Historic Resource Inventory.
Chapter 4: Natural Environment Element

INTRODUCTION

As in other parts of the Puget Sound region, during the last 50 years, the Parkland-Spanaway-Midland communities have experienced a high level of urban growth. With that growth has also come a slow degradation of the natural environment and the fish and wildlife species that are supported by the native vegetation which constitutes habitat areas. Generally, there has been a decrease in the water quality of the rivers, streams, lakes, and wetlands, the amount of native vegetation, and populations and diversity in fish and wildlife species. However, several pockets of good quality habitat areas remain, many of which have been recently targeted for acquisition and restoration efforts.

DESCRIPTION OF CURRENT CONDITIONS

AIR RESOURCES

The Puget Sound region is currently classified as an “attainment area” for carbon monoxide, sulfur dioxide, nitrogen dioxide, lead, and ozone and is working on gaining attainment status for particulate matter. Air quality within the Parkland-Spanaway-Midland area is generally consistent with greater Puget Sound, however, localized air quality problems tend to occur around the eastern boundary of McChord Air Force Base (AFB) as a result of military jet fueling activities and associated exhaust emissions.

The most common air pollutants within the Puget Sound airshed are referred to as the “dirty six” and include: particulate matter (PM10/PM2.5), carbon monoxide (CO), ozone (O3), sulfur dioxide (SO2), and lead. In addition to the dirty six, there are other toxic air pollutants in our air such as arsenic, asbestos, benzene, vinyl chloride, mercury, and beryllium; however, levels of these pollutants within the Puget Sound region are not currently being monitored and reported.

The Puget Sound Clean Air Agency (PSCAA), in cooperation with the Washington State Department of Ecology (DOE), monitors air quality in a four-county region (Snohomish, King, Pierce, and Kitsap) for compliance with federally established standards. The primary purpose of this monitoring is to ensure the health and welfare of the human, animal, and plant life within the Puget Sound region. Three terms describe an area’s air quality status compared to the federal standards for the primary six pollutants—attainment, exceedance, and violation. Attainment means that the federal standards have been met for a number of consecutive years and that they can be expected to be met in the future. Exceedance occurs when a monitoring station records a higher level than allowed by federal standards during a given timeframe for a specific pollutant. A violation of a federal standard occurs when an individual monitoring site measures more exceedances than allowed during a specific timeframe (e.g., in the case of ozone, the standards allow three exceedances within a three year period).
EARTH RESOURCES

SOILS

The soils found within the plan area range from well draining to poorly draining. Pierce County Surface Water Management classifies soils into hydrologic soil groups A through D which range from low runoff potential with high infiltration capacity (group A) to high runoff potential with low infiltration capacity (group D). These soil types become indicators of which areas are more susceptible to surface water runoff, flooding, and groundwater recharge problems. The former can result in insufficient filtration of runoff pollutants, which results in inadequate protection of groundwater quality. Also, because water moves so freely through these well draining soils, high annual rainfall can result in a higher groundwater table which floods low spots in the topography as the groundwater moves from the outer reaches in the southeast corner of the watershed to the northwest towards Puget Sound. The latter soil type can result in potential for septic failure and quick surface runoff that creates flooding even during smaller storm events.

Parkland and Spanaway are underlain by Spanaway gravelly sand loam. This soil type was formed in glacial outwash and mixed in the upper layer with volcanic ash. The soil is somewhat excessively drained—permeability is moderately rapid and there is minor erosion hazard. This soil type tends to become dry and droughty during the summer and early fall. The primary historic land cover types are prairies and savannahs, though this soil can also support woodlands.

The majority of Midland is comprised of Kapowsin gravelly loam, which begins at the upland bench and runs at a northwesterly angle from Brookdale Road to Yakima Avenue at the northern boundary of the plan area. These soils were formed in glacial till under conifers. The land is nearly level and is moderately well drained with pockets of very poorly drained soils. The water table is perched above the very slowly permeable substratum during the rainy season, which results in surface water runoff problems. Much of this area is in second and third growth conifer woodlands.

Scattered throughout the plan area are Dupont muck, Everett gravelly loam, and tisch silt soils which support wetland vegetation. In addition, the Clover Creek trough is comprised of Spanaway loam type soils, which run the length of the riparian system through the plan area.

LANDSLIDE AND EROSION HAZARD AREAS

The plan area contains few landslide and erosion hazard areas with the one exception being the upland bench. This area occurs over an approximately 200-foot rise and is classified as having between a 15% to a 30% slope. The upland bench area serves as a transition zone between the prairie type vegetation, which occurs in the communities of Parkland and Spanaway, and the conifer woodland vegetation zone found in Midland.
**Vegetation**

The historic plant communities were prairies, savannahs, and conifer woodlands. The prairies (grasslands) and savannahs (grasslands with sporadic tree cover) are supported by the Spanaway gravelly sand loam soil located in the Parkland and Spanaway communities. The tendency for these soils to become dry and droughty during the summer and early fall creates conditions favorable for native vegetation and trees such as Garry (Oregon white) oak trees, bunchgrass, Idaho fescue, western buttercups, shooting stars, violets, camas, balsam root, prairie lupines, and woolly sunflowers. Historically, local Native Americans induced periodic fires that prevented the prairies and savannahs from developing into a dense forest cover. Conifer woodlands and wetland plant communities are supported by Kapowsin gravelly loam soils located in Midland.

Over the last several decades, the combination of agriculture, urban development, and fire suppression in the South Puget Sound region has resulted in a dramatic decrease in the prairie and savannah areas. It has been estimated that within the region over 97% of the prairies have been destroyed and oak savannahs have been virtually extirpated. Several prairie plant species are now rare or threatened with extinction including golden Indian paintbrush (*Castilleja levisecta*), white-topped aster (*Aster curtus*), and small-flowered trillium (*Trillium parviflorum*). Torrey’s peavine (*Lathyrus torreyi*) was thought to be extinct in Washington until it was rediscovered in 1994 on the western edge of the PSM area on McChord AFB. Several other plant species are historically known to inhabit prairies, but have not been identified in the field for years including tall agoseris (*Agoseris elata*), rose checkermallow (*Sidalcea malviflora ssp. virgata*), and common blue-cup (*Githopsis speculariodes*).

The Washington Department of Natural Resources (WDNR), in conjunction with the U.S. Fish and Wildlife Service and Tahoma Audubon, recently completed a Pierce County survey of oak woodland stands greater than one acre in size. All of the identified stands of oak within the plan area are located in the communities of Parkland and Spanaway. In addition, the plan area contains several large stands of mixed woodlands (hardwoods and conifers ranging from early to late seral) as depicted by the WDNR, 1991 Landsat Thematic Mapped Images. (See Map I-5: Oak Presence)

Other significant tree species within the plan area are the Pacific yew (*Taxus brevifolia*), Pacific madrone (*Arbutus menziesii*), and the Ponderosa pine (*Pinus ponderosa*).

Currently, Pierce County regulations that restrict the removal of vegetation are found in Title 18E Development Regulation-Critical Areas under the wetlands, geologically hazardous areas, and fish and wildlife habitat chapters. The fish and wildlife habitat chapter also identifies oak woodlands and prairies as habitats of local importance; however, currently there is no adopted mapping available to identify these special habitats and therefore, in some cases, application of the regulations to these areas may be missed.

**Water Resources**

Parkland-Spanaway-Midland straddle two Water Resource Inventory Areas (WRIAs), Puyallup-White WRIA in the northeast portion of Midland, and the Clover-Chambers Creek WRIA (also
referred to as the Tacoma WRIA) in the remaining plan area. Three watershed basins are located within the Clover-Chambers Creek WRIA including Chambers Bay, Clover Creek/Steilacoom, and American Lake, while the Puyallup-White WRIA is divided by the Commencement Bay and Clear/Clarks Creek basins. It is important to note that a portion of the Midland area drains into the Clear/Clarks Creek basin in the Puyallup-White WRIA. Some residents of the Midland area have expressed concern about the health of Swan Creek, which lies just outside the plan area along the northwestern boundary.

**Surface Water Runoff and Flooding**

As forested and natural vegetative cover are replaced with development, surface water runoff (stormwater) tends to increase both in volume of runoff and rate at which the water drains off the land. Stormwater that has not been properly addressed can result in flooding, water quality and habitat degradation, negative impacts to fisheries, and erosion. Stormwater related issues can be correlated to the amount of impervious surface within a watershed or basin. Although total impervious surface area accompanying development is not the only factor in stormwater related issues, it is a readily measurable indicator that can be tracked and correlated to stormwater problems. Another indicator that is more difficult to measure, but can be correlated with more reliability, is effective impervious area. [Note: Effective impervious surfaces occur when impervious surfaces are directly connected to one another and the water flow is not interrupted by any pervious areas.] Recently published research indicates that water quality problems and habitat degradation start occurring when a watershed reaches approximately 10% effective impervious surface. This percentage can be reached with a density of as little as one home per acre because of the network of roads needed to support this type of development.

Historically, for the smaller storm events, runoff would stay on a site trapped in numerous small depressions and saturate the top several feet of soil. Flooding would occur only during larger storm events; when the soil was completely saturated, the water would then be conveyed downstream. As development has occurred, many of the small depressions were graded smooth and the top several feet of soil were removed or compacted. This type of development removed the ability of the land to contain the smaller storm events and subsequently flooding started to become a problem at even the smaller events. Increases in the number and capacity of connected drainage systems, in the form of ditches and pipes meant to drain properties and remove water quickly, also increase stormwater problems downstream.

The increase in rate and volume of water from development has caused chronic surface water flooding problems, especially at the convergence of North Fork Clover Creek and along the main stem of Clover Creek. The main Clover Creek channel has its headwaters located south of 160th St. E. about halfway between Canyon Road and Meridian Avenue. Flows in this portion of Clover Creek are generated from a combination of surface water runoff and groundwater leaching out of slopes into the creek. Downstream of the confluence point, some serious flooding has occurred where Clover Creek and North Fork Clover Creek merge. This flooding occurs about every two years, but sometimes as frequently as yearly. Some flooding events have inundated houses near B Street and 136th Ave. E. and a few of these homes have been purchased in the last several years using Federal Emergency Management Agency (FEMA)
funds. In 1996, Clover Creek flooded portions of Highway 7. Portions of B Street and 136th Ave. E. have also experienced flooding from Clover Creek. During the 1996 and 1997 storm events, flooding occurred where Clover Creek crosses under C Street and a few homes incurred water entry at the first floor level.

The portion of Clover Creek located parallel to and south of Tule Lake Road is a manmade channel that was originally designed by the Corps of Engineers to be the overflow channel for the main Clover Creek channel. The main Clover Creek channel originally traveled to the north through Pacific Lutheran University. In the 1960s, all of Clover Creek’s flow was diverted to the overflow channel and over the years much of the original channel was filled in. Isolated low points on the original channel experience flooding during large storm events from a combination of surface water flows and rising groundwater.

At the intersection of Spanaway Loop Road and Tule Lake Road, Clover Creek deposits into a large marshy area east of Spanaway Loop Road. This wetland provides a large floodplain for the creek to spread out. It becomes quite congested with reed canary grass that tends to inhibit base flow during the summer. There have been no flooding reports of homes or roads.

The tributaries that comprise North Fork Clover Creek drain the plateau area north of Brookdale Road and south of Highway 512. Because of the impermeable soil types found in this area, flows generated in the North Fork system tend to be flashing runoff, which passes through the system quickly. Land use practices in the area tend to fill in low spots in the topography that increase drainage networks, which results in even quicker surges in flow.

Spanaway Creek leaves Spanaway Lake traveling north and splits into two creeks, Maury Creek and Spanaway Creek. Spanaway Creek continues north conveying water to Tule Lake. Maury Creek travels west, eventually converging with Clover Creek before traveling under McChord AFB. The channel of Spanaway Creek, north of the split into Maury Creek, is well-defined and was probably originally manmade to protect farming land. The channel becomes increasingly clogged with vegetation such as cattails, iris, reed canary grass, willow, and alders as it extends north of 138th St. S. and nears Tule Lake. Reports of flooding along this system have been non-structural flooding (e.g., low yards, driveways, and off-channel low spots). Although most flooding is attributed to surface flooding and overtopping of Spanaway Creek, the off-channel flooding is likely due to groundwater surfacing as it moves from southeast to northwest. Maintenance to increase the channel capacity and reduce flooding impacts associated with Spanaway Creek is becoming more difficult due to the negative effects this activity has on fish habitat.

**Groundwater Flooding**

Flooding associated with high groundwater tables is common in Parkland and Spanaway. Because of the porous soils, most of the runoff is infiltrated and charges the shallow groundwater aquifer. Flooding frequency can be associated with the total precipitation in a water year or subsequent water years.

While development activities exacerbate groundwater flooding problems by reducing vegetation and increasing surface water, how much additional flooding is produced is unknown.
However, anecdotal evidence suggests that even before a majority of the development occurred within the plan area, groundwater flooding was documented corresponding with years of large cumulative rainfall. Unfortunately, adequate mapping of areas prone to groundwater flooding is currently not available as these areas are generally not shown on the Flood Hazard Area maps produced by FEMA which primarily focus on flooding associated with creeks or rivers.

Several areas within the plan area are prone to groundwater flooding. The area south of 138th St. E., which is an off-channel of Clover Creek, is susceptible to such flooding. Groundwater has also flooded the cul-de-sac of 139th St. E., inundating roads, driveways, and crawl spaces. The drainage system for this development was installed as an infiltration system that works fine when groundwater is low, but operates in reverse when groundwater is high.

**Drainage Districts**

Drainage districts are empowered under Washington State laws as junior taxing agencies to address specific drainage-related problems within limited areas. There are two drainage districts, 14 and 19, which are located within the communities plan boundary.

Drainage District 19 lies within the Chambers/Clover Creek Watershed, encompassing the North Fork tributary to Clover Creek. The district boundaries extend between 80th Street E. and 128th Street E. and from A Street to Portland Avenue E. Drainage problems within this area include a lack of maintenance of conveyance channels and natural drainage swales.

Drainage District 14 lies within the Puyallup Watershed, with primary conveyance into Swan Creek. The district service area is located between 80th Street E. and 121st Street E. and between Vickery and Portland Avenues. This area experiences the same problems as Drainage District 19, but also has capacity problems and severe erosion and sediment problems on Swan Creek.

**Current Regulations**

In response to Federal Clean Water Act mandates, the County began a major update of the site development/stormwater management regulations in the early 1990s. In 1995, the Washington State Department of Ecology (DOE) issued a National Pollutant Discharge Elimination System (NPDES) Stormwater Permit to Pierce County, which included a mandate that Pierce County adopt a stormwater manual that was equivalent to the DOE manual for the Puget Sound region. The Pierce County Council adopted a revised Stormwater Management and Site Development Regulation and companion manual in November of 1997. The new manual requires increased measures to provide erosion/sediment control and protect water quality, and provisions for sizing of stormwater facilities to protect downstream areas from negative impacts associated with increased flows. The new manual does not, however, address the total increase in the volume of water leaving the site, nor does it discuss stormwater Best Management Practices (BMPs) or techniques for low impact development.

Flood hazard areas are regulated under Pierce County Title 17A which contains regulations that are more restrictive than the Federal Emergency Management Agency (FEMA) guidelines and
most other jurisdictions in Washington State. The flood hazard regulations have requirements to determine areas of deep or fast flowing water and prohibit development within those areas if they meet the flood hazard definition.

**GROUNDWATER**

The entire plan area is underlain by the Clover/Chambers Creek Aquifer system. Over 50% of the area is designated as a Wellhead Protection Area. Because of the highly permeable gravelly soils, it is estimated that approximately 50% to 60% of precipitation has the potential to become groundwater recharge. The depth of groundwater in the area ranges from one to more than 100 feet.

The groundwater aquifers supply drinking water for over 270,000 residents of Pierce County and, for more than 170,000 of these residents, the aquifers serve as the sole source of drinking water. At the end of the 1970s, studies conducted by the Washington State Department of Health (DOH) indicated that water quality within the Clover/Chambers Creek shallow aquifer was deteriorating and the levels of nitrates, chlorides, and bacteriological contamination were increasing. In the early 1980s, a number of significant site-specific groundwater contamination problems, generally involving toxic chemicals, were discovered in wells in the Parkland area.

In response to the deterioration in groundwater quality, the Tacoma-Pierce County Health Department (TPCHD) and the DOE commissioned the preparation of a hydrogeologic study in the Clover/Chambers Creek Watershed. The results of this study, completed in 1985, revealed the extreme vulnerability of the aquifer system to contamination from the overlying land use activities and identified the geographic areas that were subject to the highest risk of groundwater contamination. In 1993, the EPA designated all of the area within the Chambers/Clover Creek Watershed, which includes the entire plan area, as part of a Sole Source Aquifer System which enables limited federal protection to drinking water supplies and federal financially-assisted projects and grant funding.

Two geographical areas also identified for additional protective measures are Wellhead Protection Areas and areas where aquitards are absent. In 1997, the County Council established Wellhead Protection Areas countywide in response to information provided by the TPCHD. Wellhead Protection Areas receive a higher level of protection because they represent the most severe threat to drinking water supplies should an incident of contamination, such as a toxic chemical spill, occur. A large portion of the Parkland community contains a designated area where aquitards are absent. Currently, there are no special provisions that address these aquitard areas.

**CURRENT REGULATIONS**

Title 18E Development Regulations-Critical Areas regulates land use activities within the Clover/Chambers Creek Basin boundary, the two highest DRASIC zone boundaries, and the established Wellhead Protection Areas. In 1997, Chapter 18E.50 Aquifer Recharge Areas was comprehensively updated to establish specific mitigation measures for certain regulated activities, such as subdivisions of land, residential structures, commercial and industrial sites, which do not include hazardous substance processing or handling, and storage tanks.
addition, this chapter requires a hydrogeologic assessment for any activities that process or handle hazardous substances, such as waste treatment facilities, landfills, and animal containment areas, and grants the County the authority to condition or deny an application based upon the TPCHD’s evaluation of potential impacts to the underlying aquifer.

**Water Supply**

At this time, the availability of groundwater within the Spanaway community for future development is a major issue. Spanaway Water Company has currently placed a moratorium on issuance of any new water availability certificates pending approval from the DOE to drill a new well. Parkland Light and Water and SE Mutual Water Company have both indicated that current water availability is adequate to serve projected development within their district boundaries. The TPCHD has initiated a watershed plan, under State legislation ESHB 2514, within the Clover/Chambers Creek watershed to help determine groundwater availability and allocation of groundwater within the Water Resource Inventory Area (WRIA 12). This planning effort will also analyze water quality and habitat issues, which are related to water supply issues. For additional discussion on potable water supply issues, see the Facilities and Services Element.

**Water Quality**

Threats to water quality within the plan area come from everyday sources such as agriculture, forest practices, septic systems, stormwater, construction activities, recreation (boats and marinas), road runoff, and residential activities. These sources are referred to as “nonpoint” sources of pollution. It has been estimated that more than 50% of water quality problems in the area are attributable to nonpoint sources of pollution.

The biological health of creeks and streams in the area ranges from poor to moderate. Most of the streams that have been sampled have had fecal coliform bacteria levels which are in violation of State water quality standards. Clover Creek has had pH levels (a measure of acidity and alkalinity) which are both too high and too low to meet State standards. Spanaway Creek has had pH levels which are too high. The United States Geologic Service (USGS) found problem levels of copper, lead, and zinc in Clover Creek and its tributaries.

Spanaway Lake is spring fed by the wetland complex and stream located at the southeast corner of the lake. DOE and TPCHD monitor water quality in Spanaway Lake. The Lake has experienced numerous blue-green algae blooms in recent history. A toxic algae bloom in 1995 and high levels of fecal coliform in 1998 resulted in a recommendation that people not swim in the lake. These algae blooms may be the result of nutrient loading from tributaries as well as fertilizer runoff from the park, golf course, and adjacent residential lawns. A high population of Canada geese also contributes to the reduction in water quality and clarity in the lake.

Although Spanaway County Park is on the sanitary sewer system, the shoreline residences around Spanaway Lake are still served by on-site septic systems. These systems, if not operated and maintained properly, adversely impact water quality. To address this concern, the TPCHD mailed information on the operation and maintenance of on-site sewage systems to all residences within 300 feet of Spanaway Lake in the summer of 1999.
Groundwater is of concern and has been for many years. While beneficial uses of on-site septic systems are recognized, some systems have shown signs of problems. In May 1971, the DOE required Pierce County to pursue installing sewers in portions of the plan area in an effort to prevent groundwater contamination. However, even with the installation of sewers, some water companies have reported an occasional need to treat groundwater because of coliform bacteria levels that exceed acceptable thresholds.

**Current Regulations**

There are a number of things that can be done to protect water quality. Many are included in the *Chambers-Clover Creek Watershed Action Plan, Lower Puyallup Watershed Action Plan*, and Pierce County’s *Stormwater Pollution Prevention Manual: A Guide to Best Management Practices for Industries, Businesses, and Homeowners*. Pierce County Title 17A contains requirements for stormwater Best Management Practices (BMP). The main purpose of these regulations is to increase the quality of stormwater prior to discharge into surface water bodies and groundwater supplies.

**Shorelines**

The Washington State Shoreline Management Act (SMA) provides for the management of water bodies identified as “shorelines of the state.” In the Parkland-Spanaway-Midland Communities Plan area, these include Spanaway Lake, the main stem of Clover Creek, and Spanaway Creek. Areas under jurisdiction of the SMA include the water bodies, all lands within 200 feet of the ordinary high water mark, and associated wetlands and floodplains.

Spanaway Lake, covering 262 acres, is used primarily for recreation, with the predominant land use bordering the lake being single-family residential. Extensive areas surrounding the lake have been identified as wetlands or 100-year floodplains. Spanaway Creek flows north from Spanaway Lake, through Bresemann Forest and Tule Lake, and into Clover Creek west of Tule Lake Road and Spanaway Loop Road.

Clover Creek enters the PSM area immediately south of Brookdale Road and flows generally west, crossing Pacific Avenue near 132nd Street South. The creek has been diverted west of Pacific Avenue, following an artificial channel south of Tule Lake Road. The Pierce County Shorelines atlas shows the original channel of Clover Creek, through the Pacific Lutheran University campus, to be a channel subject to the SMP. The creek exits the plan area onto McChord AFB, west of Tule Lake Road and Spanaway Loop Road. Several stretches along the creek and a large area west of Spanaway Loop Road have been identified as either wetlands or within the 100-year floodplain.

Other streams within the plan area, including Maury Creek, Coffee Creek, and the North Fork of Clover Creek, have not been identified as shorelines of the state, as they have been determined to have a mean annual flow of less than 20 cubic feet per second. If it is demonstrated that their flows exceed this threshold, they could then be included as shorelines subject to SMA.
CURRENT REGULATIONS

The Pierce County Shoreline Master Program (SMP), adopted by Pierce County under the SMA, currently includes five Shoreline Environments: Natural, Conservancy, Rural, Rural-Residential, and Urban. All shorelines are given a Shoreline Environment designation which reflects current conditions and identifies the type and intensity of allowed development. Shoreline Environment designations in the plan area include Conservancy, Rural-Residential, and Urban. The Conservancy Environment designation is the most restrictive. The Rural-Residential and Urban Environments allow a variety of uses at fairly intensive levels.

Spanaway Lake lies in the Urban Environment, except for the shoreline area within Spanaway Park which is in the Conservancy Environment. Spanaway Creek is in the Urban Environment, and Clover Creek is in the Rural-Residential Environment east of 14th Avenue East, and in the Urban Environment west of that point.

The Department of Ecology has developed SMP guidelines to assist local jurisdictions in preparing updates to their local SMPs. The guidelines are intended to reflect our current understanding of shoreline functions and processes, and problems related to shoreline management that have evolved in the thirty years since the SMA was initially adopted. Vegetation management, design and location provisions for bulkheads, piers, and docks to improve protection of natural shoreline processes and salmon habitat, and development limitations on flood prone areas are examples of issues included in the guidelines.

WETLANDS

Wetlands are protected under the Federal Clean Water Act, the State Growth Management Act, and Pierce County Codes. Wetlands are those areas identified by the presence of water during the growing season, hydric soils, and the presence of a plant community that is able to tolerate prolonged soil saturation. Wetlands provide important environmental functions including reducing the impact or frequency of flooding, providing habitat, recharging aquifers, providing clean water for fish and other aquatic species, and preventing shoreline erosion. Wetlands also provide visual buffers in the built landscape.

It is estimated that 50% to 67% of the total wetland acreage in Washington State has been lost since European settlement, and that 90% to 98% of urban area wetlands have been lost in the Puget Sound region. There are currently no estimates for how much wetland area has disappeared within Parkland-Spanaway-Midland, however, there is evidence that much of the area along Pacific Avenue and Clover and Spanaway Creeks which historically supported wetlands, has been filled.

The plan area currently contains both isolated wetlands and wetlands which are adjacent to creeks and Spanaway Lake. In addition, there is a strong correlation between designated Flood Hazard Areas and wetlands. Many of the scattered wetlands in the plan area are elongated troughs that are the result of underlying Dupont muck soils that formed when the glaciers receded. Some of these wetlands are bogs that formed as pre-historic lakes have filled in over time.
There are several significant wetland complexes within the plan area. One is located at the confluence of Spanaway Creek and Clover Creek, west of Spanaway Loop and Tule Lake Road. Another wetland complex, located to the southwest of Spanaway Lake, is part of a larger wetland system that extends to the south into Fort Lewis. There is still a partial system of wetlands located adjacent to both Clover Creek and Spanaway Creek. Finally, there are still some large category 2 wetland complexes located within the Midland community. (See Map I-6: Wetlands)

Unfortunately, some of the remaining wetlands have incurred significant impacts to their environmental functions as a result of human activities such as construction and development, ditching, draining, filling, and channelized stormwater infiltration. Some examples include: Midland wetlands, Clover/Spanaway Creek complexes, Spanaway Lake complex, and the wetland complex located just south of Pirnie Road and 203rd St. Ct. E.

**CURRENT REGULATIONS**

Pierce County Title 18E regulates development activity within wetlands including: removing, excavating, disturbing soils, or dredging; dumping, discharging, or filling; draining, flooding, or disturbing the water level or table; construction or placing obstructions; altering vegetation; activities which result in changes to water temperature; application of pesticides or other chemicals; and divisions of land. Unfortunately, the provisions within this Title do not apply to development applications filed prior to the adopting ordinance (February 1992), many of which may still be in the application process.

**FISH AND WILDLIFE RESOURCES**

**BENTHIC INVERTEBRATES**

All aquatic organisms, both plants and animals, have preferred environments such as clear or turbid water; warm, cool, or cold water; rock, sand, or silt bottom; high or low oxygen levels; small or large streams with slow or fast flowing water. Each species’ physiology, behavior, morphology, and ecology have independently evolved to adapt to these preferences and co-evolved to depend on other species during the course of their individual life cycles. Furthermore, no species can survive outside the biological context and parameters that sustain it.

Benthic (bottom-dwelling) invertebrates, also referred to as macroinvertebrates, include animals like aquatic insects (mayflies, stoneflies), snails, clams, crayfish, and aquatic worms. They live in a variety of freshwater bodies including rivers, streams, wetlands, ponds, and lakes. Benthic invertebrates that inhabit streams, creeks, and rivers need adequate hydrologic, channel, and vegetation functions to survive and multiply and in turn serve as a food source for resident fish populations.

The health of an aquatic ecosystem depends on all of the biological components that comprise its system, not just on the size of commercially or culturally important populations such as salmon. Most water management in the last two decades has emphasized water quality, with a
particular focus on monitoring chemical pollutants, to determine the health of an aquatic system. However, human actions jeopardize the biological integrity of water resources by altering one or more of five principal factors:

- physical habitat;
- seasonal flow and quantity of water;
- the food base of the system;
- interactions within the stream biota; and
- chemical contamination.

As humans alter their natural environment, changes in the benthic invertebrate population can also be used to help evaluate the condition or health of the water bodies contained within a watershed. Human activities that might have an effect on a freshwater body and its biota include the release of human and livestock waste; toxic chemicals; fertilizers and pesticides from farmlands, residential lawns, recreational fields, and golf courses; and tree and other vegetation removal that cause increased water temperatures.

The biological health of a water body can be determined by conducting benthic invertebrate sampling to evaluate the species richness (undisturbed environments generally have a greater number of species), species diversity, frequency of individuals, and total volume of organisms. A sampling that indicates a fairly healthy stream is comprised of organisms that are intolerant to pollution, such as dobsonfly larva, mayfly nymph, water penny, caddisfly larva, and stonefly larva. As water quality and stream channel conditions deteriorate, many of the above organisms cease to live within the stream and are replaced with organisms that are generally tolerant of pollution and can live in an environment that is high in sediments. Organisms surviving under these deteriorated conditions include black fly larva, leeches, aquatic worms, rat-tailed maggots, and left-handed snails.

In the summer of 1999, two streams within the plan area, Clover Creek and Spanaway Creek, served as test sites for a class on sampling benthic macroinvertebrates. The Clover Creek sampling area was located between Tule Lake Road and 131st Street South just west of 10th Avenue South. Spanaway Creek was sampled just north of Military Road South in the Bresemann Forest. The results of this class were fairly rudimentary, but offered a glimpse at the variation in the health of these two streams. The Clover Creek sampling indicated species that were generally tolerant of pollution and high levels of sediment. Species found in the sampling on Spanaway Creek were those that are typically less tolerant to pollution and prefer stream bottoms that are composed of well-aerated, loose gravel.

**Fish**

Three anadromous fish species, Coho salmon (*Oncorhynchus kisutch*), steelhead trout (*Oncorhynchus mykiss*), and coastal cutthroat (*Oncorhynchus clarki clarki*), are identified on the revised Washington State Department of Fish and Wildlife (WDFW) Stream Net Maps as known or predicted to occur within the plan area. (See Map I-7: Fish and Wildlife Resources) Coho, also referred to as silver salmon, are indicated as a known presence in Spanaway and Clover Creeks. Steelhead, also referred to as sea-run rainbow trout, are indicated as a predicted
presence in Spanaway Creek. Coastal cutthroat, also referred to as sea-run cutthroat, are indicated as a known presence in Clover Creek. The status, origin and type, and spawning information for each known or predicted species within the plan area is depicted in Table I-5.

*Information from the 1992 Washington State Salmon & Steelhead Stock Inventory (SASSI), WDFW and from interviews with WDFW staff.

In 1992, WDFW listed the Coho status in the Chambers/Clover Creek system as healthy. These fish were identified as a mixed (hatchery/native) origin with a composite production type (i.e., sustained by both wild and artificial production). The 1999 Coho return in Clover Creek was comprised of 100% unmarked fish (i.e., a product of natural spawning). Therefore, while the status of Coho in Clover Creek is listed as healthy, the actual current status (year 2000) is questionable. This is because of the consistent trend of decline in the south Puget Sound species and the fact that previous numbers were heavily comprised of hatchery fish that are no longer returning. In addition, Coho in the Puget Sound are currently listed or currently being considered for under the federal Endangered Species Act (ESA).

The 1992, WDFW data did not list a Chambers/Clover Creek steelhead stock. It is assumed that the remaining wild steelhead are of mixed origin in this system. The current stock status is assumed depressed within Clover Creek by WDFW staff, as return numbers since 1995 have been a maximum of 64. In 1999, there were only 28 reported returns. As with Coho, steelhead are also under consideration for listing under the federal ESA.

Currently there is no information available on the status of coastal cutthroat within the Chambers/Clover Creek system. No hatchery operations exist on this species so any fish that are returning are considered native/wild. All cutthroat trout populations in Washington have been listed as a candidate species under the federal ESA.

All three species of fish require the same elements within the natural environment to conduct their life cycles, including:

- Cool, clear flowing waters to support returning adults, for eggs to hatch, and for young to survive and grow until they migrate to sea;
- Adequate flow during crucial times to make migration possible, to allow fish to escape predators, and to allow fish to find enough food;
- Well-aerated, loose, clean streambed gravel for spawning;
- A rich diversity of benthic invertebrates to serve as a food source during juvenile rearing;
- Adequate off-channel juvenile rearing areas (adjacent wetlands serve this function) may use lakes and beaver ponds for rearing where available;
Appropriate streamside vegetation to keep the water cool, provide a buffer against soil erosion to maintain water quality, source of food and nutrients for streams, and source of large woody debris (LWD) which plays a key role in the formation of the physical habitat and storage of sediment and organic matter.

Since the majority of the Midland area drains into and thereby impacts Swan Creek, it is relevant to note that this system contains several anadromous fish species including Coho salmon, chum salmon, and winter steelhead. Chum salmon also rely on estuarine environments that support aquatic vegetation and organisms. The juvenile chum utilize these areas (e.g., eel grass beds) during rearing until going out to sea.

**WILDLIFE**

The Parkland-Spanaway-Midland plan area supports a variety of wildlife species. Many of these species are identified as critical. These critical species depend on a variety of habitat types to support their life cycles, including wetlands, riparian areas, prairies, oak woodlands, and coniferous forests. The chipping sparrow and the western gray squirrel are two species that are heavily dependent on the remaining oak woodland/prairie mosaic habitat. The Spanaway Marsh area has a resident bald eagle that ranges from Spanaway Lake to the wetland marsh complex extending south into Fort Lewis. In 1985, Spanaway Marsh also supported an active great blue heron rookery. Several factors could have caused the great blue heron to abandon this location, but given the high quality habitat, this area is likely to support great blue heron in the future. Pileated woodpeckers have been sited by Midland residents in the vicinity of 85th Street E. and 22nd Avenue. (See Map I-7: Fish and Wildlife Resources)

Five potentially critical butterfly species may be found in the plan area including Oregon Silverspot, Zerene Fritillary, Puget Blue, Mardon Skipper, and Whulge Checkerspot. All of these butterflies have been identified on Ft. Lewis where extensive inventories have been done. It may be assumed that all of these butterflies may be found in the southern Puget prairies which include Parkland, Spanaway, McChord AFB, DuPont, Lakewood, etc. The Zerene Fritillary is associated closely with white-topped aster (*Aster curtus*), a rare prairie plant, which is found within Parkland. The Puget Blue associates with lupines; the Mardon Skipper with Idaho fescue and the blue violet; and Whulge Checkerspot with lomatium, camas, plantain, etc., also known to grow within the plan area. Four of these butterflies have been listed by the State as a candidate species.

* Indicated at-risk species through the GAP pilot project.
Management considerations vary greatly depending upon the particular species, but some generalizations can be made, including:

- Avoid human impacts on nesting and breeding sites;
- Maintain habitat types which support the species life cycle;
- Provide connectivity of habitat which supports wildlife movement corridors;
- Assess the potential for habitat restoration actions;
- Establish adequate buffering requirements for important habitat features such as snags, nest sites, caves, spits, wetlands, riparian zones, etc.;
- Implement additional regulations for winter recreational activities;
- Review and mitigate adverse impacts to critical species prior to conducting logging and development activities within a site;
- Require designated habitat areas be protected through adequate staking and signage during the construction and post-construction phases of development.

**Fish and Wildlife Habitat**

**Priority Habitats in the Plan Area**

Even within highly urban areas, pockets of high quality habitat can remain. The WDFW designates priority wildlife habitats and this information was generated for the plan area with the following habitats identified:

The Midland community contains only a few small areas of priority habitat generally located west of Golden Given Road. These habitat areas are primarily elongated troughs, associated with designated wetland areas.

Within the western portion of the Parkland community, three major priority habitat areas exist as follows:

- east of Steele Street just south of 96th Street S.;
- east of Steele Street both to the north and south of 112th Street; and
- west and east of Spanaway Loop Road around Tule Lake Road.
- Again, these Parkland priority habitat areas are associated with designated wetland areas, but also reflect small vestiges of prairie habitat.

There are several large priority habitat areas designated within the Spanaway community including:

- an area surrounding Spanaway Lake which extends north along the south fork of Spanaway Creek and south (referred to as Spanaway Marsh) onto Fort Lewis;
- between 176th Street E. and 186th Street E. at 8th Avenue E.;
- a linear riparian corridor adjacent to the south fork of Clover Creek; and
- the southwest corner of 176th Street E. and 22nd Avenue E.
- These areas provide a range of habitat types including urban natural open space (primarily forested), wetlands, riparian zones, and waterfowl range.
Pierce County Planning and Land Services Department, in conjunction with other County departments, recently completed a wildlife biodiversity plan for Pierce County (see Pierce County GAP Application Pilot Project). The purpose of this study was to identify those areas within Pierce County that provide for the greatest diversity of species, based upon existing land cover (vegetation zones) and the concepts of species richness and representation. These areas were mapped as Biodiversity Management Areas (BMAs). Corridors between the BMAs were also established to facilitate wildlife movement, and in many cases, these corridors were located along riparian areas. The results of this study served to augment the existing WDFW Priority Habitat and Species (PHS) and Heritage Point data and expand the current focus on threatened, endangered, and monitored species to a more holistic view.

One designated BMA was located partially within the boundaries of the plan area (denoted as the Upland BMA), and this area was one of four chosen for further refinement in the phase II portion of the pilot project. The refined plan area BMA (PSM Case Study Area) should be considered a habitat area of high quality. It should be noted that while the PSM plan does not specifically recognize lands outside the planning boundaries, the military lands of McChord Air Force Base and Fort Lewis provide the high quality core of BMA habitat, which supports species that may peripherally use the plan area as edge habitat.

Prairies and oak woodlands are rapidly declining, both within the Puget Sound region and within the plan area. Both the prairies and the oak woodlands provide habitat for several critical species identified within the plan area including the Western gray squirrel, chipping sparrow, and Townsend’s big-eared bat. Species that utilize wetlands during some or all phases of their life cycle have also seen declines as wetlands have been eliminated or functions and values impacted as a result of urban development. Future protection of prairies, oak woodlands, wetlands, mature forests, snags, and priority habitat areas is essential to maintaining the long-term viability of fish and wildlife species in the plan area.

**Habitat Quality**

Extensive land use conversion within the plan area has resulted in fish and wildlife habitat that is extremely fragmented and degraded. This fragmentation of urban habitat leads to extinction of larger predators, overpopulation of smaller predators, excessive predation by domestic animals, decrease in the benthic invertebrate population, decrease in fish population, and an overall reduction in the biological diversity within the area.

**Current Regulations**

The Fish and Wildlife Chapter (18E.60) identifies critical fish and wildlife habitats as either those areas which have a primary association with federally or state-listed endangered, threatened, or sensitive species and habitats and species of local importance. Section 18E.60.020 B.1.b.(2) lists documented habitat areas or outstanding potential habitat areas for endangered, threatened, sensitive, candidate, or monitored species. These areas include specific habitat types which are infrequent in occurrence in Pierce County and may provide specific habitats with which endangered, threatened, sensitive, candidate, or monitored species have a primary association, such as breeding habitat, winter range, and movement corridors. Oak woodlands,
prairies, old growth forests, caves, cliffs, rivers and streams with critical fisheries, and snag-rich areas are listed as habitats of local importance. As discussed earlier in the vegetation section, percentages of oak and prairie habitat/vegetation removal are currently negotiated on a case by case basis during the application review process and thorough identification of these areas is limited by inadequate mapping.

Habitat adjacent to rivers, streams, and rural lakes is protected by the requirement to maintain a buffer of undisturbed vegetation (also discussed under the section on vegetation). At this time, best available science indicates that the 35-foot buffer, currently required for all regulated watercourses within the planning area, is generally inadequate to protect the aquatic ecosystem from the negative impacts associated with traditional development practices.

**Open Space**

**History of Open Space in Pierce County**

Since 1972, the County has offered a Current Use Assessment (CUA) Program. This program provides property owners with a tax reduction incentive to maintain properties in a productive agricultural land, timberland, or open space land condition. At present time, there are approximately 300 properties enrolled under the open space category of the CUA Program. In the summer of 1999, the administrative procedures for the CUA program were revised and a public benefit rating system (PBRS) was adopted as a means of ranking applications for the CUA open space category.

The County Council approved the Conservation Futures Program in 1991. Establishment of this program authorized the County to collect a real estate property tax (6 1/4 cent per $1,000.00 of assessed valuation) for the acquisition of open space properties or conservation easements. To date the County has collected 8.4 million dollars and purchased or preserved 32 properties/conservation easements including open space sites like the Parkland Prairie and Wildlife Preserve and Clover Creek properties.

In 1995, the County’s newly adopted Comprehensive Plan was appealed to the Central Puget Sound Growth Management Hearing Board (GMHB)—one of the issues appealed was the lack of open space/greenbelt policies and map. In response to the GMHB’s decision, the County Council adopted a set of open space policies and an open space/greenbelt map in 1996. These policies included direction to form an Open Space Implementation Committee (OSIC) as a forum to comprehensively address open space issues at the countywide scale. The County Council moved forward in implementation of these policies in 1997 and created the OSIC whose main tasks were to explore and address several open space issues identified in Comprehensive Plan Land Use Element Objective 57A. including:

- Establish countywide open space priorities;
- Develop a Public Benefit Rating System for ranking Current Use Assessment Open Space applications;
- Recommend amendments to existing County codes and regulations that address open space;
- Refine the open space/greenbelt map to reflect open space priorities;
- Conduct a countywide inventory of land parcels with high priority for preservation purposes;
- Complete an inventory of existing publicly owned properties and evaluate them for their value as open space;
- Identify action steps for acquiring the open space areas mapped on the revised open space/greenbelt map; and
- Investigate the feasibility of using or earmarking revenues received from payment of back taxes on current use assessment properties, for acquisition of open space.

Over a two-year period, the County Council took action on several of the Open Space Implementation Committee’s (OSIC) recommendations. In March 1998, the County Council adopted Ordinance 98-2, Chapter 19D.170 Open Space Priorities. These priorities were established for any County program that provides for the preservation of open space. In June 1998, the OSIC submitted a proposed set of code amendments, which revised Chapter 2.114, Current Use Assessment Program Administrative Procedures to include a Public Benefit Rating System that was consistent with the open space priorities, and Chapters 2.96 and 2.97, Conservation Futures to be consistent with the open space priorities. Finally, on October 5, 1999, the County Council adopted the T-9 Comprehensive Plan text amendment which established a revised open space/greenbelt map based upon the high priority open space categories identified in Chapter 19D.170 (critical salmon habitat, fish and wildlife habitat, wetlands, tidal marshes, estuaries, rivers and streams, marine waters, and wooded areas). These areas will receive the highest priority for any Pierce County programs that acquire or otherwise preserve lands for open space. During this map amendment process, the sources to delineate the fish and wildlife habitat category were also expanded to address a biodiversity management network as defined through the Pierce County GAP Application Pilot Project [Note: refer to the Natural Environment Element, Fish and Wildlife Resources Section for more information about the Pierce County GAP Application Pilot Project.]

**Pierce County Comprehensive Plan**

The Pierce County Comprehensive Plan contains several policies that address open space. Section 19A.30.170 establishes general criteria on areas that should be considered for open space. The open space/greenbelt areas within the County are depicted in the map referenced in policy 19A.30.170 I. Section 19A.30.130 Objective 57A states that County programs which provide for preservation of open space shall have established priorities and these priorities will be used to rate open space proposals for Conservation Futures funding, Open Space Current Use Assessment taxation, Development Regulations bonus densities, and other County programs which acquire or preserve open space areas. 19A.30.130 Objective 59B sets forth policies on the management and stewardship of County-owned open space lands. Finally, 19D.170 identifies the County’s open space priorities grouped under high, medium, and low priorities.
Pierce County Comprehensive Park, Recreation, and Open Space Plan

The Pierce County Comprehensive Park, Recreation, and Open Space Plan (referred to as the Parks Plan) provides general direction and guidance for both facilities and programs. The Parks Plan does not contain site-specific plans for each of the County’s properties. These site-specific plans have been prepared, modified, and implemented as needed over the decades. One example of a site-specific open space plan is the newly developed Parkland Prairie Management Plan.

Pierce County Development Regulations

As previously mentioned there are several Pierce County regulations that deal specifically with open space. Chapter 2.114, PCC contains the County’s administrative procedures for implementing a tax reduction program under the Current Use Assessment Program and Chapter 2.96 and 97, PCC sets forth the procedures for County acquisition of open space lands under the Conservation Futures Program. Title 18A Development Regulations-Zoning, Section 18A.35.025 contains standards for minimum residential amenities which include provisions for on-site open space areas. Section 18A.35.050 addresses open space issues such as density incentives, open space location and designation criteria, permitted uses, classification mechanisms, and public access.

Other open space programs lend themselves to protection and restoration of various designated open space areas. Pierce Conservation District “Stream Team” efforts, and those of other local environmental organizations, work to enhance and restore degraded riparian areas.

Existing Publicly Owned Open Space Sites

The Parkland-Spanaway-Midland Communities Plan area contains several designated open space sites, which are shown in Table I-8.

Table I-8: Pierce County Owned/Purchased Open Space Sites

<table>
<thead>
<tr>
<th>Site</th>
<th>Acres</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parkland Prairie &amp; Wildlife Preserve</td>
<td>4.6</td>
<td>Located off Tule Lake Road, next to vacated Yakima Avenue on the east, 132nd Street on the south and 10th Avenue South on the west. The Parkland Prairie site is in the final stages of development of a management plan that calls for short and long-term restoration back to native prairie. The plan is a joint undertaking by the Clover Creek Council, Cascade Land Conservancy, Pierce County Parks and Recreation, and Pierce County Utilities – Water Programs. The final plan would be part of a memorandum of agreement and implemented by all four participants.</td>

<tr>
<td>-----------------------</td>
<td>-------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Clover Creek Wetland</td>
<td>2.24</td>
<td>Located on both the north and south banks of Clover Creek, southwesterly of the intersection of Golden Givens Road and Johns Road in Spanaway. The site straddles two channels of Clover Creek, approximately 700 feet in length. The channels over-bank often and the area is heavily vegetated. Trees on the site provide roosts for hawks, kingfishers, and herons as well as habitat for a number of fish and wildlife. The site is managed by the Cascade Land Conservancy, as part of the Clover Creek wildlife management area.</td>
</tr>
<tr>
<td>Clover Creek Dietrich</td>
<td>10.7</td>
<td>Located off 4th Avenue East, north of Cherry Street. The site is comprised of two parcels bisected by Clover Creek that contain 1,500 feet of non-contoured creek frontage. Several oak trees are found along the southern boundary of the site with open grassland between the creek and trees. The site provides roosts for hawks, kingfishers, and herons as well as habitat for a number of fish and wildlife. The site is managed by the Cascade Land Conservancy, as part of the Clover Creek wildlife management area.</td>
</tr>
<tr>
<td>Schibig-Lakeview</td>
<td>10.2</td>
<td>Located off Spanaway Loop Road at 12504 Spanaway Loop Road. The site is a historic inactive farm and offers habitat associated with the numerous oak trees found on the property. In addition, Clover Creek runs through the property and is home to several anadromous fish species including salmon and steelhead. Hawks, killdeer, and blackcapped chickadees have frequently been seen at this site.</td>
</tr>
<tr>
<td>Breseman Forest</td>
<td>65</td>
<td>Located on the north side of Old Military Road just west of Sprinker Recreation Center. The forest provides habitat associated with the old-growth fir stand found on the site. Spanaway Creek flows through a portion of the forest and additional riparian habitat is found in this area. The forest is criss-crossed with numerous walking trails and has been fenced to control access.</td>
</tr>
</tbody>
</table>

**Description of Desired Conditions**

Most people recognize the need to protect the ecosystems that support fish, wildlife, and humankind. Preserving the remaining fish and wildlife species and the native vegetation that provides the habitat for these species is of the utmost importance to the residents of the Parkland-Spanaway-Midland Communities Plan. Accommodating new growth while still maintaining the functions of the natural environment is a high priority. The following text describes the desired condition for each resource type in more detail.

**Air Resources**

Air quality within the Parkland-Spanaway-Midland Communities Plan boundaries is generally good; however, occasional jet fueling activities and emissions from McChord AFB pose localized air quality problems. A study of the air quality conditions associated with the military aircraft operations at McChord AFB should be conducted to establish a baseline inventory.
**Earth Resources**

**Landslide and Erosion Hazard Areas**

The Parkland-Spanaway-Midland Communities Plan area does not contain a significant amount of designated landslide and erosion hazards. However, there is a concern that the natural vegetation within a landslide hazard area needs to be retained to provide long term stabilization.

**Vegetation**

The communities place a high cultural value on the remaining prairies and oak trees and recognize that they provide important habitat for several resident critical or at-risk wildlife species. Preserving any remaining fragments of prairies and oak tree stands left within the plan area is a high priority.

Maintaining native vegetation, forested areas, and snags is also important for wildlife habitat and protecting water quality, especially near water courses and wetland areas. Better protection of native vegetation and its associated organic duff layer should occur. Restrictions on land clearing and tree removal (including snags) within the plan area should be implemented. Inventories should be conducted and special requirements developed for rare vegetation or slow growing trees. Replanting requirements should place a heavy emphasis on the use of native vegetation. Increased protection of designated native vegetation retention areas should be provided through the application of conservation easements, signage, and homeowners covenant maintenance agreements.

Urban stream buffer widths should be evaluated and increased as appropriate with the next substantive revision to the County’s Critical Area Regulations; however, during the interim, additional protection measures should be given to those streams which contain critical or at-risk salmonid species. Furthermore, restoration activities that involve vegetation removal, filling, or grading occurring within the riparian (hyporheic) zone, should be strictly regulated to ensure that no additional environmental system function degradation occurs.

**Water Resources**

**Surface Water Runoff and Flooding**

Surface water runoff should not negatively impact properties located downstream. As new development occurs in the future, the County should strive for near zero change in hydrologic function on the property through the application of low impact development techniques. The County should explore future revisions to the existing Site Development and Stormwater Management Regulations, which further reduce or eliminate the negative impacts of current development practices on the aquatic environment.
Those portions of the plan area that have historically flooded, such as B Street, 136th, and Tule Lake Road, should be analyzed to determine which areas should be preserved to provide adequate floodplain storage capacity and maintain hydrologic functions.

Areas within the plan boundaries where existing zoning densities will have the most detrimental impacts should be identified and either down-zoned, required to have low impact development strategies, or have CIP projects identified to mitigate impacts, to reduce the amount of impervious surface area and site disturbance. Current regulations should be amended to facilitate low impact development techniques within the County.

**Groundwater and Water Supply**

Groundwater supplies within the plan area should be protected and conserved. The groundwater studies done in the mid-1980s provided adequate information to identify the vulnerability of the Chambers-Clover Creek aquifer. Broad protection measures were enacted as a response to these studies. However, more detailed analysis and monitoring are necessary to determine if these regulations are achieving the goals of protecting groundwater quality and also to help identify more precise point locations for future increased regulatory efforts.

Water conservation measures should be implemented on a countywide basis in order to reduce the amount of waste that occurs with groundwater and surface water resources.

**Water Quality**

Aquatic ecosystems are supported in part by the level of water quality. Pollution and sedimentation caused from human actions and land development activities decreases water quality, thereby reducing the overall function of the aquatic environment. Inappropriate activities also have the potential to contaminate groundwater supplies, which provide potable water supply to the majority of the plan area. In particular, Clover and Spanaway Creeks and Spanaway Lake have been in violation of State water quality standards for fecal coliform bacteria, pH, copper, lead, and zinc levels.

Many pollutants and sediments are carried to surface water bodies by stormwater runoff. Instituting changes such as reducing the amount of impervious surface, disconnecting stormwater conveyance systems from direct discharge into water courses and bodies, and retrofitting stormwater Best Management Practices (BMPs) would serve to increase the level of water quality within the plan area.

Improving the way agricultural and forest practice activities are conducted can also help bring surface waters into compliance with State water quality standards. On-site sewage system requirements and practices that could potentially allow fecal coliform bacteria contamination into surface water and groundwater should be evaluated and, as necessary, amended. More emphasis should be placed on public education and outreach efforts that are geared towards reducing the impacts to water quality associated with typical household activities.

Other types of actions that could help increase water quality within the plan area include a lake management plan for Spanaway Lake, community stream/wetland restoration and monitoring, and establishment of a Chambers-Clover Creek Basin Advisory Committee.
**SHORELINES**

The Pierce County Shoreline Master Program (SMP) was adopted in two phases in 1974 and 1975. Since that time, conditions in shoreline areas in the Parkland-Spanaway-Midland communities have changed considerably as each community has grown, and the scientific understanding of natural systems and processes has evolved.

Shoreline Environment designations in the PSM area should reflect a balance between existing conditions and the current scientific information on shoreline habitats and processes. Developments in shoreline areas should be designed to recognize and protect wildlife habitat and native vegetation, water quality, and natural processes. Opportunities for providing public use and access to shorelines in the PSM area should be encouraged.

**WETLANDS**

Preserving the wetland areas that remain within the communities is a priority. Future development activities should be conducted in such a manner as to maintain the quality and function of the existing wetland complexes. Wetland restoration activities should be undertaken to increase the healthy functioning of wetland systems (both natural and artificially created) which may have been degraded as a result of development actions.

While the County’s new Wetland Management Regulations do offer a significantly higher level of protection, enforcement of these regulations continues to be a problem. Illegal wetland filling is still occurring at an alarming rate, and may be the result of either a lack of knowledge by the general public on wetland regulations or penalty and enforcement provisions which are not stiff enough to deter illegal actions. A comprehensive review of wetland penalty and enforcement provisions should occur to determine if these provisions are adequate to serve as a deterrent to illegal wetland activities.

Existing County wetland maps provide a fairly good indication of where wetlands may be located, however, the communities could benefit from a detailed inventory to more precisely identify and delineate existing wetland complexes. This type of an inventory could be used by the County in its upcoming buildable lands analysis and also in any public education/outreach efforts.

Property owners who have parcels of land that contain wetlands should continue to receive some assurance that a reasonable use of the property will be allowed in the future.

**FISH AND WILDLIFE RESOURCES**

Retention and preservation of existing fish and wildlife species and the habitats that support these species is a priority. Current riparian area buffer widths should be reviewed against the best available science and increased where existing standards do not adequately protect the functioning of the aquatic ecosystem. Acquisition of remaining high quality priority habitats within the plan area should be pursued and habitat management plans should be prepared for those sites that are acquired.
Implementation of low impact development techniques should be explored as a vehicle to stop continued degradation of remaining fish and wildlife habitat areas. In addition, partnerships for conducting public education and outreach efforts, which serve to increase the public’s awareness on the impacts of household activities on the healthy functioning of the natural environment (e.g., inappropriate fertilizer/pesticide application), should be pursued.

Inventories of remaining prairies and fish passage blockages should be conducted and the results of these inventories should be adopted as new critical area maps in the County’s Critical Area Regulations.

**OPEN SPACE**

Open space areas that serve as good fish and wildlife habitat should be protected through the designation of native growth protection areas that require the retention, and in some cases, the replanting of native vegetation. Enhancement, restoration, and maintenance of designated open space properties can be achieved by increasing public education and outreach efforts within the plan area. Opportunities to promote the creation and maintenance of fish and wildlife habitat should be explored.

The County's existing open space/greenbelt map should be refined to incorporate updated fish and wildlife habitat, critical area, and wooded area data and reflect changes in vacant status as a result of recent development.

Public open space acquisition efforts should focus on those open spaces targeted by the community as high priority acquisition areas. The County's Conservation Future Program should be utilized to help acquire these high priority acquisition areas. Stewardship and management plans that address long-term protection and maintenance should also be developed for these sites. In addition to public acquisition efforts, a variety of other open space acquisition and conservation strategies should be employed to implement open space within the community whenever possible.

**ENVIRONMENT POLICIES**

**GOAL PSM ENV-1** Identify remaining fragments of prairies and oak woodlands located within the plan area.

**PSM ENV-1.1** Conduct an inventory of existing prairies that are greater than one acre in size.

**PSM ENV-1.2** Encourage the retention of slow growing heritage or specimen trees.

**GOAL PSM ENV-2** Increase critical area standards for natural vegetation buffers within riparian and hyporheic zones to protect water quality and the health of the aquatic ecosystem.

**PSM ENV-2.1** Buffer widths shall be calculated and increased, as necessary, based upon the presence of critical fish species, cumulative impacts of stormwater discharge and in-stream flow reductions, pollutant levels, and water temperatures.
The establishment of natural vegetation buffer widths along streams should include existing floodplain meanders, adjacent steep slopes, wetlands, and the area necessary to support the healthy functioning of the hyporheic zone and aquatic species.

Prohibit tree cutting and removal of any native vegetation within the hyporheic zone or riparian buffer zone except as provided through a fish and wildlife habitat buffer variance.

Where disruption of the natural condition within vegetative buffers is permitted, require revegetation that duplicates the historic, indigenous plant community type to restore the buffers’ protective value.

Require a minimum percentage of natural/native vegetation as a component of all new development within the plan area.

Identify and retain a minimum of 15% native vegetation consisting of trees, understory shrubs, and herbaceous groundcover on a portion of each site for development.

If the development has been previously cleared, then a minimum of 15% native vegetation shall be replanted to achieve this requirement.

Retaining areas of mature native vegetation on a site is a higher priority than providing supplemental landscaping.

Encourage that setback areas be retained in native vegetation and enhanced with additional native plant species selected from the historical, indigenous plant community type where native vegetation is sparse or nonexistent.

Require follow-up horticultural care of these supplemented plants that ensures 80-90% success.

Preserve a minimum percentage of existing mature stands of trees on each site proposed for development.

The percentage of trees to be retained shall be based upon the historic, indigenous plant community type for that site.

Retain and re-use existing topsoil/organic duff layer on each development site.

Remove non-native plants at Parkland Prairie Preserve.

Conduct the removal activities in such a manner so as not to damage existing native plants.
GOAL PSM ENV-5  Existing natural drainage courses should be retained and kept free and open to pass storm runoff through any development or use activity instead of encasing the surface water runoff into a piped stormwater conveyance system.

PSM ENV-5.1  However, in cases where a drainage course must be modified, the drainage system entrance and exit points to and from the development must be retained.

PSM ENV-5.2  Natural drainage courses should be protected post-development through an appropriate mechanism, such as developer agreements, maintenance agreements, homeowners’ covenants, or conservation easements.

GOAL PSM ENV-6  Preserve those portions of the plan area (both public and private), such as B Street, 136th, and Tule Lake Road, which serve as storage areas for surface water runoff.

PSM ENV-6.1  Consider purchase of sites that serve as an expansion of the natural drainage/retention system.

PSM ENV-6.2  Utilize floodplain buy-out monies to purchase priority flood storage areas.

GOAL PSM ENV-7  Regulate the filling or modification of surface waters and natural water retention areas.

PSM ENV-7.1  Filling or modifications that decrease or detrimentally affect the existing water levels and water storage capacity within perennial and intermittent streams, ponds, wetlands, or high groundwater areas shall not be permitted.

PSM ENV-7.2  Filling of pothole(s) located on an individual parcel or contiguous with several separate parcels shall address the cumulative impacts of the decrease in natural water retention areas.

PSM ENV-7.2.1  An analysis shall be provided which identifies how this water will be retained elsewhere on site and how affected adjacent property owners shall be notified.

GOAL PSM ENV-7  Regulate the filling or modification of surface waters and natural water retention areas.

PSM ENV-7.3  Work with the Pierce County Emergency Management Department to identify appropriate methods for handling spill response in high-risk areas.

PSM ENV-7.4  Install signage around the perimeter of wellhead protection areas or the most sensitive aquifer recharge areas.

PSM ENV-7.5  Pursue funding opportunities to map spill locations on state routes for areas that have a potential to enter the one-year time of travel zone or storm drainage systems.

GOAL PSM ENV-7  Regulate the filling or modification of surface waters and natural water retention areas.

PSM ENV-7.3  Work with the Pierce County Emergency Management Department to identify appropriate methods for handling spill response in high-risk areas.

PSM ENV-7.4  Install signage around the perimeter of wellhead protection areas or the most sensitive aquifer recharge areas.

PSM ENV-7.5  Pursue funding opportunities to map spill locations on state routes for areas that have a potential to enter the one-year time of travel zone or storm drainage systems.
GOAL PSM ENV-8 Reduces the amount of irrigation that occurs on grass/vegetation that has been installed over soils that have been disturbed and degraded.

PSM ENV-8.1 Apply 6-12 inches of woodchip mulch on sites in forested areas to replace duff, control weeds, and retain moisture.

PSM ENV-8.2 Require the installation of irrigation meters on all new systems and establish limits on the amount of water that can be used for irrigation purposes.

GOAL PSM ENV-9 Require re-use of native topsoil or appropriate soil amendments prior to installation of grass seed, sod, or other vegetation in new developments.

PSM ENV-9.1 All of the site's native topsoil must be retained on site and used for installation of grass, shrubs, and trees.

GOAL PSM ENV-10 Develop cost-sharing programs to help people purchase low-flow fixtures (e.g., faucets and toilets) for their existing homes.

GOAL PSM ENV-11 Discourage extensive, irrigated landscape areas in new developments.

PSM ENV-11.1 Encourage drip irrigation systems and promote water conservation methods for lawn watering (e.g., even-numbered houses would water on even-numbered days, promote conservation pricing measures, re-use of rainwater through collection in cisterns, etc.).

GOAL PSM ENV-12 Condition Forest Practice approvals to eliminate transport of erosion and sedimentation into rivers, streams, and wetlands; provide adequate riparian buffers of natural vegetation; and redirect stockpiling of debris away from water bodies and courses.

GOAL PSM ENV-13 Provide additional protection to improve the quality of surface water bodies in the area (e.g., Spanaway Lake, Clover Creek, and Spanaway Creek).

PSM ENV-13.1 Develop a lake management plan for Spanaway Lake that contains elements addressing water quantity and water quality.

PSM ENV-13.2 Pierce County Parks and Recreation Department should limit the use of and guide the application of chemicals (such as pesticides, herbicides, fertilizers, etc.) within the entire park system, including Spanaway Park, the golf course, and Sprinker Recreation Center, in a manner which does not adversely impact the biological functioning of surface waters.

PSM ENV-13.3 Encourage the replanting of historic, indigenous plant community types within the buffers of any stream, creek, or lake within the plan area.

PSM ENV-13.4 Require a no spray zone for any chemicals within the buffers of any stream, creek, or lake within the plan area or ditches that drain into these waters.

GOAL PSM ENV-14 Identify areas where restoration activities could potentially have a positive effect on water quality and encourage restoration projects within these areas.
PSM ENV-14.1 Identify potential restoration areas through Clover Creek Basin planning and Puyallup River Watershed Council efforts.

PSM ENV-14.2 Work with existing volunteer groups, such as the Pierce Conservation District stream team, to provide restoration actions on identified sites.

GOAL PSM ENV-15 Establish the Chambers-Clover Creek Basin Advisory Committee to serve as a long-term forum for addressing water quality issues within a portion of the plan area.

GOAL PSM ENV-16 Work with the Puyallup River Watershed Council to address water quality issues in that portion of the Midland community located within the Water Resource Inventory Area 10 Puyallup Watershed boundaries.

WETLANDS

GOAL PSM ENV-17 Encourage wetland restoration activities that increase the wetland functions and values.

PSM ENV-17.1 Utilize native species, appropriate to the historic, indigenous plant community type, for vegetation replanting; maintain planting for 3-5 years to ensure success.

PSM ENV-17.2 Require the preparation of habitat management plans prior to authorization of restoration activities.

PSM ENV-17.3 Encourage restoration of wetlands and their buffers that have been degraded as a result of previous development actions within the plan area.

PSM ENV-17.3.1 Pursue grants and other funding sources that could be used to restore important wetland systems that have been degraded.

PSM ENV-17.3.2 Promote programs that involve volunteer efforts to clean up and repair the function and value of damaged wetlands.

GOAL PSM ENV-18 Pursue development and promotion of incentive programs for property owners whose parcels contain wetlands.

PSM ENV-18.1 Conduct public workshops on the County’s Current Use Assessment program, Public Benefit Rating System (tax reduction) to encourage property owners to place wetlands into open space designations.

PSM ENV-18.2 Develop a Transfer of Development Rights and Purchase of Development Rights program for wetland area density transfers.

GOAL PSM ENV-19 Provide greater protection for those wetlands that are inhabited or utilized by federal or state-listed endangered or threatened plant, fish, or animal species.

PSM ENV-19.1 Changes to water quality and quantity that could negatively affect a listed species shall be prohibited.
**Fish and Wildlife Resources**

**GOAL PSM ENV-20** Retain and protect biodiversity management areas and corridors located within and adjacent to the plan area.

**PSM ENV-20.1** Consider implementing urban sensitive resource zones within biodiversity management areas and corridors.

**GOAL PSM ENV-21** Protect priority habitats for resident wildlife such as trees that provide snags, nesting sites, and roosting areas for bird populations and prairies for butterflies.

**PSM ENV-21.1** Establish buffers that are sized according to the best available science.

**PSM ENV-21.1.1** Buffers should be located around important features, such as heron rookeries.

**PSM ENV-21.2** Consider restricting construction activities (e.g., loud noises) that could disturb native birds during nesting periods.

**GOAL PSM ENV-22** Regulate development activities in naturally occurring ponds that are less than 20 acres.

**PSM ENV-22.1** Eliminate the exemption currently granted to ponds.

**GOAL PSM ENV-23** Require that native vegetation buffers of an adequate width be maintained between proposed development and riparian areas/aquatic systems to protect the functional values of such areas and systems.

**PSM ENV-23.1** Allow limited activities within riparian area buffers only when such activities are compatible with the overall functions of the buffer and when such activities do not diminish the functional value of the buffer.

**PSM ENV-23.2** Buffers should include any flood hazard areas, floodplain migration zones, and adjacent wetlands and steep slopes.

**PSM ENV-23.3** Maintain buffers between new roads and utility corridors and riparian areas and aquatic systems, wherever feasible.

**GOAL PSM ENV-24** Mining, dredging, or the removal of gravel, fill, or similar materials from streams or other surface water areas shall be regulated to prevent adverse alterations to flow characteristics, siltation, and the pollution or disruption of spawning bed and rearing pool areas.

**PSM ENV-24.1** Development of ponds for farm uses, fish propagation, residential amenities, and wildlife or waterfowl habitat that are contiguous to wetlands, lakes, ponds, or streams shall require a permit.

**PSM ENV-24.1.1** Such uses may be permitted only if the natural drainage pattern is not adversely altered or water from fish pond does not degrade the stream.

**PSM ENV-24.2** Channelizing, riprapping, diking, or other stream bank stabilization methods which detrimentally increase stream flow or adversely impact the stream’s existing characteristics in any other way shall not be permitted.
PSM ENV-24.3 Eliminate the illegal removal of surface water which decreases the quantity or flow rate of the creek/stream system and regulate the legal removal of surface water.

GOAL PSM ENV-25 Reconstruct infrastructure that acts as a barrier to fish passage as part of any public road or utility projects associated with the blockage.

PSM ENV-25.1 Reduce culverts and encourage bridges, when needed, when constructing or reconstructing water passages under roads.

GOAL PSM ENV-26 Incorporate landscaped greenbelt areas into the open space network.

PSM ENV-26.1 Utilize greenbelts for pathways and integrate this system into the nonmotorized transportation network.

PSM ENV-26.2 Encourage the planting of native vegetation within greenbelt areas, but recognize that other non-native species, such as turf, may be appropriate for the intended use.

PSM ENV-26.3 Integrate man-made structures such as children’s play equipment, climbing rocks, water features, benches, trails, and picnic tables into greenbelt systems.

PSM ENV-26.3.1 Trails shall be made of permeable pavement or materials.

PSM ENV-26.4 Greenbelt areas should integrate or bridge critical areas, such as wetlands and fish and wildlife habitat areas, or designated open space areas when possible.

OPEN SPACE

GOAL PSM ENV-27 Encourage preservation of large tracts of open space corridors through site design mechanisms, such as mandatory clustering requirements, and set aside in separate tracts.

PSM ENV-27.1 Develop best construction methods for activities within or nearby designated open space areas and to protect native growth protection areas.

GOAL PSM ENV-28 Establish design standards and location criteria for open space/greenbelt areas.

PSM ENV-28.1 Utilize open space sites as part of a nonmotorized trail system.

PSM ENV-28.2 Open space corridors should be used to connect wetlands.

PSM ENV-28.3 Structures in designated open space areas should be designed and situated such that they are harmonious with their surroundings, constructed with natural materials, and well screened.

PSM ENV-28.3.1 Utilize materials made of wood and stone for benches, steps, railings, and fences.

PSM ENV-28.4 Environmentally sensitive design standards should be utilized in new developments or redevelopment located within designated open space areas.

PSM ENV-28.4.1 All critical areas shall be set aside as a separate open space tract.
PSM ENV-28.4.2  Depending on the zone classification, the total amount of impervious surfaces on a site should be limited.

PSM ENV-28.4.3  Clustering of lots, dwelling units, or building structures should be considered during the conceptual site development stage.

PSM ENV-28.4.4  Depending on the zone classification, a range of 25% to 50% of each site shall be retained in natural vegetation.

PSM ENV-28.4.4.1  Restoration of vegetated areas to native vegetation, based on the sites soils, hydrology, and topography should occur on each site as necessary to enhance the function of the open space corridor.

PSM ENV-28.4.5  Vehicle parking facilities shall be integrated into open space sites in such a manner that critical areas are not impacted and stormwater impacts are mitigated.

PSM ENV-28.4.6  Other low impact development tools should be considered such as minimizing soil disturbance and erosion, disconnecting constructed drainage courses, utilizing micro-detention facilities on each lot where feasible rather than one facility at the end of a conveyance system, and reducing/sharing parking facilities or using permeable pavement/pavers.

PSM ENV-28.5  Vegetation within native growth protection areas shall be left undisturbed except for carefully planned and maintained pathways.

PSM ENV-28.5.1  Access into native growth protection areas shall be limited to nonmotorized transportation systems.

PSM ENV-28.5.2  Access through native growth protection areas shall be designed to avoid sensitive critical areas such as wetlands and fish and wildlife habitat areas.

PSM ENV-28.5.3  Nonmotorized transportation paths shall follow the natural land contours and be constructed of permeable materials that blend into the natural surroundings.

PSM ENV-28.5.4  Institute an exception for removal of non-native, invasive, or noxious plant species.

PSM ENV-28.6  Encourage developers to utilize green building techniques to soften the urban environment within the open space network.

PSM ENV-28.6.1  Reduce impervious surfaces by providing a layer of plants on hard surfaces to create a new network of vegetation linking roofs, walls, courtyards, streets, and open spaces.

PSM ENV-28.6.2  Design buildings to complement the open space network.

PSM ENV-28.6.3  Utilize courtyards to provide green spaces for work or relaxation, be cultivated as wildlife habitats, or organized as attractive green areas to offer pleasing views from the home or office window.
PSM ENV-28.6.4 Design the outside space during the design of the building structure to integrate vegetation into the design of the building.

PSM ENV-28.6.5 Promote the use of balconies and small terraces in multifamily developments.

PSM ENV-28.6.6 Encourage the use of vegetated rooftops in greenbelt areas or in designated open space areas.

PSM ENV-28.6.7 Integrate public stormwater detention/retention facilities into the open space network.

**IMPLEMENTATION ACTIONS**

The following is a list of actions that need to be completed in order to implement the policies contained within this plan. They are arranged according to the timeframe within which each should be completed: short, medium, or long term. Short term actions should occur immediately or within one year of plan adoption. Mid-term actions should be completed within 2-5 years. Long term actions should be completed within 5-10 years of plan adoption. The party or parties responsible for leading the effort to complete the action item is listed in parenthesis following the action. Actions are assigned to the Parkland Area, Spanaway, and Midland Land Use Advisory Commissions (LUAC), Tacoma-Pierce County Health Department (TPCHD), Public Works & Utilities (PWU), Department of Emergency Management (DEM), Park & Recreation Services, Economic Development (ED), Pierce County Sheriff, or Pierce County Planning and Land Services (PALS).

**ACTIONS TO BE CONSIDERED FOR IMPLEMENTATION IN THE NEXT APPLICABLE COUNTY-WIDE AMENDMENT CYCLE FOR THE INDICATED STANDARDS/REGULATIONS OR PLANS**

1. Amend the Pierce County Critical Area Regulations and include the following revisions:
   - Adopt oak woodland and prairie maps into the Critical Areas Atlas.
   - Increase the buffer and vegetation removal standards for wetlands, riparian, and hyporheic zones.
   - Establish a streamlined permit process for vegetation restoration projects.
   - Provide additional standards for retention of existing vegetation that is considered a habitat of local importance (i.e., oak woodlands and prairies).
   - Extend stream buffer requirements to include any adjacent meander course of flood hazard areas, wetlands, and steep slopes.
   - Require revegetation with native species appropriate to the soil, hydrology, and historic, native plant community type as mitigation for buffers that have been disturbed or where existing vegetation has been removed. The replanting location should be approved on a landscaping plan, site plan, or clearing and grading plan.
   - Review the penalties and enforcement language to determine if the provisions are adequate to deter illegal activities.
   - Require property disclosure requirements to notify prospective purchasers that a wetland or fish and wildlife habitat area exists on the parcel.
• Include biodiversity management areas and corridors as a habitat of local importance.
• Minimize the amount of clearing and grading that is allowed within designated fish and wildlife habitat areas.
• Restrict or limit the number and type of fences that are allowed in wildlife movement corridors.
• Require all designated vegetation retention areas be reserved as open space and identified as native growth protection areas on the face of the plat, site plan, construction plans, and as a deed restriction on the property. The allowable uses within these areas should be clearly set forth.
• Establish and record native growth protection area easements for buffers and vegetation retention areas as part of the development approval process.
• Require the location of all designated riparian area buffers or vegetation retention areas be clearly and permanently marked as a native growth protection area on any project site prior to initiation of site work.
• Establish a process for reviewing requests for riparian buffer width reductions.
• Develop regulations that address the negative impacts associated with development and resource management activities that can potentially damage stream and river systems.
• Establish regulations prohibiting spraying of chemicals within the buffers of any wetlands, creeks, streams, or lakes.
• Provide criteria for road development in known wildlife movement corridors.
• Require the removal of illegal wetland fill and restoration to original functions and values.
• Review the existing wetland buffer standards and amend as necessary to be consistent with the standards set forth in best available science. Consider wetland banking programs.
• Establish the requirement for developers/builders to provide homeowner education on open space/critical area maintenance.
• Develop regulatory standards for ponds and eliminate current exemptions.
• Add standards for habitat management plans. (PALS)

2. Complete an update to the Pierce County Shoreline Master Program. Actions included in the SMP specific to the Parkland-Spanaway-Midland Communities Plan area are to:
   • Correct errors to the Pierce County Shorelines Atlas.
   • Create new Shoreline Environment designations in several locations.
   • Establish design standards to ensure habitat and vegetation preservation, protect water quality, and protect natural processes.
   • Develop more restrictive standards for the installation of new bulkheads and hard armoring techniques. (PALS)

3. Adopt a native tree/vegetation preservation and restoration ordinance that contains requirements for a minimum percentage of the trees/vegetation to be retained on a site or a minimum amount of trees be replanted. (PALS)
4. Amend the Pierce County Site Development and Stormwater Management Regulations and include the following revisions:

- Adopt low impact development (LID) guidelines and amend existing codes to allow LID techniques to be utilized.
- Revise the flood hazard regulations to limit the use of hard armoring techniques, restrict the installation of septic systems within flood hazard areas, and require failing septic systems within flood hazard areas to connect to the sewer system if a sewer line is available at the site.
- Preserve natural drainage courses within a site.
- Require an analysis of the water holding capacity of potholes, and if proposed to be filled, how this water will be retained elsewhere on site.
- Reduce culverts and encourage bridges when needed.
- Retain and re-use existing topsoil/organic duff layer on each development site.

(PWU)

**SHORT TERM ACTIONS**

1. Provide additional County staffing resources to conduct enforcement of the County’s wetland and fish and wildlife regulations. (PALS)
2. Commence expiration of applications that have been inactive for over a one-year time period. (PALS)
3. Amend the County Parks Department protocols on applying pesticides, herbicides, and fertilizers within Spanaway Park, the golf course, and Sprinker Recreation Center to implement procedures which do not adversely impact the biological functioning of Spanaway Lake and Spanaway Creek. (Parks)
4. Amend the County Public Works and Utilities protocols to require the reconstruction of infrastructure that acts as a barrier to fish or any wildlife passage when any public road or utility project would affect or be affected by the blockage. (PWU)
5. Amend the County Comprehensive Plan Open Space/Greenbelt Map to:
   - Adopt the changes set forth in the proposed open space/greenbelt refinements map.
   - Amend the open space policies to clarify that the proceeds from any sale of a publicly owned open space site be used to purchase an equivalent or greater amount of land or land which provides an equivalent or greater ecological function and value. (PALS, Parks)
6. Amend Section 2.110.130 PCC to clarify that the proceeds from any sale of a publicly owned open space site be used to purchase an equivalent or greater amount of land or land which provides an equivalent or greater ecological function and value. (PALS, Parks)
7. Develop a schedule for developing stewardship and management plans for publicly owned open space properties. (Parks)
8. Work with the land trusts, Clover Creek Council, Tahoma Audubon, and Pierce County WSU Cooperative Extension Office to conduct workshops within the plan area and Clover Creek watershed sub-basin on the Current Use Assessment Public Benefit Rating System. (PALS, Parks)

9. Enter into negotiations with a local land trust to initiate a transfer of the Parkland Prairie and Wildlife Habitat open space site. (Parks, Land Trusts)

10. Conduct a meeting or series of meetings with the local land trusts to discuss the adopted Open Space/Greenbelt Map and open space acquisition priorities and opportunities. (PALS, Parks, Land Trusts)

11. Conduct an analysis to determine the feasibility of placing an open space tax initiative (RCW 82.46.070) on the ballot. (Parks)

12. Work with local land trusts and environmental organizations to sponsor properties within the plan area for acquisition through the Conservation Futures Program. (PALS, Parks)

13. Utilize the open space network map when delineating proposed major and minor trail systems. (PALS, Parks)

14. Adopt design standards for construction that is located within designated open space/greenbelt areas. Integrate green building techniques into these design standards. (PALS)

**Mid-Term Actions**

1. Amend the County Comprehensive Plan Open Space/Greenbelt Map to update with any new fish and wildlife habitat information on prairies and oak woodlands. (PALS)

2. Implement water conservation measures on a countywide basis. (PALS)

3. Develop a set of protocols for handling spill response in high risk aquifer recharge areas. (TPCHD, DEM, WDOT)

4. Amend the Pierce County Zoning Code to:
   - Reduce the allowable amount of effective impervious surface created in commercial/multifamily developments by parking stalls, lots, and internal roads.
   - Remove the requirement to provide an irrigation system for commercial development and establish minimum requirements for native plant species appropriate to soil, hydrology, and historic, indigenous plant community types. (PALS)
   - Reduce the levels of density and intensity of allowable uses within those portions of the natural environment that contain critical areas and open space corridors by implementation of Urban Sensitive Resource Zones. Adopt design criteria (such as mandatory clustering and building construction) and site development standards (such as low impact development, maximum impervious surface coverage, minimum vegetation retention, and open space dedication) within these zones.
   - Require conditional use permits for any proposed expansion of a nonconforming use within a designated fish and wildlife area.
- Define and increase vegetation requirements to reduce the allowable amount of impervious surface area.
- Require a conservation easement be recorded on any open space dedication that was provided in exchange for a density bonus. (PALS)

5. Amend the County's subdivision and platting regulations to establish a requirement for developers/builders to provide homeowner educational material on open space and critical area tract maintenance. (PALS)

6. Conduct a detailed inventory and delineation of wetland complexes within the plan area. (PALS)

7. Complete basin plans which will include the following:
   - Potential flood hazard/prone areas.
   - Establish water quality baselines and monitoring data for the streams, lakes, and wetlands within the plan area and also those systems that serve as stormwater receiving areas outside the plan area.
   - Identify sites for potential acquisition and where restoration activities would have the most benefit. (PWU)

8. Coordinate ditch maintenance activities, streamside restoration projects, and the additional release of surface water runoff into existing ditches with the applicable drainage districts. (PWU, PALS, Drainage District 14 and 19)

9. Develop partnerships with the Washington State University Pierce County Cooperative Extension Office, the Pierce Conservation District, and other environmental groups such as the Tahoma Audubon to conduct additional workshops and training on preserving wetlands, restoring riparian areas, conducting fish passage surveys, instituting better farm management practices, placing properties in open space, and increasing water quality. (PALS, PWU)

10. Establish the Chambers-Clover Creek Basin Advisory Committee. (PWU)

11. Establish a monitoring program to determine compliance with vegetation requirements. Penalties for non-compliance should include a fine. (PALS, PWU)

12. Conduct an inventory of publicly owned properties located within the adopted open space network to determine suitability for long-term stewardship and management as permanent open space and:
   - Place conservation easements on those parcels designated for permanent open space.
   - Prepare long-term management plans for any parcels identified for permanent open space.
   - Initiate transfer of these properties to a local land trust for long-term management and stewardship. (PALS, Parks, Land Trusts)

13. Update the Bresemann Forest Management Plan with an emphasis placed on the forest's ecological function and value. (Parks)

14. Amend the Subdivision and Platting Regulations to require homeowners’ maintenance agreements for open space areas. These amendments should include a requirement for
developers/builders to prepare and distribute informational brochures regarding the maintenance of designated open space areas. (PALS)

15. Facilitate a meeting with the WSU Cooperative Extension Office and Pierce Conservation District to identify specific open space areas for concentrated public education and outreach efforts. (PALS, Parks)

16. Provide educational materials on green building techniques at the Pierce County PALS Development Center. (Parks, WSU Cooperative Extension Office)

**LONG TERM ACTIONS**

1. Adopt detailed inventories of flood hazard areas within Pierce County to augment the FEMA Flood Insurance Rate Maps and Flood Boundary Hazard Maps. (PWU)

2. Institute changes to the County’s stormwater management practices for reducing the allowable amount of effective impervious surface, disconnecting stormwater conveyance systems from direct discharge into water courses and bodies, and retrofitting best management practices to meet current water quality standards. (PWU)

3. Develop a lake management plan for Spanaway Lake. (PWU)

4. Develop a Transfer of Development Rights and Purchase of Development Rights Program. (PALS)

5. Implement an annual on-site septic performance test program to determine whether these systems are functioning properly. (TPCHD)

6. Develop and implement a long-term water quality monitoring program. (TPCHD, PWU, PALS, DOE, WSU-Cooperative Ext.)

7. Inventory and map existing wildlife within the plan area. (PALS, WDFW, UW)

8. Continue County funding for the WSU Cooperative Extension Office - Water Quality Program, Master Gardeners Program, Pierce Conservation District - Stream Team Program, and Farm Management Program. (County Council)

9. Expand the open space program to conduct more detailed fish, wildlife, and plant inventories within the designated open space network. Work with State agencies and universities to help conduct inventories. (PALS, Parks)

10. Remove non-native plants at the Parkland Prairie Preserve.

Chapter 5: Economic Element

Introduction

Economic development refers to actions of the public and private sectors that encourage the creation or continued existence of a stable employment and tax base. A strong local employment base provides an opportunity for Parkland, Spanaway, and Midland residents to earn a living in their communities, which in turn supports local businesses that generate additional tax revenues that support community needs. Having a strong local employment base also reduces the pressure on our regional transportation system.

Economic actions can either be broad or targeted toward specific types of businesses, specific wage levels, or active recruitment of businesses that offer goods and services missing in the community. Targeting areas for commercial and industrial development, redevelopment, and revitalization are economic development strategies that can be employed as a means of generating economic growth in specific areas of Parkland, Spanaway, and Midland.

Communities plan objectives, principles, and standards use broader County-Wide Planning Policies and Pierce County Comprehensive Plan as the framework for discussing economic issues. The Parkland-Spanaway-Midland Communities Plan is designed to target specific areas and actions to generate economic vitality and growth.

Description of Current Conditions

The work force in the Parkland-Spanaway-Midland area is spread among several categories of occupations, with at least 15% of the work force employed in each of five categories. The largest percentage (31%) is employed in technical, sales, and administrative support occupations. The 1990 census indicates that the majority of the area work force works outside the plan area with approximately 59% travelling 20 minutes or more to their employment site. The 1990 census also shows that approximately 81% of those residents 18 years or older have graduated from high school and 22% percent have continued their education and earned an Associate, Bachelor, or Graduate degree.

Source: U.S. Census, 1990
Employment located in the Parkland-Spanaway-Midland area is heavily concentrated in retail trade and service sectors. Nearly 61 percent of all employment is found in retail trade and services. Unfortunately these two sectors tend to have the lowest average annual wage compared to other employment sectors. Conversely, wholesale trade and manufacturing have the lowest percent employees and highest average annual wage in the plan area.

Businesses in the plan area, on average, are small-scale and employ a low number of individuals. The average number of employees per firm is 7.15, considerably less than the State average of 10.3 employees. This may be attributed to the manufacturing and service sectors. Although manufacturing represents the sector with the highest employees per firm in the plan area, it is roughly half of the State average at 15.6 employees. Similarly, the service sector in the plan area is slightly higher than half the State average at 4.3 employees per firm. (See Table I-10)

</table>

*Private education employment is encompassed within the Services industry above. Public education is a component of local government which is not provided in the table.

**DESCRIPTION OF DESIRED CONDITIONS**

**COMMERCIAL/INDUSTRIAL GROWTH**

The Parkland-Spanaway-Midland planning area should provide an adequate amount of land dedicated for commercial and industrial uses within the overall parameters of the Pierce County Comprehensive Plan and the identified needs and desires of the local communities. Commercial and industrial uses provide jobs for the local population, which in turn support a healthy tax base. Designation of an adequate supply of commercial and industrial land to meet the needs of the current population and projected population growth within the communities plan area will help assure that space will be available for future economic growth. Commercial and industrial uses that are developed in a manner that is functional and aesthetically pleasing serve to attract new investment, redevelopment, and revitalization of existing businesses as well as enticing customers to shop and work in the area. The level of new development should be monitored to determine if the growth objectives are being met.

**COMMERCIAL REVITALIZATION**

Vital, attractive, commercial areas create a positive image for the surrounding residential neighborhood and stimulate investment, which in turn provide economic growth for the area and its residents and an increased tax base for local government. This plan should provide guidance on revitalizing existing commercial neighborhoods within the communities plan area which may be experiencing a decline or high turnover of businesses. Commercial revitalization is best accomplished when the local government (public) and merchants or merchants associations (private) work together as partners to induce the overall improvement of a defined commercial center or corridor, referred to as target area.

When identifying commercial neighborhoods as candidates for revitalization efforts and in ranking neighborhoods as to priority for receiving revitalization efforts, the following criteria should be utilized:

1. Areas targeted for revitalization should demonstrate economic viability by providing information that a core of financially stable businesses exists;
2. Areas targeted for revitalization should be limited to a well-defined area;
3. Areas targeted for revitalization should be composed of a density and quality of building stock that lend themselves to a cohesive sense of place; and
4. Areas targeted for revitalization should be mostly developed, devoid of excessive vacant parcels.
Operating a successful small business is a challenging endeavor. Local businesses struggle with a variety of issues such as marketing and promoting strategies, managing employees, capital for operations, upgrades, and expansions, and long-term business goals. This plan is intended to illustrate methods or strategies for helping local businesses within the communities plan area stay in business while still enhancing community values.

**Public/Private Partnerships**

The community desire of a balanced economic environment often requires commitment by both the public and private sectors. Public involvement can include providing the necessary infrastructure, facilities, services, and financial incentives that promote commercial and industrial development. Private investment can construct and maintain existing commercial and industrial uses in a way that enhances the area's viability. The community also desires to highlight creative methods of public and private interaction that serve to increase the potential for commercial and industrial development within the plan area.

**Employment Opportunities**

The economic prosperity of the local citizenry is an important goal of both the Growth Management Act and the local planning documents which are adopted to address economic development. This element should foster strategies which address the need to assure that unemployed, underemployed, and disadvantaged persons within the communities plan area have access to the local job market.

**Education Resources**

The community recognizes that economic prosperity of the local citizenry is directly linked to successful educational programs. This element should foster strategies which address the need to assure that school districts continue to work with the local citizenry to develop goals and strategies that result in higher test scores, higher graduation rates, work study programs, and higher placement into institutions of higher education.

**Economic Development Policies**

**Goals**

The following statements comprise the goal for economic development in the Parkland-Spanaway-Midland Communities Plan:

- Encourage economic investments in the communities which will result in a variety of family wage job opportunities;
• Encourage development of a well balanced economic base for the communities;
• Economic activities are encouraged within the communities, but not to the detriment of either the natural environment or residential neighborhoods;
• The type and scale of economic development proposed for specific locations in the communities shall be compatible with nearby residential neighborhoods and other land uses;
• New economic development in and redevelopment of existing business areas shall focus on meeting present and future needs of the residents of individual communities and the region as a whole; and
• Economic activities with similar infrastructure needs, operational needs, and customer bases shall be located in proximity to one another and permitted only in areas where needed public facilities and services can be efficiently provided prior to or concurrent with commencement of the economic activity.

COMMERCIAL/INDUSTRIAL GROWTH

GOAL PSM EC-1 Designate an adequate amount of land to support commercial and industrial needs within the Parkland-Spanaway-Midland Communities Plan area over the next 20 years.

PSM EC-1.1 Develop an inventory of locations within the communities plan area where commercial and industrial development opportunities are encouraged to occur in the future.

PSM EC-1.2 Pierce County shall work with other public agencies and private interests to identify and promote sites which can be suitably developed for a variety of local employment opportunities.

PSM EC-1.3 Pierce County shall work with property owners to determine the development potential of sites having commercial and industrial employment possibilities.

GOAL PSM EC-2 Utilize existing commercial and industrial areas within the communities plan area to the maximum development potential.

PSM EC-2.1 Allow new residential development within designated commercial areas where it supports the primary commercial functions and can maximize the economic development potential within these areas.

PSM EC-2.2 Prohibit new residential development within designated industrial areas to maximize the economic development potential within these areas.

PSM EC-2.3 Ensure that compatible economic activities are located in proximity to each other and their functioning is not adversely impacted by other uses.

PSM EC-2.4 Encourage redevelopment of underutilized commercial and industrial areas within the communities plan area.
GOAL PSM EC-3  Target new areas for commercial and industrial growth which are or are planned to be serviced with the infrastructure for development.

GOAL PSM EC-4  Designate additional land for industrial uses and incubator space for start-up industrial businesses.

PSM EC-4.1  Encourage the development of industrial areas which provide incubator space for small-scale, start-up industrial and high tech businesses.

PSM EC-4.2  Efforts shall be made to focus industrial, office park, and research development into the following areas:

- PSM EC-4.2.1 South Portland Avenue Community Employment Center (CE);
- PSM EC-4.2.2 A Street/SR 512 CE;
- PSM EC-4.2.3 North Steele Street CE;
- PSM EC-4.2.4 South Steele Street CE;
- PSM EC-4.2.5 South Pacific Avenue CE;
- PSM EC-4.2.6 Mountain Highway CE; and
- PSM EC-4.2.7 Selected portions of the Mixed Use Districts and Community Centers.

GOAL PSM EC-5  Work with authorities at Joint Base Lewis-McChord to identify and promote development of commercial businesses.

PSM EC-5.1  Work with military authorities to identify the commercial retail and service needs and wants of single and married personnel who live both on base and off, and encourage the development of such uses where compatible with residential and commercial neighborhoods and community values.

PSM EC-5.2  Work with military authorities to identify employment needs of military families and work to encourage location of businesses that can accommodate employment needs.

PSM EC-5.3  Work with military authorities to identify the types of military supplies that could be obtained locally and encourage the development of such businesses.

PSM EC-5.4  Work with and encourage military authorities to allow regular access through the Joint Base Lewis-McChord east gates for persons working on base to more easily obtain goods and services in Parkland and Spanaway.

COMMERCIAL REVITALIZATION

GOAL PSM EC-6  Develop strategies to enhance commercial centers and corridors within the communities plan area.

PSM EC-6.1  The following commercial centers and districts meet the criteria for commercial revitalization efforts, and efforts shall be focused into the neighborhoods according to the following community rankings.
PSM EC-6.1.1 Revitalization efforts shall not be focused into second or subsequent priority neighborhoods prior to the top priority of each community having received appropriate revitalization attention.

Midland:
- 99th Street Neighborhood Center (NC); and
- 72nd Street Mixed Use District (MUD).

Parkland:
- Garfield Street Activity Center (AC);
- South Parkland/Pacific Avenue MUD;
- North Parkland/Pacific Avenue MUD;
- 112th Street MUD (west of D Street); and
- Park Avenue/112th Street/C Street NC.

Spanaway:
- Central Spanaway/Pacific Avenue MUD;
- Spanaway Park AC; and
- 176th Street Community Center.

PSM EC-6.2 The following commercial centers and districts do not meet the criteria for commercial revitalization efforts, but efforts shall be focused toward developing these neighborhoods for commercial purposes:

- North Portland Avenue Mixed Use District (MUD);
- 112th Street MUD (east of D Street);
- Central Parkland/Pacific Avenue MUD;
- 8th Avenue MUD; and
- 8th Avenue Community Center.

PSM EC-6.3 Pierce County, in cooperation with the business organizations and associations, shall work with business groups to institute business improvement programs within selected commercial areas targeted for commercial revitalization and in areas requiring substantial initial development and in new and existing industrial areas.

PSM EC-6.4 Pierce County shall work with the local business community within selected commercial target areas to develop the framework for a business improvement program, including structuring local marketing efforts, physical improvements programs, parking and building improvements, special management organizations, or other programs necessary for effective revitalization of the area.

PSM EC-6.4.1 Business improvement programs shall focus on improving the tenant base through retention and recruitment efforts, facade renovations which utilize common design elements, installation of supporting public improvements, active enforcement of local zoning, weed and refuse control ordinances, and collective promotion and maintenance of the commercial target area.
Funding for a business improvement program shall be provided through public financial incentives including revolving loan funds (RLF), Small Business Administration (SBA) loans, microenterprise loans, efforts of private financial institutions, and a commitment from local businesses to complete identified site and facade renovations.

Work with the private sector to create a Pacific Avenue redevelopment strategy that can mobilize local and regional resources to build an enhanced tax base.

The County, Chamber of Commerce, and business and community leaders should form a task force to make recommendations on the formation of a Parkland-Spanaway-Midland business district along SR 7 from SR 512 to 176th.

Pierce County shall work with the community to reprioritize planned public projects within the commercial revitalization target areas.

Such projects will contribute to a revitalization effort by upgrading the appearance, setting it apart from its surroundings, and enhancing the attractiveness of the business environment.

Projects which enhance a commercial target area’s appearance may include: installation or repair of common public spaces such as sidewalks, plazas, and bus stops; installation of planting areas, landscaping, and specialized street furniture or lighting; and design and installation of quality graphics, directional signs, planters and plantings, or banners that bring color to the street.

Seek the support of business organizations and associations to provide marketing and promotion assistance to businesses within the communities plan areas targeted for commercial revitalization.

Request that the Tacoma-Pierce County Chamber of Commerce prepare a market assessment to help determine the viability of potential target areas.

Market assessments shall provide an update of the commercial market through analyzing the area’s past and recent performance in the various sectors; documenting existing conditions, emerging trends, opportunities, and constraints (i.e., the depth of the market); and identifying a portfolio of key properties and development opportunities.

The market assessment shall help rank and prioritize the potential target areas for the receipt of public improvements.

Utilize existing or form new local business associations to help develop common promotion (advertising, joint merchandising, and special events) and future business development (leasing, business recruitment, and market research) within selected commercial target areas.
**GOAL PSM EC-9** Pierce County shall participate in special public/private ventures within the communities plan area when such ventures provide public benefits, support commercial or industrial development or commercial revitalization policies, and are appropriate to the long-range goals of the County.

**PSM EC-9.1** Pierce County shall act in partnership with the private sector to fund infrastructure as part of the communities plan to encourage redevelopment to convert outdated and underutilized land and buildings to high-valued or appropriate land uses.

**PSM EC-9.2** Pierce County shall budget for public infrastructure to encourage infill, land assembly, redevelopment, and land conversion for commercial and industrial development, with the priority toward those areas with substantial private development.

**GOAL PSM EC-10** Centers and districts in each community shall be targeted for a planned action according to the following priorities:

**Midland:**
- 99th Street Neighborhood Center (NC);
- South Portland Avenue Community Employment Center (CE);
- A Street/SR 512 CE;
- North Portland Avenue Mixed Use District (MUD); and
- 72nd Street MUD.

**Parkland:**
- Garfield Street Activity Center (AC);
- South Steele Street CE;
- North Steele Street CE;
- South Parkland/Pacific Avenue MUD;
- North Parkland/Pacific Avenue MUD;
- 112th Street MUD;
- Park Avenue/112th Street/C Street NC; and
- Central Parkland/Pacific Avenue MUD.

**Spanaway:**
- Central Spanaway/Pacific Avenue MUD;
- Spanaway Park AC;
- Mountain Highway CEC/8th Avenue MUD/8th Avenue Community Center (CC); and
- 176th Street CC.
EMPLOYMENT OPPORTUNITIES

GOAL PSM EC-11  Encourage Washington State to develop a Washington State Economic Security Department co-location site within the communities plan area.

IMPLEMENTING ACTIONS

The following is a list of actions that need to be completed in order to implement the policies contained within this plan. They are arranged according to the timeframe within which each should be completed: short, medium, or long term. Short term actions should occur immediately or within one year of plan adoption. Mid-term actions should be completed within 2-5 years. Long term actions should be completed within 5-10 years of plan adoption. The party or parties responsible for leading the effort to complete the action item is listed in parenthesis following the action. Actions are assigned to the Parkland Area, Spanaway, and Midland Land Use Advisory Commissions (LUAC), Tacoma-Pierce County Health Department (TPCHD), Public Works & Utilities (PWU), Park & Recreation Services, Economic Development (ED), Pierce County Sheriff, or Pierce County Planning and Land Services (PALS).

SHORT TERM ACTIONS

1. Amend the Pierce County Development Regulations-Zoning to:
   - Prohibit new residential development within designated industrial areas in order to maximize the economic development potential within these areas.
   - Revise the Landscaping and Buffering Chapter, where needed, to maintain adequate buffers between commercial/industrial areas and residential areas and environmentally sensitive areas. These revisions should focus on preserving existing vegetation, when feasible. (PALS)

2. Amend Title 18J, Development Regulations-Design Standards to adopt design standards and guidelines for commercial and industrial areas within the plan area. At a minimum, the design standards should:
   - Mitigate any negative impacts between commercial/industrial areas and residential neighborhoods and sensitive features in the natural environment.
   - Address the transition between commercial/industrial uses and residential uses.
   - Minimize any negative impacts between commercial/industrial areas and residential neighborhoods and sensitive features in the natural environment.
   - Provide acceptable visual and physical transition in bulk, setbacks, landscaping, and architectural style between the existing commercial/industrial uses and any adjoining residential uses. (PALS)

3. Work with Pierce Transit to review bus service between and through residential neighborhoods, commercial centers and districts, and community employment centers within the plan boundaries. (PALS, LUAC)
Mid-Term Actions

1. Amend the Pierce County Development Regulations-Environmental to adopt a regulatory framework to support planned actions within Pierce County. (PALS)
2. Amend Title 4A of the Pierce County Code (Impact Fees) to create a mechanism for predetermined impact fees to support community-wide transportation related improvements. (PALS, PWU)
3. Develop planned action ordinances for pre-selected commercial/industrial areas within the communities plan boundaries. (PALS, ED)
4. Amend the Pierce County Six-Year Capital Facilities Plan and supporting plans as necessary to:
   - Identify and prioritize infrastructure, services, and facilities necessary to support commercial and industrial growth within selected centers and corridors.
   - Include identified improvements necessary to support a planned action.
   - Construct public works projects that improve stormwater drainage within the communities plan area. (PALS, B&F)
5. Develop an inventory of locations within the communities plan area where commercial and industrial uses are now occurring and where redevelopment opportunities could occur in the future such as the potential to consolidate smaller parcels of commercial/industrial land to facilitate their use in a more efficient manner. (PALS, LUAC)
6. Track annual development of commercial and industrial uses within the communities plan area to determine if the actual level of development provides an adequate amount of land for economic growth within the communities plan area. (ED)
7. Prepare a report related to annual economic indicators every 5 years or in conjunction with a communities plan update, whichever comes first. (ED)
8. Work with the owners of the Harold LeMay Car Collection, the Tacoma-Pierce County Chamber of Commerce, Tacoma-Pierce County Convention and Visitors Bureau and others, to assist in the siting, funding, development and marketing of a facility for the display of part, or all, of the Harold LeMay Car Collection in the Parkland-Spanaway-Midland community, preferably on the site of the Marymount Academy in Spanaway.

Long Term Actions

1. Work with the local business community to:
   - Target commercial areas for revitalization efforts.
   - Identify financial incentives for facade or building improvements related to commercial revitalization efforts.
   - Help develop common promotion (advertising, joint merchandising, and special events) and business development (leasing, business recruitment, and market research) within selected commercial target areas.
• Provide Small Business Administration (SBA) information to local businesses regarding the availability of funding for improvements, expansions, relocations, etc.
• Educate employers on rideshare and public transportation subsidies for employees who utilize public transportation.
• Develop the framework for a business improvement program including but not limited to structuring local marketing efforts, physical improvements programs, parking and building improvements, special management organizations, or other programs necessary for effective revitalization of the area.
• Develop an inventory of available business assistance programs and publish in a form useful to businesses of all sizes. (LUAC, PALS)

2. Work with the Tacoma-Pierce County Chamber of Commerce to provide services within the plan area such as business promotion (common advertising, joint merchandising, and special events), business development (leasing information, business recruitment, market research), and labor recruitment and training. (LUAC)

3. Conduct a study to determine the amount of land needed to provide an adequate amount of commercial and industrial uses to meet the employment needs of the current population and projected population growth. (LUAC)

4. Maintain current commercial and industrial site survey information such as available and projected public services, surrounding land uses, transportation capabilities, critical areas, and other relevant economic information. (ED)

5. Provide education to the local citizenry on job training services and employment opportunities which are available within the communities plan area.

6. Promote job search and skills training opportunities provided by local community and technical colleges. (ED)

7. Actively recruit the following commercial and industrial uses to locate within the communities plan area:

• Recreational/youth-oriented commercial activities such as movie theaters, bowling alleys, etc. in the commercial centers;
• Health care industry facilities in commercial centers;
• Lodging opportunities in the Activity and Community Centers, particularly in the vicinity of the Pacific Lutheran University campus;
• Office space for professional services, computer industries, or corporate headquarters in commercial centers and selected portions of the Community Employment Centers;
• Pedestrian-oriented retail uses such as arts and crafts, specialized gift shops, delis, restaurants, boutiques, etc. in commercial centers;
• Destination attractions and supporting uses, including but not limited to the Harold LeMay Car Collection or portion thereof, which could draw Mount Rainier bound tourists and cause them to linger in the communities;
• Businesses which could benefit from proximity to the staff and students of Pacific Lutheran University;
• Commercial businesses needed by military personnel or businesses which can be supportive of military operations. (ED)

8. Work with the Washington State Department of Employment Securities to develop a Employment Securities Department co-location site within the communities plan area.

COMMERCIAL AND INDUSTRIAL REDEVELOPMENT STRATEGY

This Section, which will provide detailed implementation strategies for enhancing the economic viability of the Parkland-Spanaway-Midland Community Plan area, is under development. This Section will be amended into the Economic Element of the PSM Plan as a Plan Amendment in the 2003 Plan Amendment cycle.
Chapter 6: Facilities and Services Element

INTRODUCTION

The Facilities and Services Element articulates needs for facilities and services to implement the visions and goals of the communities plan. Facilities and services are collectively considered infrastructure and may include public or privately funded projects. Policy statements regarding infrastructure provide direction to investors and decision-makers about investments desired and needed by the community. The element also prioritizes the projects and suggests potential funding sources to complete the projects.

DESCRIPTION OF CURRENT CONDITIONS

SEWER AND WASTEWATER TREATMENT

In the mid-1970s, Utility Local Improvement District (ULID) 73-1 began constructing sewer collection facilities to connect a large part of Parkland and Spanaway to sanitary sewer. Although on-site sewage disposal systems were primarily concentrated in rural areas of the County where lots are large enough for drainfields, on-site sewage systems were also used in urban and suburban areas such as Parkland that were beyond the service area of the Tacoma Sewer Utility. The Lakewood/Parkland area was the largest urban area in the country served by on-site sewage systems until 1984 when the Chambers Creek Regional Wastewater Treatment Plant (WWTP) opened and began sanitary sewer service to the community. (See Map I-9: Sewer Service/Stormwater Facilities)

The life span of an on-site sewage system is typically 20 to 30 years, depending on the maintenance of the system and the type of soils. Since most of the on-site sewage disposal systems in the Parkland-Spanaway-Midland communities were built that long ago, many of these systems are reaching maturity. Despite the older systems, the failure rate is not higher than the one-half percent countywide average. Once an on-site sewage system is reported for repairs, the County can track the operation and maintenance of on-site systems. The main goal of the County is to have on-site sewage disposal systems maintained and monitored on a regular basis.

All of the planning area falls within the Chambers Creek Regional WWTP service area. The Chambers Creek treatment plant is currently rated at 19 million gallons per day (MGD) at average dry weather flow and in 2000 operated at 14.41 MGD. Equipment at the plant is periodically upgraded or fine-tuned to keep pace with performance requirements established by the State of Washington through the NPDES (National Pollution Discharge Elimination System) permit. Each year’s capital improvement program includes equipment upgrades. Treatment plant operators are constantly refining processes to achieve the maximum reduction of suspended solids, biological oxygen demand, chlorine, and nutrients in treated wastewater being discharged to South Puget Sound.
Level of service for sanitary sewers is established in the Capital Facilities Element of the Comprehensive Plan. LOS was set at 220 gallons per residential equivalent (RE). (i.e., In planning for collection system and treatment capacity, one single-family residence is expected to contribute 220 gallons of wastewater per day.) A multifamily residence is 0.83 RE. Commercial and industrial land uses are expected to contribute 1,000 gallons of wastewater per day per acre.

There are several sewerage plans that apply to the community planning area. The most significant are the Comprehensive Sewerage Plan for Pierce County, Washington, 1969; the Chambers Creek Basin Water Quality Management Plan, 1974; the Pierce County Sewerage General Plan Update, Chambers Creek Clover Creek Basin Sewerage System, February 1986; and the General Sewerage Plan Update, November 1991.

Development regulations pertaining to sanitary sewers are provided by the Pierce County Wastewater Utility in the Pierce County Code. One of the major issues for the plan area is inflow of stormwater into the sewage systems during storm events. People lift sewer manhole lids to drain standing water. Huge quantities of extraneous water deluge the wastewater conveyance system and treatment plant potentially overloading pump stations and pipelines and throwing off the biological treatment process. For this reason the federal Clean Water Act prohibits combined stormwater and sewage systems.

DOMESTIC WATER SYSTEMS

Overview of Water Rights and Water Allocation

The Department of Ecology (DOE) issues water rights in Washington State. A water right is a legal authorization to use a certain amount of public water for specific beneficial purposes. State law requires every user of streams, lakes, springs, and other surface waters to obtain a water right permit. The use of groundwater requires a water right unless they use 5,000 gallons or fewer each day or are irrigating less than 1/2 acre. A water right will be issued only if the proposed use of water meets the following requirements:

- Water will be put to beneficial use;
- No impairment to existing or senior water rights occurs;
- Water is available for appropriation; and
- The requested water right will not be detrimental to the public’s welfare.

Domestic water within the plan area is provided by a combination of individual on-site wells, small Group B Systems and 35 Group A Water Systems. The plan area is almost entirely serviced by Class A Water Systems, with the exception of three small areas (see Map I-10: Water Systems). The major water purveyors providing domestic water service within the plan area include Parkland Light and Water, Spanaway Water Company, Summit Water Company, Tacoma Water Division, and Rainier View Water Company-Southwood/Sound System. As potable water is a necessary component of development, a more detailed overview of each major water purveyor serving the plan area is warranted, as well as the issues that impact the ability of these purveyors to supply domestic water for new growth.
**Parkland Light and Water Company**

Parkland Light & Water Company (PL&W Co) water sources appear adequate for the 20-year planning period, 2000-2020. The water sources provide both yearly and peak hour amounts in sufficient quantities to provide for the growth projections. With storage capability for equalizing the source demands on peak days, no additional sources are required. However, PL&W Co’s reliance on long term future groundwater sources is dependent upon the issuance of additional water rights from Ecology. DOE is presently not issuing new water rights in the Clover/Chambers Creek basin. As the groundwaters of Pierce County are a limited resource and are projected to not meet future Pierce County population growth projections, other alternatives need to be considered.

**Spanaway Water Company**

As with most water systems, the Spanaway Water Company’s distribution system has developed over several decades. This evolution has created areas of older, undersized mains and newer lines sized for urban development. Facilities are regularly maintained and improved as set out in the Comprehensive Water System Plan and as pipelines are relocated during road improvements or other construction projects.

Spanaway Water Company has approximately 7,000 connections with 10,900 approved ERUs. Water sources include 10 active wells and an intertie with the Parkland Light and Water Company. Spanaway Water Company produces 6,445 gallons per minute with storage. Two water reservoirs have a combined capacity of 3.04 million gallons. Consumption is approximately 300 gallons per day per residential equivalent.

Spanaway Water delivers water to over 19,000 people. This population is projected to grow by 38 percent from year 2000 to 2020. Spanaway has its own groundwater source. Average annual water rights are reported to be 3.63 mgd, while instantaneous water rights are 14.41 mgd. Spanaway reported a total well capacity of 9.28 mgd. Based on demand projections provided by the utility, Spanaway’s average day demand will exceed annual water rights in year 2007. Peak day demand will exceed well capacity in year 2013. If they can be fully utilized, instantaneous water rights will be adequate to meet peak day needs beyond year 2020.

Spanaway Water is pursuing new water rights and transfers in its existing rights to meet its future demands. It has made one application to DOE for additional points of groundwater withdrawal, so that it may fully utilize its production capacity of 9.71 mgd. It also plans to redrill Well Number 5 to increase production. Full utilization of the capacity of Well Number 5 would require a transfer of part of its existing rights from Well 7 to Well 5.

The Spanaway Water Company Comprehensive Water System Plan, 1994 calls for a leak detection program to reclaim water that is lost from the system due to leaks, etc., the addition of pumping capacity to one well, and construction of a new well source. Construction of new Well #4 would allow for further system expansion. Potential exists for supply from other interties also. Two existing wells draw from Aquifer E, six from Aquifer C, and four from Aquifer A.
Tacoma Water Division

Tacoma Water was established in 1893 when it purchased the water system owned by Charles B. Wright, known as the "Father of Tacoma." Since that time, Tacoma Water has expanded its system considerably. Today, Tacoma Water’s service area includes the area within the corporate boundaries of the city, areas immediately adjacent to the corporate boundaries, and areas to the south and east of the city. Approximately 93 percent of the service area is in Pierce County, with 7 percent in King County. The service area is roughly bounded on the south by military bases; on the north by 272nd Street in southern King County; on the west by Puget Sound; and on the east by the Cascade foothills.

Tacoma Water’s current average day demand is approximately 70 mgd. Tacoma Water relies on the conjunctive use of surface and groundwater supplies to meet its current demand. A diversion on the Green River currently supplies approximately 85 percent of Tacoma Water’s annual demand, and groundwater sources supply the remaining 15 percent. Anticipated growth is expected to increase demand beyond the currently developed supplies. To determine the best approach to increase water use efficiency and to select an optimal mix of water supply and conservation options to meet future system needs, an integrated resource plan was developed. The benefits and costs of the various options available to Tacoma Water were weighted and an integrated resource planning strategy was produced that gives Tacoma Water the flexibility to develop any or all of a number of potential supply sources in response to changing future demands and policy directions.

Tacoma Water’s planning activities center on the need to meet increasing demands in an expanding service area, to address local, state and federal governments’ planning policies and regulations, and to satisfy Washington State Department of Health planning guidelines.

Since adoption of its 1980 Water System Plan, Tacoma Water has evaluated the need to provide regional water service, through retail, wholesale, and contractual service. In the current Comprehensive Water Plan Update, December 1998, Tacoma Water’s intent to provide regional water service has been confirmed.

Approximately 80 percent of Tacoma Water’s service area is within an urban land use designation, with the remaining 20 percent within a rural designation. A high level of water service is available in urban areas, consistent with service levels expected within cities. In nearly all areas, water service is nearby and available flow capacity is more than adequate for meeting customer needs. Fire protection is provided from fire hydrants or special fire line connections and water mains are close for all water service connections.

An evaluation conducted by the Washington Surveying and Rating Bureau in May 1997 found the condition of Tacoma Water’s facilities and firefighting capabilities to be very good. It was determined that the pipeline system delivers adequate supply for municipal use and fire protection throughout the service area.

Summit Water and Supply Company

Summit Water and Supply Company (Summit) currently serves approximately 5,175 customer accounts in north central Pierce County. Summit operates a gravity supply system with
approximately 3,850 gpm of source capacity an additional 500 gpm of booster capacity. Total storage volume is approximately 3 million gallons.

The water supply comes entirely from groundwater, originating from a total of nine wells at seven sites. One additional well is pending completion of construction. All water sources are treated with chlorine for disinfecting the distribution system. No other treatment has been issued, however, pilot testing and design of corrosion control is currently underway.

Summit has water rights for a total of 3,800 gallons per minute, and 2,130 acre feet per year. The Department of Ecology has also issued to Summit a water right permit for 1,500 gpm additional, and construction of this well is pending. Summit has interties with Tacoma, Fruitland Mutual, and SE Tacoma Mutual water systems.

The current water rights certificates appear to provide adequate instantaneous allocation to meet peak day requirements for the foreseeable future. However, the annual allocation appears to be sufficient for annual needs only until about 2010. The projected water requirements for the year 2020 is 2,252 acre feet. This exceeds the current annual allocation by 122 acre feet, or about 6%. This appears to be a reasonable amount to be recovered by improvement of water use efficiency. Therefore, it is possible that Summit does not presently have a priority need for new annual water rights.

On April 5, 2000, DOH approved Summit’s water system plan. The water system plan does not contain any major capital improvements. The water system plan indicates that the majority of the area is Rural Separator and its growth projections reflect mostly rural level development densities. Any changes to the rural land use designation within the Summit service area may create future water availability issues since Summit is nearing its annual water right threshold.

RAINIER WATER SYSTEM - SOUTHWOOD/ SOUND SYSTEM

The Southwood/Sound Water System is part of Rainier View Water Company, an investor-owned water company that runs several water systems in the South Hill, Frederickson, and Graham areas. The two systems were combined when Rainier View Water Company purchased the Sound Water System in approximately 1997.

All system water comes from groundwater sources. Twenty-six wells draw from various aquifers. Average daily production in the Southwood/Sound Water System in 1999 was 2.89 million gallons per day (mgd). Average daily water consumption was 349 gallons per day (gpd) per connection. The lost and unaccounted for water use approaches 45%.

Currently, the Southwood/Sound Water System is approved for 9,211 equivalent residential units (ERUs) by the Washington State Department of Health. As of year-end 1999, the system had 8,289 connections or 8,970 ERUs. According to the June 2000, Draft Water System Plan, the system has adequate water rights to provide domestic water supplies for approximately 11,602 ERUs on an annual basis and will meet peak demands for about 19,320 ERUs. This means that the system has enough water to add 3,313 ERU's beyond its 1999 year-end customer base, or 2,391 ERU's beyond the number of which Rainier View already has obtained DOH approval. At the system’s projected growth rate of 700 new residential connections per year for years 2000 to 2010, the Southwood/Sound Water System is capable of providing water...
to new customers through the year 2004. At this point in time, the Draft Water System Plan
does not address this potential shortfall nor does it provide a plan to obtain needed supplies.

The Draft Water System Plan contains several major capital projects including: Silvercreek
storage tank, Silvercreek well development, and Lost Creek main extension or booster pump
station. In addition, a leak detection survey and a main repair and replacement program are
proposed to address the high level of lost and unaccounted for water use.

**ISSUES FACEING WATER PURVEYORS**

Pierce County’s GMA plan has greatly increased densities in the communities of Parkland,
Spanaway, and Midland compared to pre-GMA times. While water purveyors are required to
plan for water system infrastructure needs based on the County’s Comprehensive Plan (or
city/town plan within incorporated areas), limited coordination between the County and
purveyors occurred during the preparation of the Comprehensive Plan.

A lack of water is different from a lack of infrastructure (i.e. sewer lines, roads) in that
infrastructure can be phased in, planned for or improved upon within a specified time period. If
a water system is at capacity, in terms of water rights, it may be impossible to obtain additional
water through new water rights. If possible, the timeline under which new water rights can be
obtained is impossible to predict. This is due, in part, to a large backlog of water rights
applications that may take the Washington State Department of Ecology (DOE) years to sort
through. Additionally, the Chambers/Clover Creek basin is closed to additional surface water
withdrawals.

The ability to use existing developed water rights outside of the area specified in the water right
through the use of transfers and interties is currently in question. While some utilities have
adequate existing water rights and production capabilities, others do not and are near, or in,
growth moratoriums. The above provision prevents utilities which do have excess capacity
from transferring water to those that do not.

Another issue that may have an impact on water supply is the effect of the Endangered Species
Act listing of Chinook salmon as threatened. One of the key elements of maintaining quality
salmon habitat is the availability of adequate stream base flows and clean, clear water within
those streams. Drawdown of the aquifers for human consumption of water is currently being
reviewed for its impact to stream base flows and will play into the DOE decision making process
when considering pending water right applications.

Another issue facing the ability of water purveyors to provide water is the potential impacts of
the installation of sewer systems on groundwater withdrawals due to shallow aquifer
dewatering. This can occur when groundwater flows along gravel pipe bedding rather than
recharging naturally or high water tables during sewer construction result in the need for
pumping actions that redirect groundwater resources outside its point of origin.

Water purveyors may use and promote water conservation methods as a means of ensuring
sufficient water supplies for growth. Conserved water is water that does not have to be
purchased or conveyed so it is cost-effective. Water conservation can be frustrated by
development regulations and homeowner covenants that require extensive irrigated
landscaping and similar features. Water conservation can be enhanced by requiring plumbing fixtures that conserve water, instituting leak detection and correction programs, and by developing strict irrigation and landscaping standards. Care in requiring landscaping that does not demand extensive irrigation for its survival will help as will emphasis in landscaping requirements on the use of indigenous plant materials and in land clearing regulations on the extent of vegetation removal. The following issues pertain to water conservation:

- Current Pierce County requirements at both the commercial and residential levels encourage water use rather than conservation.
- Pierce County has no mandatory landscape conservation requirements, instead the Zoning Code encourages conservation with the establishment of guidelines.
- Pierce County’s Zoning Code requires landscaping of commercial construction, including irrigation systems, that often leads to the use of non-native high water demand plants.
- No County regulations, such as a requirement for soil supplements or mulching material, exist to address land preparation for residential sites.
- Water conservation measures are often perceived as a quality of life issue given the perception that conservation measures require making due with less water.
- During the adoption of the County’s landscape ordinance, the County received comments from the local building industry which lead to the adoption of conservation guidelines rather than conservation requirements.

**Transportation**

**History of Transportation Planning in Pierce County**

The transportation policies and project list for the Parkland-Spanaway-Midland Communities Plan originated with citizen participation. In 1977, a dedicated group of residents, property owners and interested groups from Parkland-Spanaway worked with the Pierce County Planning Department to develop the Comprehensive Plan for Parkland-Spanaway that was adopted by the County Commissioners in 1980. The 1980 plan contained a Circulation Element with seven objectives that continue to influence the theme in today’s plan for the area.

In 1992, two plans were adopted that gave further guidance to the developing transportation system for Parkland, Spanaway, and Midland: The Joint Land Use Study (JLUS) and the Pierce County Transportation Plan (PCTP). The JLUS was a land use study undertaken by local jurisdictions and the military installations of McChord AFB, Ft. Lewis and Camp Murray. The JLUS provided policy guidance regarding land use issues and transportation issues surrounding the federal military installations. The four circulation recommendations contained in the JLUS were analyzed and their intent is included in the current plan for the PSM communities. The PCTP, also adopted in 1992, was the result of a four-year intensive public effort to develop Pierce County's first all-encompassing transportation plan setting policies and prioritizing transportation improvements for the following 20 years and beyond. The PCTP was organized into five main topic areas and each of those areas was evaluated for the appropriate policies and projects to be included in the PSM Communities Plan.
In 1994, the Pierce County Comprehensive Plan was adopted in response to the Washington Growth Management Act. The Comprehensive Plan relied upon the work done on the PCTP to set transportation policy and recommended transportation improvements. The Comprehensive Plan summarized a newly developed system for coordinating the planning, funding, programming, and construction of transportation improvements with future land development. This concept, known as transportation concurrency, continues to play a significant role in completing transportation improvements throughout Pierce County.

In 1997, the County adopted its first Nonmotorized Transportation Plan (NMTP). An extensive public involvement campaign was used to identify and prioritize pedestrian and bicycle policies and projects for the entire County. Since 1997, both the PCTP and the NMTP have been updated and combined into one Transportation Element contained in the Pierce County Comprehensive Plan. This chapter of the Pierce County Comprehensive Plan (Chapter 19A.80) was used extensively to develop the Parkland-Spanaway-Midland Communities Plan.

**CURRENT PLANS AND POLICIES**

The Parkland-Spanaway-Midland Communities Plan’s transportation policies and project list work in conjunction with the Transportation Element of the Pierce County Comprehensive Plan. The transportation guidance found in the PSM plan supplements the guidance provided in Chapter 19A.80. Transportation improvements that are financially programmed can be found in the County's most recent copy of the Transportation Improvement Program (TIP). The TIP is updated annually and provides a snapshot of the transportation improvements programmed for the following six years. The PSM Communities Plan and Chapter 19A.80 play a major role in determining which transportation improvements will be included in the TIP. The timing of projects and the phasing of various parts of projects are largely based on the anticipated funds available for each type of project. Unfortunately, the factors determining funding and priority can and do change from year to year.

The Pierce County Transportation Plan (Chapter 19A.80.100) includes policies detailing the process used to prioritize transportation improvement projects. The policies list criteria such as safety/accidents; congestion/level of service; incomplete transit, roadway, bicycle, pedestrian, and ferry systems; traffic impacting neighborhoods; and other criteria. The intent of the policies is to use a standardized, well-documented process to establish clear priorities for transportation expenditures in the County. The Pierce County Transportation Plan also states that the first priority is to maintain or upgrade existing facilities to serve existing residents and business at acceptable levels of service; second is to upgrade or build new transportation facilities to encourage and support growth and economic development in the more urban areas of the County; and third to upgrade or build new transportation facilities in the more rural areas of the County.

The GMA requires that the Comprehensive Plan contain level of service standards for all arterials and that it offer specific actions and requirements for bringing "any facilities and services, including transit services that are below an established level of service standard." The Capital Facilities (CFP) Element of the Comprehensive Plan describes the method by which Pierce County has established level of service standards for its transportation system. This
methodology employs screenlines that cross one or more roadways and monitor specific service standards. The service standards and applicable screenlines are detailed in the Capital Facilities Element.

ROADS AND HIGHWAYS

An evaluation of the roads in the PSM area was completed for the year 2020 using the County's traffic-forecasting model. Assuming all of the projects in the plan are built, the model showed that most of the roads will function adequately except for State Highways 7 and 512 during the PM peak hour. Spanaway Loop Road, Golden Given Road, Brookdale Road, and 8th Avenue E. will also experience some congestion during the PM peak hour in the year 2020. Therefore, according to the County's traffic-forecasting model, most of the roads in the PSM area will function adequately if all of the planned projects are built by the year 2020.

Other issues evaluated during the planning process include safety, maintenance, neighborhood, environmental, mobility, and funding. The transportation system being proposed is intended to reduce the number of collisions, especially those involving pedestrians, reduce high speeds, and improve visibility at curves and hills. There are policies emphasizing the importance of maintaining existing roads and building new roads to serve planned growth rather than as stimulators to unplanned growth. Following that line of reasoning, committee members also emphasized the importance of existing neighborhoods and environmental values. These include preserving the white oak trees and keeping neighborhoods intact by routing new arterials around rather than through neighborhoods. The community would like to see the nonmotorized and transit systems improved in their area to reduce the number of cars traveling through their communities. The committee recognized the importance of the nonmotorized and transit systems in providing mobility for people of all physical abilities and socioeconomic standing. Committee members all had personal experiences with people who were not able to own or drive a car due to age, disability, or income, yet still required some means of access to conduct their lives. Included in the plan is a set of nonmotorized and transit policies meant to complement the policies found in Chapter 19A.80.

Representatives of Pierce Transit, WSDOT, and Pierce County explained the funding situation for transportation improvements. Pierce County staff explained that 40% of the County's transportation revenues come from the road levy on property taxes. Another 20% is usually generated from federal and state grants, while fuel taxes and vehicle license fees generate another 20%. The remaining 20% is provided from other government agencies, ferry receipts, forest taxes, and miscellaneous sources. Ninety percent of these revenue sources are expended on construction, maintenance, and their related administrative costs. The remaining 10% supports engineering and planning, equipment purchases, ferry operations, and commute trip reduction programs.

Countywide, it is estimated that the planned transportation improvements will cost a little over one billion dollars over the next 20 years, but only 369 million dollars in revenues is expected. The state highway needs within Pierce County over the next 20 years are estimated to cost just over 2 billion dollars while revenues are estimated to equal 1.79 billion dollars. Therefore,
either additional revenues need to be raised or planned improvements need to be reduced in size or number.

**Rail Services**

The Tacoma Rail Mountain Division owns the railroad lines traveling through the Midland and South Spanaway areas. The section of rail line running through the Midland Community Plan area is approximately 2.4 miles. The section of line running through the Spanaway Community Plan area is approximately .4 miles long. Growth in freight volumes and customers has increased since Tacoma took over the rail lines two years ago. Currently freight is carried between Frederickson, a Thurston County customer, and the Port of Tacoma. Freight is carried on the rail lines seven days a week and improvements are being made to run freight from the Elbe area before the end of 2001.

Passengers may be carried on the rail lines in the future. One possibility is to run a passenger train from Frederickson to connect to the Sound Transit regional rail in downtown Tacoma. Another possibility is a passenger train between downtown Tacoma and the proposed Mt. Rainier Resort near Ashford. The "Train to the Mountain" is in the planning stages right now, but would require an, as yet, unidentified partner to make the "Train to the Mountain" a reality.

**Public Transportation**

**Pierce Transit Service**

Pierce Transit provides several bus routes in the PSM Communities Plan area. Most of these routes originate and terminate at the Parkland Transit Center and travel west to Lakewood, north to Tacoma, or east to Puyallup. One route travels south to the Roy Y and Graham. The 72nd Street Transit Center is located on the border of the Midland area at Portland Avenue. The bus routes originating at the 72nd Street Transit Center also travel to Tacoma, Lakewood, and Puyallup. A park and ride lot exists at the Roy Y which is served by a bus route traveling between Graham and downtown Tacoma on SR 7 and 224th Street E.

The current funding situation for Pierce Transit is unsure as costs outweigh revenues with the loss of the vehicle license fee support. Pierce Transit is looking for revenue support at the State level or by increasing the allowable local sales tax levy within the Pierce Transit service area. The following proposed service additions are top priorities for Pierce Transit within the PSM Communities Plan area. These service improvements will happen eventually, but no funding support is currently identified.

- An extended route for bus #41 from the 72nd Street Transit Center to the Parkland Transit Center on Portland Avenue.
- A route from the 72nd Street Transit Center to the Tacoma Mall Transit Center on 84th Street.
- Increasing the frequency of route #46 on SR 7 and coordinating this service with the proposed Sound Transit Express Bus (see below).
Sound Transit is considering a new express bus on SR 7 between Tacoma, the Roy Y, and the Frederickson Boeing Plant. This potential new service to begin in 2001 or 2002 is being considered along with two other options in Pierce County. As the regional Sound Transit system expands, it should free up Pierce Transit buses to provide additional local service.

Another alternative that has been raised is new bus service on the proposed Cross-Base Highway linking Lakewood and Spanaway across the military installations. This service is dependent on construction of the new highway, future transit funding availability, and the customers available to support the new transit service.

As noted above, the Tacoma Rail Mountain Division is also considering the operation of a passenger train between Frederickson and the Commuter Rail Station at the Tacoma Dome. This proposed service is also dependent upon funding and community support for its implementation.

The Spanaway Air Strip is located east of and parallel to SR 7 between 176th Street and 192nd Street. The privately owned air strip provides a 2,700 foot long runway open to public use, fuel, and storage facilities for approximately 60 privately owned aircraft. In 1998, there were approximately 19,000 operations (take-offs and landings). The Spanaway Air Strip is the only airport in the PSM plan area.

There are many projects within the Parkland-Spanaway-Midland Communities Plan area included in the current 2001-2006 Pierce County Transportation Improvement Program (TIP). Large improvements include preliminary engineering for the proposed Cross-Base Highway that is currently in the environmental review process. The Cross-Base Highway is proposed to link Lakewood to Spanaway at 176th Street by crossing McChord Air Force Base and Fort Lewis Army Base. The PSM Transportation Committee listened to a presentation on the Cross-Base Highway and discussed the project's pros and cons. By a majority vote, the committee decided to keep the project on its recommended project list as a premier priority project. However, there are suggestions for improving the project including:

- Accommodating transit, HOV, and nonmotorized modes,
- Finding solutions to the wildlife impacts,
- Providing adequate facilities to handle the traffic at SR 7 and 176th Street,
- Implementing land use controls to prevent sprawl,
- Mitigating traffic impacts to existing neighborhoods,
- Minimizing impacts to military operations,
- Protecting existing plants, animals, hydrology, sensitive areas; and minimizing additional noise and light pollution,
• Implementing controls to minimize the potential for fire from the roadway.

A second large project programmed for the PSM area is the completion of the Spanaway Loop Road improvements from 14th Avenue to the intersection of 176th Street and Pacific Avenue. Spanaway Loop Road improvements will be coordinated with future Cross-Base Highway improvements to provide improved north-south connections and an additional east-west connection. The TIP contains many other projects programmed to begin or finish construction over the next six years. Some of these improvements will take place on 112th Street, 128th Street, 168th Street, and 176th Street. For the most recent information, one should review the Pierce County Transportation Improvement Program.

**TRANSPORTATION IMPACT FEES**

Pierce County is in the process of developing a transportation impact fee program to provide for the equitable financing of growth related transportation improvements. This action will provide Pierce County with a systematic way to equitably distribute the “fair share” contribution for transportation improvements from developers of new projects.

**LAW ENFORCEMENT AND FIRE PROTECTION**

**PIERCE COUNTY SHERIFF**

The Pierce County Sheriff’s Department (PCSD) is the primary law enforcement agency for the plan area. Central Pierce County (extending as far south as 224th Street) is served by a full service precinct (on South Hill) as well as other facilities providing specialized services.

The PSM plan area is served by the PCSD South Hill Precinct located at 271 John Bananola Way East. Additional facilities serving the area are located at the Sprinker Station (14824 S. C Street), Brookdale Station (1410 Brookdale Road East) and the County-City Building in downtown Tacoma. All of these facilities provide continual, but not exclusive service to the PSM plan area as follows:

• The South Hill Precinct provides patrol deputies and support, along with property crime detectives, clerical support, the Youth Emergency Services, unit and the Crime Analysis Unit.

• Sprinker Station is a storefront operation for walk-in service for the residents of the Spanaway area and is the home of the Community Support Team and School Resource Officers.

• Brookdale Station is the home of the PCSD Traffic Unit.

The County-City building is the location of most of the rest of the PCSD services, including Administration, Civil, Major Crimes Detectives, Forensics, Special Investigations Unit, and the Recruiting and Training sections.

The Central Pierce County patrol is divided into ten districts, serving approximately 180,000 people. Deputies are assigned patrol responsibilities for one or more districts (depending on
the number of deputies working a particular shift) for the period of eight or ten hours. Two patrol districts fall completely within the plan area.

As of March 2001, 45 patrol deputies and 6 sergeants were assigned to the South Hill Precinct. They are responsible for providing basic police services to the interior of Central Pierce County including the PSM plan area. These numbers can change over the course of the year and are subject to internal transfers.

In addition, 22 deputies and two sergeants are assigned to the traffic unit. This unit provides traffic accident investigation and traffic enforcement capabilities for districts 9-18, as well as occasional coverage in the two eastside resident detachments.

As noted above, the Community Support Team (CST) operates out of the Springer Station. This group consists of one sergeant and 7 deputies. This team's mission is to provide non-traditional and non-call driven police service to neighborhoods experiencing chronic public safety issues. The tools used by this group are as varied as the problems they confront and range from networking with the Washington State Department of Corrections to identifying and arresting felons creating community problems to assisting with grant applications to securing funding for street lighting in high crime areas.

In addition to the CST, school resource officers also work from this facility. School resource officers are assigned by school district and work directly in secondary schools to insure that these buildings remain safe and secure during school hours. Currently two deputies are assigned to Bethel schools and one is assigned to Franklin Pierce schools.

Six detectives are housed at the South Hill Precinct to investigate property crimes, primarily in Districts 9-18. In addition, 22 detectives and deputies work from the County-City Building in the Criminal Investigations Division. Those people are assigned to a variety of tasks from investigating major crimes (homicide, special assault, arson, etc.) to investigating domestic violence related incidents to crimes involving juvenile suspects to executing felony arrest warrants. The area of responsibility for these resources is the entire unincorporated County (including the PSM plan area), as well as providing contracted services to various cities in Pierce County. A growing group of undercover investigators is dedicated to the various drug enforcement issues in Pierce County.

In addition to the above-described services, the plan area benefits from the ability of the PCSD to provide additional special services to its citizens. These special services are made possible by training personnel to perform more than their primary (patrol, investigations) function. These personnel respond to situations on an as-needed basis. These functions include: Air Operations, Clandestine Lab Team, Dive Team, Hazardous Devices Squad, Marine Services Unit, Bicycle Unit, Search and Rescue, SWAT, and Swiftwater Rescue.

**WASHINGTON STATE PATROL**

The Washington State Patrol's office is located at 2502 112th Street. This office dispatches four detachments to eastern Pierce County covering SR 7 (Pacific Avenue South) and SR 512 in the plan area. They respond to a variety of calls for service ranging from standard traffic stops to
vehicular accident investigation. The number of troopers in the plan area varies from two to three depending on the calls for service in other areas of Pierce County.

**FIRE PROTECTION**

Fire District No. 6 serves a population of 150,000 over an area of 72 square miles including South Hill, Summit, Elk Plain, and the PSM plan area. District No. 6 headquarters is at 17520 22nd Avenue East and the training facility is at 100 South 114th Street. There are a total of nine fire stations in the district with five located within the plan area boundary (#6-0, 6-1, 6-3, 6-4, 6-5).

The district offers a variety of services other than fire protection such as CPR and first aid classes and burn regulation information. Table I-11 and Table I-12 describe the facilities and equipment for each of the nine fire stations in the district.

PUBLIC SCHOOLS

The plan area is served by Bethel School District No. 403 and Franklin Pierce School District No. 402. The Bethel School District includes fifteen elementary schools, four middle schools, and three high schools, with a total building capacity of 13,031 students. The average full time enrollment for this school year is 15,739 students. The Franklin Pierce School District includes seven elementary schools, two middle schools, and three high schools, with a total capacity of 6,798 students. The average full time enrollment from September 2000 through January 2001 was 7,179.22 students. (See Map I-11: Public Education)

CAPITAL IMPROVEMENTS FOR ACHIEVING LOS

In February 2001, Bethel School District passed a Facility Improvement General Obligation Bond that will afford the re-construction of Kapowsin Elementary and the new construction of a junior and a senior high school. The Individual Capacity Project provides for an additional 750 students in the new junior high and 1,250 students in the high school for a total capacity increase of 2,000 by the year 2005. The school district’s current construction timeline plans for the elementary school reconstruction and the junior high construction to be completed in September 2003. The senior high plans to be completed in 2005.

PARKS AND RECREATION

HISTORY OF PIERCE COUNTY PARKS AND RECREATION

Prior to 1958, the Metropolitan Park District of Tacoma provided most of the park facilities and recreation programs throughout Pierce County. In 1958, the Board of Pierce County Commissioners created the Department of Parks and Recreation for Pierce County. At this time, several park sites outside of Tacoma were conveyed to Pierce County by Metro including Spanaway Park and Gonyea Playfield.

Subsequently, County Parks acquired and constructed additional parks and recreation centers including Lake Spanaway Golf Course and Sprinker Recreation Center (SRC.) SRC ice arena opened in the late 1970s and soon became the only public ice skating rink in Pierce County. The Pierce County Parks Department continued to grow in the 1980s and 1990s and established many recreational programs such as the All Abilities Camp, Sound to Narrows Race, mobile recreation, ski school, martial arts, aerobics, Tour de Pierce, Carless Commute, Cooperative Playshops, and sports leagues. Fantasy Lights at Spanaway Park provides a holiday light display which served approximately 107,000 in 1999. Today, it is estimated that over 3 million people utilize Pierce County Parks and Recreation facilities and programs annually.

OVERVIEW OF CURRENT COUNTY PARK & RECREATION POLICIES AND REGULATIONS

PIERCE COUNTY COMPREHENSIVE PLAN

The Pierce County Comprehensive Plan contains general policies that serve as a guide for future development of park and recreation facilities in the County. These policies cover a range of
issues including responsibility for provision of parks, technical assistance, and location criteria for new parks.

Section 19A.20.090 states that the primary reliance is upon cities and towns and special purpose districts as providers of local facilities and services appropriate to serve those local needs. The location of park and recreation areas is discussed in Section 19A.30.160 which states that new parks must be located on public roads. If a park is located in an urban area, then urban services need to be available. Open space passive recreation parks should be located on land offering significant environmental features. Also addressed in this section are multi-purpose trails, joint venturing, and partnership with others in regional facilities.

Section 19A.30.160 B contains policies on the responsibilities of the County including: limiting taxpayer investment to acquisition; development and maintenance of regional facilities; providing assistance in helping communities identify local park and recreation needs and funding opportunities; and implementing the Capital Facilities Plan element as a level of service (LOS) for parks and recreation. Technical assistance for the development, operation, and maintenance of local parks and facilities may include technical planning, help in the formation of local recreation service areas, service districts, city/county service area agreements (joint ventures), and self-help agreements with user organizations. The community planning efforts currently underway serve as a mechanism to address community values and needs for local parks and recreation activities.

PIERCE COUNTY COMPREHENSIVE PARK, RECREATION, AND OPEN SPACE PLAN

The Pierce County Comprehensive Park, Recreation, and Open Space Plan (referred to as the Parks Plan) provides general direction and guidance for both facilities and programs. The Parks Plan does not contain site specific plans for each of the County’s properties. These site-specific plans have been prepared, modified, and implemented as needed over the decades. One example of a site specific plan is the newly created Sprinker Recreation Center Master Site Plan.

PIERCE COUNTY DEVELOPMENT REGULATIONS

Title 18A, Development Regulations-Zoning, Section 18A.35.025 contains standards for minimum residential amenities, which includes provisions for on-site recreational areas. These standards require the dedication of land for recreational purposes.

SRC MASTER SITE PLAN PROCESS

SRC is operated in accordance with the Comprehensive Park and Recreation Plan (Parks Plan). The original 1975 site plan for SRC has continued to govern development of the site with only a few modifications, such as spire rock and the imminent reconfiguration of the outdoor track area.

In 1999 the County Executive and County Council decided to initiate a formal process to develop an updated Master Site Plan in response to a variety of proposals, concepts, and ideas that have arisen over the last few years regarding future activities involving SRC and adjacent grounds. The planning process was initiated in two phases. Phase I included a background analysis, public involvement process, and visioning process for SRC. This information was then
forwarded to the County Council with a set of recommendations from the County Executive. A future phase II will involve preparation of a long-term plan on strategies to make the facility more economically self-sufficient and implementation of phased improvements and potential expansion of the facilities, uses, and services provided at SRC.

**Description of Parks and Recreation in the Plan Area**

Table I-13 provides a list of park sites located within the plan area.

<table>
<thead>
<tr>
<th>Site</th>
<th>Classification</th>
<th>Acres</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sprinker Recreation Center</td>
<td>Resource Activity</td>
<td>35</td>
<td>Located north of Military Road and west of C Street in Spanaway. Regional level complex comprised of a multi-use facility that contains meeting/craft rooms, ice rink, indoor tennis courts, and handball/racquetball courts; 35 acres of multi-purpose competition fields; children’s play equipment; hard surface play areas; basketball courts; climbing rock.</td>

</table>
FUNDING STRATEGIES FOR COMMUNITY AND NEIGHBORHOOD LEVEL PARKS

As discussed previously, the County is a provider of regional parks and facilities. Local parks, also referred to as neighborhood and community parks, are no longer provided by the County. Existing local parks are currently maintained by the County and available for public use, however the County is exploring the options for other public agencies to assume stewardship of local parks.

PIERCe COUNTY LIBRARY SYSTEM

The plan area is served by the Pierce County Library System. The Parkland-Spanaway branch library has a total floor space of 15,576 square feet, 4 full-time and 17 part-time library staff, and is open 54 hours per week. There are approximately 90,038 cataloged books with a total collection size of 126,215. It serves as a Regional Reference Center for the surrounding PSM community.

ELECTRICITY

The Parkland, Spanaway, and Midland communities are serviced by five electric service providers and one natural gas system.

ELMHURST MUTUAL POWER AND LIGHT COMPANY

Elmhurst Mutual Power and Light Company (Elmhurst) serves the southern portion of the PSM plan area. Elmhurst is a non-profit member owned utility established in 1922 and serves an area of 28 square miles. The approximate service boundaries are McChord Air Force Base to the west, 86th Avenue East to the east, 128th Street East to the north, and 170th Street east to the south. The service area includes Sprinker Recreation Center and Spanaway Golf Course. Elmhurst Mutual serves 13,000 customers with a ratio of 80% residential and 20% commercial. Four power substations with a capacity of 100-megawatts provide the power source for the electrical customers served. The electrical system is a 12,470-volt system with a system of ties between each substation. Bonneville Power Administration provides the high voltage tie to Elmhurst’s power needs.

PUGET SOUND ENERGY

Puget Sound Energy (PSE) provides both natural gas and electric services to portions of the Parkland-Spanaway-Midland communities.

PSE provides natural gas service to a total of 6,741 customers, including 6,095 residential, 634 commercial light industrial, and 12 large industrial customers. PSE experiences greatest natural gas usage during the winter heating season. On an average winter day (28 degrees F), peak usage for this area is approximately 6.7 million cubic feet/day. Primary sources of natural gas are from the Frederickson Gate Station and the South Tacoma Town Border Station, which receive natural gas from the inter-state pipeline operated by Williams, Inc.
The natural gas is then distributed via high-pressure and intermediate pressure gas mains into individual service lines at the customer’s property. Two primary high-pressure mains are located within the plan area. One high pressure main is located on South 112th Street. The other main traverses the region from the southeast at Brookdale Road to the northwest at Steele Street.

PSE provides electric service to a total of 1,441 customers, including 1,339 residential, 29 commercial, and 73 other (primarily farm and water well) customers. These customers are served from two separate substations, the Fern Hill Substation and the Spanaway Substation. Both of these substations are outside of the communities plan boundary. Primary electrical feeders for the PSM Communities Plan area are along Park Avenue, South 168th Street East, and B Street. The existing electrical distribution system can accommodate an approximate 40% growth based on current customer load requirements.

**Lakeview Light and Power**

Lakeview Light & Power (LL&P) was established in 1922 as a mutual, non-profit cooperative owned by its members. The size of the service area is approximately eight square miles and serves approximately 9,100 customers in the Lakewood and Parkland areas. Of these services, 7,000 are residential, 1,300 are commercial, 350 are industrial, 150 are public (city, state, churches, schools, etc.). Lakeview serves 1,200 customers in the plan area.

Electric service is provided by four substations with a total capacity of 42.75 megawatts. Each substation capacity has a transformer capacity of 26.6 megawatts in the winter in order to manage the system during its peak load. The system voltage is 12,470 where Tacoma Power delivers 115,000 volts to each substation. The historic peak load in 1994 was approximately 58.9 megawatts.

**Parkland Light and Water Company**

Parkland Light and Water Company (PL&WCo) was established in 1914 as a non-profit member owned electric and water utility. PL&WCo currently serves approximately 4,000 electric meters. The electric service area is four square miles centered along Pacific Avenue, between 104th Street and 131st Street South.

Electric service is provided from two substations with a combined capacity of 50 megawatts. PL&WCo’s historic peak load has not exceeded 30 megawatts. Underground distribution feeders extend throughout the service area. The last remaining customers receiving service from the old overhead lines will be converted to the underground electric service system by 2002. The underground facilities are all relatively new and have the capacity to serve maximum load projected in the current growth management plan.

**Tacoma Public Utilities**

Tacoma Public Utilities (TPU) provides electrical services, a 12,500-volt distribution system, to the Midland area and a small section of Parkland and Spanaway areas. Midland is served by TPU’s Polk substation located at 2317 97th St. E. The substation capacity is 23.75 megawatts.
with approximately 37% available capacity. Part of Parkland is served by TPU's Croft substation located at 9609 Barnes Lane South. The substation has two transformer banks with a total capacity 32.59 megawatts, with approximately 42% capacity available. Part of Spanaway is served by TPUs’ Crescent Substation located at 19114 22nd Ave. E. The substation capacity is 23.75 megawatts with approximately 36% capacity available.

**SOLID WASTE AND RECYCLING**

Curbside pickup of refuse, recyclables, and yard waste is available to all single-family residences by Pierce County Refuse, the hauling company franchised to serve the area under the authority of the Washington Utilities and Transportation Commission. The company, a subsidiary of Harold LeMay Enterprises, also provides collection of refuse and recyclables from multifamily residences, condominiums, mobile home parks, and from commercial customers. Recyclables collected at the curb include all colors of glass, newspaper, cardboard, mixed waste paper (including magazines), and all tin, steel, or aluminum cans.

Those who choose to self-haul can take refuse, yard waste, and recyclables to the Hidden Valley Transfer Station south of Puyallup. Yard waste is accepted at a reduced rate and is composted and turned into a valuable soil amendment or mulch. Yard waste, land clearing debris, and other recyclables can also be taken to the many private recycling facilities existing in the plan area. Yard waste cannot be burned since the plan area is within the permanent burn ban area established by the Puget Sound Clean Air Agency. It is also against the law to burn refuse.

Household hazardous waste, such as oil-based paints, pesticides, anti-freeze, or used motor oil, can be taken free of charge to the City of Tacoma’s Household Hazardous Waste facility located at the Tacoma Landfill. The Tacoma-Pierce County Health Department maintains a hazardous waste hotline to answer questions about proper disposal of hazardous waste. Questions about where to take other items for disposal or recycling can be directed to the Pierce County Public Works and Utilities Department, Solid Waste Division which maintains a current list of private and public facilities handling waste and recyclables. The Solid Waste Division has a full range of public outreach and education programs about all waste and recycling issues, including environmental education for school districts, adult workshops, and many publications.

**STORMWATER FACILITIES**

Stormwater flowing from impervious surfaces is typically associated with higher density residential developments, commercial sites, and in industrial areas, however, any road, roof, or compacted turf can add to the level of impervious cover in an area. Any impervious surface can contribute a variety of pollutants to the surface water, but typically commercial areas have higher concentrations of the metals, oil, petroleum, and other compounds than runoff from other surfaces. Many of the fluids and metals that are produced by cars have a higher toxicity than pollutants from other sources. In addition, paved surfaces can increase the speed and amount of water leaving a site. This increases the size of the drainage collection and conveyance systems needed to accommodate the additional flow and can impact natural systems such as creeks.
In July 1995, Pierce County was issued a National Pollutant Discharge Elimination System permit from the Washington State Department of Ecology. This permit regulates both the quality and quantity of stormwater in new development as well as existing structures. To implement this permit, Pierce County adopted the following local regulations:

- Stormwater Management & Site Development Manual – Provides guidance on reducing stormwater flows and erosion from new construction.
- Best Management Practices Manual – Provides guidance on ways in which existing businesses and residences can reduce or prevent pollution.
- Illicit Discharge Ordinance – Makes it illegal for any business or individual to cause Pierce County to violate its permit. It includes an inspection program.

### DESCRIPTION OF PROJECTS

Several large capital improvement projects (CIP) have already been built within the plan area to help manage stormwater. Existing projects include:

- **North Fork Clover Creek (E-1)** – 100-acre-foot detention pond located at 128th St. & Waller Road to reduce stormflows on Clover Creek. This pond will help reduce both flooding and channel erosion problems downstream. Although located outside of the PSM planning area, this project will significantly impact portions of the plan area.
- **Paradise Bowl** – Infiltration pond located at 124th & A St E. to eliminate downstream flooding on C Street.
- **North Fork Clover Creek #1 & #2** – Channel excavation and culvert replacement to increase flood conveyance capacity.
- **Pacific Ave. & 106th St. E.** – Pipe system to relieve flooding along A Street.

Construction of the following facilities will further help to mitigate the cumulative impacts of past development and growth within the plan area. Following is a brief overview of each of these projects:

- **128th St. E. & 14th Ave. (W-1)** – 80-acre-foot detention pond located at 128th St. & Aqueduct Road to reduce stormflows on Clover Creek. This pond will help reduce both flooding and channel erosions problems downstream. Although located outside of the PSM planning area, this project will significantly impact portions of the plan area.
- **136th St. E - "A" St. E. to "B" St. E.** - Instream and shoreline habitat improvements to mitigate impacts of culvert installation and road elevation in 2001.
- **Clover Creek Channel Modification** - Install clay liner in sections of creek where summertime flows disappear. Habitat improvements. Locations not determined at this time.
- **Spanaway Airport** – Pipe and ditch conveyance system to address groundwater flooding near SR 7. The intent is to allow the water to reach Coffee Creek.
- **Clover Creek & Spanaway/Maury Creek Habitat Acquisitions** – Begin process of acquiring and enhancing flood prone property that also has significant fish habitat value.
- **Glen Oaks** – Infiltration pond to address local flooding.
- **North Fork Clover Creek.** – One more detention pond on Clover Creek to further reduce the chance of flooding downstream. The site for this pond has not been selected.
Surface Water Management levels of service (LOS) are established in the Pierce County Capital Facilities Plan (CFP). In general, sizing of all major ponds and conveyance systems is for the 100-year storm, given future build-out based on current zoning. Ponds are sized using both 24-hour events and 7-day events, whichever is larger. All infiltration facilities have water quality features to protect groundwater quality. Detention ponds usually include designed water quality features, typically to reduce maintenance costs or to protect in-pond wetland features. An important caveat is that sometimes because of land availability restrictions or other factors, SWM may not be able to fully meet this LOS, but will still build the project to the best ability. This stems from the philosophy that “doing something to reduce the frequency and severity of flooding is better than doing nothing at all.” In addition to flooding, the Water Programs CIP addresses water quality concerns and areas of habitat degradation.

In general, the solutions for flooding problems are, in order of preference, infiltration, detention, floodplain acquisitions, or conveyance improvements, or floodplain acquisition. Improving conveyance has the potential to simply move the flooding problem downstream and is only done after significant downstream analysis. Since most projects are installed to address existing drainage problems, the UGA line is not a significant factor in prioritizing needed projects. Water Programs is currently conducting watershed basin plans for the Clover Creek and Clear/Clarks Creek Basins. Once complete, data from these studies should help determine future capital improvement projects within these basins, as well as prioritizing capital expenditures for such improvements.

**DESCRIPTION OF DESIRED CONDITIONS**

**SEWER AND WASTEWATER TREATMENT**

Best construction methods and practices and conservation measures should be applied to reduce impacts to the natural environment and surrounding neighborhoods, associated with construction of sewer utilities. Sanitary sewer facilities should be located within existing rights-of-way, whenever possible and construction activities should avoid critical areas and sensitive time periods in the lifecycle of fish and wildlife, such as spawning, nesting and migration. Coordination of sewer facility construction with other utilities and agencies also minimizes ongoing disruption of transportation systems and disturbance to fish and wildlife. Contamination protocols should be utilized during construction of sewer utility projects to reduce the risk of pollution infiltration into the sole source aquifer. Implement conservation measures that minimize the volume of water that has to be conveyed and treated by sewer utilities.

**DOMESTIC WATER SYSTEMS**

The plan area is served by several different domestic water systems. Pierce County and water purveyors should coordinate their activities to ensure that an adequate and reliable domestic water supply is available to support projected population growth. The availability of an adequate potable water supply should be verified prior to the approval of new land divisions. If
water purveyors are incurring problems supplying water for new land divisions, then they should explore connections (interties) with other water systems that have adequate water supplies. In addition, Pierce County should continue to develop the Pierce County Water Utility as a source of wholesale water for purveyors operating within Pierce County.

**TRANSPORTATION**

The transportation component of the Facilities and Services Element of the Parkland-Spanaway-Midland (PSM) Communities Plan provides a foundation for the improvement of transportation facilities in the PSM area.

A comprehensive transportation system within the plan area should include a viable set of transportation alternatives. A mass transit network that offers area-wide coverage, rider convenience, and low cost fares to all community residents should be a major consideration of any complete transportation system. A program should be undertaken to improve traffic flow, safety, and access. The program should include continual maintenance, proper siting of new facilities, and meeting annual needs for new signs, signals, and control systems.

Future roadways should be sited to maintain existing neighborhoods and protect vital environmental features. By following the land’s natural contours and developing a keen awareness of citizen needs, roads can be located such that they have a positive effect on community form.

The intent of this element is to reduce the environmental impacts of roads and automobiles while enhancing the communities' livability. Through sign controls, the utilization of natural vegetation along roadways, parking areas, and other measures, the negative aesthetic and pollution impacts can be minimized. Careful consideration should be given to preserve the scenic character and natural beauty along existing and future roads.

Future transportation improvements should be completed based upon a prioritization of projects considering existing safety issues, community needs and desires, and costs. Some of these improvements are already identified in the Pierce County Comprehensive Plan and Pierce County Nonmotorized Transportation Plan, however, several new projects have been listed to address community concerns.

**LAW ENFORCEMENT AND FIRE PROTECTION**

**LAW ENFORCEMENT**

The two separate entities providing law enforcement within the community plan area should provide support outside of their primary jurisdictional territory when necessary.

The level of service standard for Sheriff Department buildings is calculated in the Pierce County Comprehensive Plan at .31 square feet of office space per capita. This method for evaluating the LOS for Sheriff services may not be the most accurate or best approach. The County should evaluate the number of on-duty commissioned officers within the plan area to determine if a more accurate LOS is appropriate. Requiring an LOS based on the number of on-duty
commissioned officers in the community would more accurately reflect the true LOS in the community.

**FIRE PROTECTION**

Cost-effective fire protection services should be maintained in the community. Response times should not exceed the current average of 4-½ to 6 minutes throughout the communities plan area. Pierce County and the County’s Fire Prevention Bureau should continue to support the efforts of Fire District #6 in responding to the increasing population and demand for services in the plan area. Enforcement of fire and life safety codes should continue to be part of the review process for all building permits issued by Pierce County.

**PUBLIC SCHOOLS**

Bethel School District Number 403 and Franklin Pierce School District Number 402 provide public education facilities in the communities plan area. Pierce County should coordinate future capital facilities planning with these school districts. School district facility needs and requirements should be considered when making land use decisions that could impact district facilities. New schools should be sited in the UGA near the student population that would be served by the proposed school facility.

The student enrollment should not exceed classroom capacity. School impact fees should be paid to the district to adequately mitigate the impacts to school facilities that are generated by new residential growth within the communities plan area.

**PARKS AND RECREATION**

**PARKS**

While it appears that the Parkland-Spanaway-Midland Communities Plan area contains a high number of parks, many of these facilities are large, regional-level facilities that are concentrated in one location within the community of Spanaway, and thus there is a perceived lack of equity in distribution. There is a strong desire to have more neighborhood and community level parks (that contain picnic areas, walking trails, and small playgrounds) spread evenly throughout the communities. An adequate level of these parks should be provided based upon the population density within the plan area.

Park areas should be located, designed, and maintained to meet the needs of a growing population. It is important that neighborhood and community parks be located within walking distance from large concentrations of residential development and connected, when possible by nonmotorized transportation paths or trails, which serve pedestrians or bicycles. These park areas should create a balance between active recreation uses and natural open space areas and when possible, incorporate historical or educational components. Maintenance of existing facilities and enforcement of park rules should be increased.
Finally, in these times of lean government expenditures, finding funding sources for acquisition and maintenance of new park facilities is a challenge. However, when properties suitable for neighborhood and community parks become available, they should be purchased and put in trust for future development. Existing County-owned land should be reviewed to determine if any portion of these parcels is suitable/usable for parks. Public and private partnerships for development of parks should be encouraged, and where feasible, incorporated into publicly funded community development or block grant housing projects. Specific funding mechanisms for acquisition, development, and maintenance of neighborhood and community parks, such as instituting development impact fees or establishing a park district that has the ability to issue general obligation bonds or collect excess levies, should be provided. As a means to provide a more even distribution of parks, levels of service (LOS) for neighborhood and community parks should be based upon the population density within each community and such levels established in policy. Existing parks and any new park sites that are acquired should be adequately protected, through a conservation easement or covenant, so that they will remain in such capacity in perpetuity.

**RECREATION**

Within the three communities, there is a strong desire for more facilities and programs for young children and teenagers. Both Midland and Spanaway residents expressed a need for a community center, which should be designed to meet the objectives of a variety of ages. Additional recreational programs/activities should be established throughout the three communities and include: garden clubs; neighborhood level tennis and basketball courts and baseball fields; a swimming pool; and trail systems for bike riding and walking. Private recreation facilities should be encouraged throughout the community as well. Opportunities to increase the number of recreational programs, through joint use agreements with the local school districts, should be explored. Recreational programs and facilities should be designed to be flexible in accommodating new recreational opportunities that may arise in the future (e.g., skateboarding and rollerblading.) Whenever feasible, partnerships should be encouraged and funding priority be given to cooperative operational arrangements, shared facilities, and community needs (e.g., school districts).

**SPECIFIC COMMUNITY ISSUES**

**MIDLAND**

Dawson Playfield should be preserved and upgraded. The County could explore the opportunities to place a conservation easement on this site. A community level park should be developed in Midland in the vicinity of Golden Given and 105th Street E. This site should be targeted for the development of a community center, unless another existing facility, suitable for a community center, can be found. Smaller neighborhood scale parks should be acquired and developed at various locations within the Midland community.
**Parkland**

Gonyea Park should be further developed and expanded to include the wooded lot across from the park. The wooded area should then be developed with trails and paths for people to explore and enjoy a natural setting. Additional trees should be planted in Gonyea Park to help define the different activity areas. Neighborhood park sites should be acquired and developed, especially east of Pacific Avenue (Eastern Parkland). A linear trail and park system should be developed along both banks of Clover Creek with interpretive and educational materials that provide information about the resident fish and wildlife populations and their particular life cycle needs. Where possible, this linear corridor should be connected to designated open space sites. Opportunities to create partnerships with local land trusts, environmental organizations, and universities to acquire or develop these areas should be explored.

**Spanaway**

While Spanaway is rich in regional level parks, there are no existing community or neighborhood parks within the community. A community park should be acquired and developed in south Spanaway. Several neighborhood level parks should be acquired and developed throughout the community. Sprinker Recreation Center (SRC) should be expanded and improved in accordance with the recently developed SRC Master Plan and consistent with community expectations and needs. SRC should be modified to include accommodations for youth and teens, perhaps with the addition of a Boys and Girls Club.

**Pierce County Library System**

The plan area is served by the Pierce County Library System. The 15,576 square foot Parkland-Spanaway library is classified as a regional branch library. This library service should continue to be provided in the community and the LOS should keep up with population growth. Any additional library facilities should be located within the UGA in a location that is convenient to people using them.

**Electricity**

Reliable utility service should be provided in the communities plan area to accommodate growth in a way that balances public concerns over the impacts of utility infrastructure with the consumer's interest in paying a fair and reasonable price for utility products. Utility providers should consider the community's natural environment and the impacts that utility infrastructure may have on it together with the community’s desire that utility projects be aesthetically compatible with surrounding land uses when planning for and constructing utility facilities.

Regional electrical and natural gas facilities should be permitted in the plan area. Pierce County should support expansion of electric utility facilities to meet future load requirements and support conservation measures to aid in meeting future growth needs.
SOLID WASTE

The plan area should be provided with an environmentally sound, economically responsible means of solid waste management that balances the need for this service with the costs of waste disposal. Pierce County should encourage recycling and promote programs that reduce the volume of solid waste. Private industry should be encouraged to provide sufficient disposal capacity for waste collection and processing capacity for recyclables produced in the plan area. All residents of the plan area should have access to refuse disposal and recycling collection services.

STORMWATER FACILITIES

Stormwater runoff and flooding control are major issues within the plan area. While the new Site Development and Stormwater Drainage regulations do a much better job of controlling stormwater impacts of new development, development that has occurred over the last several decades has left cumulative impacts that will need to be addressed through the construction of new regional stormwater facilities or acquisition of land for flood storage. Completion of basin plans, coordinated with community plans, will identify future capital improvement needs and priorities.

PARKS AND RECREATION POLICIES

PARK SITE ACQUISITION

GOAL PSM PR-1  Focus on park site acquisitions that serve to expand existing facilities.

   PSM PR-1.1  Expand Gonyea Playfield with an extension to the Hope property through walking trails and road-crossing striping.

   PSM PR-1.2  Expand Dawson Playfield by adding any vacant adjacent parcels to provide more park/open space area.

   PSM PR-1.3  Priority should be given to expanding a system of community and neighborhood level parks that are within walking distance of residential neighborhoods.

GOAL PSM PR-2  Purchase additional land throughout the plan area for future development of park facilities.

   PSM PR-2.1  High priority areas for future park acquisition include:

      PSM PR-2.1.1  Areas around Ford Middle School and Harvard and Midland Elementary schools;

      PSM PR-2.1.2  169th and 170th and SR 7;

      PSM PR-2.1.3  Around the Spanaway Speedway (22nd and Military Road);
PSM PR-2.1.4  176th past B Street by the Prairie House Museum (Spanaway Historical Society) located at 824 E. 176th Street;
PSM PR-2.1.5  South Spanaway area;
PSM PR-2.1.6  South of Tule Lake Road and Clover Creek and along the edges of Clover Creek and North Fork Clover Creek;
PSM PR-2.1.7  Larger park or several smaller parks south of 152nd and east of SR 7;
PSM PR-2.1.8  Golden Given and 105th Street E.;
PSM PR-2.1.9  C Street on the south side of Clover Creek;
PSM PR-2.1.10 A Street and B Street and along 132nd, 133rd, 134th, etc.; and
PSM PR-2.1.11 Other designated locations along Clover Creek.
PSM PR-2.2  New level of service standards for recreational facilities on existing park sites should be achieved in conjunction with acquisition of raw land.

**Park and Recreation Facility Development and Level of Service (LOS) Standards**

**GOAL PSM PR-3**  Explore alternative methods of funding regional park and recreation facilities.

**PSM PR-3.1**  Pierce County should continue to operate Sprinker Recreation Center (SRC) as a regional park facility and pursue additional private vendors (such as soccer clubs) as a means to enhance programs and activities.

**PSM PR-3.2**  Explore sponsorship opportunities to support recreational programs at SRC.

**PSM PR-3.3**  Continue to improve the financial performance of SRC, including regular increases in fees to help pay for actual costs of operating and maintaining league play, and savings from operational efficiencies.

**GOAL PSM PR-4**  The County should assist the community to develop a funding mechanism for the acquisition and development of local park and recreation facilities. The standards below provide recommended policies to guide this effort:

**PSM PR-4.1**  Support the creation of a park service area to help fund and develop community and neighborhood level parks throughout the plan area.

**PSM PR-4.2**  Require an impact fee, land dedication, or fee in lieu of dedication for community and neighborhood parks based upon the adopted LOS standards set forth in the technical appendix.

**PSM PR-4.2.1**  Amend existing development regulations to ensure consistency with the neighborhood level of service standards set forth in the technical appendix.

**PSM PR-4.2.2**  At such time as a park service area is formed, an impact fee or fee in lieu of dedication program for community parks should be developed and administered by Pierce County. Collected fees should be transferred to the park service area for park acquisition and development within the plan area.
PSM PR-4.2.3  New Master Planned Communities should be required to dedicate land for the development of community parks that are available to the general public.

PSM PR-4.2.4  Require all new residential lots or new residential units on lots of record to pay an impact fee, dedicate land, or pay a fee in lieu of land dedication for the development of local parks. The structure of each of these options shall be correlated to the LOS standards set forth in the technical appendix.

PSM PR-4.2.5  In no case shall a required dedication of land within a residential development be less than 5,000 contiguous square feet.

PSM PR-4.3  Where appropriate, develop park facilities that generate funds. Incorporate revenue collection into the design of new community and neighborhood parks.

PSM PR-4.3.1  Consider charging user fees at sites that provide recreational opportunities at a rate that will support the facilities maintenance and operating costs.

PSM PR-4.3.2  Consider a sliding fee structure to allow fee discounts for low income and elderly individuals.

GOAL PSM PR-5  Maintain the countywide LOS for regional parks within the plan area.

PSM PR-5.1  Encourage the County to establish LOS standards for community and neighborhood level park and recreation facilities.

GOAL PSM PR-6  Ensure that publicly-owned park sites are protected and maintained in perpetuity.

PSM PR-6.1  Place conservation easements or covenants on existing and acquired publicly-owned park sites that restrict future uses to park and recreation activities.

PSM PR-6.2  Require any proceeds from sales of publicly-owned park sites located within the plan area be used to purchase an equivalent or greater amount of land within the plan area for park and recreation use.

PSM PR-6.3  The quality of the land needs to be the same or greater than that of any piece sold.

GOAL PSM PR-7  New parks within the plan area should be designed and located to serve the needs of all segments of the community.

PSM PR-7.1  The size of a regional park is typically 40 acres; however, these parks may be developed on larger or smaller parcels.

PSM PR-7.2  The size of a community park is typically 15 to 25 acres.

PSM PR-7.2.1  Access to a community park should be from an arterial street if traffic volumes are anticipated to be high, and parking shall be dependent upon the facilities provided. Restroom facilities should be provided at a community park.

PSM PR-7.3  The size of a neighborhood park is typically 5 to 10 acres.

PSM PR-7.3.1  Neighborhood parks should be separated from one another in a relatively even manner throughout the plan area.

PSM PR-7.3.2  Typically a one to two-mile separation is desirable.
PSM PR-7.3.3 Neighborhood parks should be reasonably central to the neighborhood they are intended to serve.

PSM PR-7.3.4 Access to a neighborhood park should be via a local residential street.

PSM PR-7.3.5 Walking and bicycle access routes should avoid physical barriers such as major arterial roads or stream crossings whenever possible.

PSM PR-7.3.6 Parking or restroom facilities are typically not provided at a neighborhood park.

PSM PR-7.4 Neighborhood parks should be developed adjacent to school sites whenever possible to promote facility sharing.

PSM PR-7.4.1 Facilities on the neighborhood park site should supplement uses that the school does not provide such as trails, open space, picnic areas, playground equipment, and multi-purpose paved courts.

PSM PR-7.5 Mini-parks shall be provided in all new residential subdivisions, multifamily complexes, mobile home parks, and senior housing developments.

PSM PR-7.5.1 Each mini-park should be improved with a variety of recreational amenities such as a playground, sports court, tot lot, picnic facility, gazebo, on-site water line, and associated landscaping.

PSM PR-7.5.2 When possible, open space tracts, screening buffers, and stormwater facilities should be connected with any mini-park to create the opportunity for a system of integrated walking trails.

PSM PR-7.5.3 At a minimum, there should be a mini-park every four or five blocks.

PSM PR-7.5.4 Require walking paths or trails that connect new residential developments to any dedicated mini-park area. Such paths or trails should not cross any major roadways.

PSM PR-7.6 Areas designated for parks should be located contiguous to other designated park or open space areas.

TRAILS

GOAL PSM PR-8 Utilize a classification system to distinguish the level of service (LOS) for each type of trail.

PSM PR-8.1 Major trails link destinations, provide for all user groups, and serve a regional scale.

PSM PR-8.2 Minor trails should provide access to local points of interest or unique environmental features, serve smaller user groups, and are typically at the community or neighborhood scale.

PSM PR-8.3 Maintain the countywide level of service for regional linear trails (major trails) within the plan area.
GOAL PSM PR-9  
Purchase additional land throughout the plan area for future development of trail facilities. High priority areas for future trail acquisition and development include:

PSM PR-9.1  
Along Clover Creek and North Fork Clover Creek;

PSM PR-9.2  
Parkland east and west - Tule Lake Road to accommodate five schools going to Parkland Prairie, Schibig farm, and Gonyea Park; and

PSM PR-9.3  
Parkland north and south - C Street to Park Avenue to Yakima Avenue to SRC.

GOAL PSM PR-10  
Require the dedication of major and minor trails during the site development process.

PSM PR-10.1  
Designated trails should be considered for each subdivision and site plan approval.

PSM PR-10.2  
When a site is located along a proposed trail route, then a linear section of land shall be dedicated and developed as a condition of approval.

PSM PR-10.2.1  
Such portion of land shall be credited toward any required park land dedication.

PSM PR-10.3  
When a site is not located along a proposed trail route, then a fee in lieu of land dedication shall be required to contribute toward the regional trail system.

PSM PR-10.4  
Required land dedications or fee in lieu of land dedications for minor (local) trails shall be based on the LOS standard described in the technical appendix and for major (regional) trails based on the LOS standard described in the Comprehensive Plan.

PSM PR-10.5  
Consider dedicating unopened rights-of-way and other public lands for trail purposes.

EXISTING PARKS AND RECREATION AREAS

GOAL PSM PR-11  
Conduct maintenance and renovations that serve to enhance existing regional park and recreation facilities and programs.

PSM PR-11.1  
Pierce County should continue the ownership and management of SRC and Bresemann Forest site for parks and recreation purposes and should complete the SRC Master Site Plan process (phase II and implementation strategy), and implement the recommendations contained in the phase I report including:

PSM PR-11.1.1  
Initiate discussions with Fire Protection District No. 6 regarding the status of the satellite fire station and the potential reacquisition of the district’s .60-acre parcel;

PSM PR-11.1.2  
Evaluate whether ice rink facilities can be expanded at SRC by adding a second sheet of ice to accommodate increased user volumes and activities;

PSM PR-11.1.3  
Enclose/cover the existing outdoor tennis courts at SRC to meet increasing demands for indoor tennis facilities. At a minimum, improve the outdoor tennis facilities for safety and attractiveness;
PSM PR-11.1.4  Expand SRC to include indoor soccer programs and a full conditioning, weight training, and gymnasium complex;

PSM PR-11.1.5  Retain Spire Rock and pickleball, handball, racquetball, and basketball courts within the SRC complex;

PSM PR-11.1.6  Improve and expand support areas within SRC such as restrooms, hallways, locker rooms, and training rooms;

PSM PR-11.1.7  Improve the access to SRC by providing better connections to the surrounding neighborhoods and to Spanaway Park through sidewalks, pathways, and crossings;

PSM PR-11.1.8  Improve the parking lot landscaping, lighting, stormwater control, and signage at SRC; and

PSM PR-11.1.9  Conduct immediate actions for SRC facility, as outlined in the SRC Master Plan, to improve access and life safety.

PSM PR-11.2  Evaluate establishing a start-up location for a Boys and Girls Club at SRC.

PSM PR-11.2.1  The Boys and Girls Club should include a computer lab and programs.

PSM PR-11.3  Install a skateboard park at SRC.

PSM PR-11.4  Install outdoor covered basketball courts at SRC.

PSM PR-11.5  Update the Bresemann Forest management plan.

PSM PR-11.5.1  Address the trail system and the need for amenities.

PSM PR-11.5.2  Consider invasive plant removal.

PSM PR-11.5.3  Explore environmental education opportunities.

PSM PR-11.6  Develop an environmental education trail along Spanaway Park/Spanaway Creek regarding wetlands/riparian areas.

PSM PR-11.7  Provide a portable restroom facility near Bresemann Forest/Spire Rock.

PSM PR-11.8  Address the goose overpopulation problem in Spanaway Park.

PSM PR-11.9  Provide upgrades to existing community and neighborhood parks within the plan area.

PSM PR-11.9.1  Commence development of the Hope site as a future expansion of Gonyea Playfield.

PSM PR-11.9.2  Clean up the garbage at the Hope site and maintain site until development occurs.

PSM PR-11.9.3  Update the site plan for Dawson Playfield that at a minimum addresses drainage and the ball fields.

PSM PR-11.9.4  Re-establish and maintain the wading pool and resurface the existing tennis courts at Dawson Playfield.
PSM PR-11.10  Increase enforcement and safety within park and recreation facilities.

PSM PR-11.10.1  Continue bike and horseback patrols of the parks by the Pierce County Sheriff’s Department. Provide foot patrols in Bresemann Forest to deter people from lighting fires/camping and perpetrating vandalism around Spire Rock.

PSM PR-11.10.2  Increase enforcement of scoop/leash laws.

PSM PR-11.10.3  Provide plastic sacks in park areas for dog scoops.

PSM PR-11.11  Reclassify Gonyea Playfield to a neighborhood park.

PSM PR-11.12  Develop regional swimming pools within the plan area.

PSM PR-11.12.1  Consider putting a regional level swimming pool at one of the local high schools or at SRC.

PSM PR-11.12.2  Expand the public swimming opportunities at Pacific Lutheran University pool.

AGENCY COORDINATION

GOAL PSM PR-12  School fields should not be over-used by the community to the extent that they become damaged.

PSM PR-12.1  Community groups and recreation organizations should pay user fees to the school district that compensate for the costs associated with maintenance of school district facilities.

TRANSPORTATION POLICIES

NONMOTORIZED TRANSPORTATION

GOAL PSM T-1  Meet the needs of bicyclists, pedestrians, and equestrians traveling on roads in the County and encourage the provision of nonmotorized facilities, including sidewalks, where it is appropriate to provide safe and convenient access between properties and facilities.

PSM T-1.1  Separate nonmotorized facilities should be provided for incompatible modes in areas of intensive demand.

PSM T-1.2  Nonmotorized routes should be planned to avoid major arterial highways by following adjacent parallel rights-of-way where possible.

PSM T-1.3  Nonmotorized facilities that serve or provide access to recreation areas should not interfere with other recreation activities in the area.

PSM T-1.4  Freeway overpasses and underpasses should include safe and accessible sidewalks and paved shoulders for pedestrian and bicycle traffic.
Maps, signs, and directional markers should be incorporated in the nonmotorized transportation system.

**PUBLIC TRANSPORTATION AND COMMUTER TRIP REDUCTION**

**GOAL PSM T-2** Explore opportunities to increase transit service in the Parkland-Spanaway-Midland (PSM) communities such as:

- **PSM T-2.1** New east-west routes and higher frequency for all routes;
- **PSM T-2.2** Increase time range of service to continue running in the late evening;
- **PSM T-2.3** Provide and maintain transit restroom facilities;
- **PSM T-2.4** Utilize transit vans where cost efficient;
- **PSM T-2.5** Integrate school transit and public transit; and
- **PSM T-2.6** Extend rail service to the PSM communities and ensure that the commercial centers are connected to the regional rail service.

**SUSTAINABLE TRANSPORTATION**

**GOAL PSM T-3** Access on and off SR 512 should be limited to Steele Street, Pacific Avenue, Portland Avenue, and Canyon Road.

- **PSM T-3.1** State Route 7, Canyon Road, Portland Avenue, and Spanaway Loop Road should remain the only major north-south arterials.

**GOAL PSM T-4** Work with the Washington State Department of Transportation to achieve a balanced flow of traffic volume on SR 7.

**UTILITIES POLICIES**

**SEWER AND WASTEWATER TREATMENT**

**GOAL PSM U-1** Schedule construction activities to avoid sensitive time periods in the life cycle of fish and wildlife, such as spawning, nesting, and migration.

**GOAL PSM U-2** Design landscaping around sewerage facilities to reflect the area surrounding the facility or as otherwise provided in community plan design standards.

**GOAL PSM U-3** Implement or administer contamination protocols during construction of sewer utilities.

- **PSM U-3.1** Enforce spill containment practices.
- **PSM U-3.2** Service and fuel construction equipment outside of construction areas when practical.
- **PSM U-3.3** Remove and dispose of contaminated materials in appropriate locations.
PSM U-3.4 Adjust facility locations and alignments in the event that contaminated soils, groundwater, or buried wastes are identified during construction.

GOAL PSM U-4 Remove exotic invasive species such as Scot’s broom and Himalayan blackberry in conjunction with revegetation of disturbed areas.

GOAL PSM U-5 Design treatment/collection systems to minimize impacts on the natural environment and surrounding development.

PSM U-5.1 Consider the noise sensitivity of neighboring uses during the design of sewage facilities.

PSM U-5.2 Design housing for above ground pump stations to be harmonious with surrounding structures.

GOAL PSM U-6 Establish conservation measures that minimize the impacts of water usage associated with sewer utilities.

PSM U-6.1 Urge retention of plumbing code requirements for low-flow fixtures.

PSM U-6.2 Support cost-effective incentive programs for plumbing fixture and appliance replacement in service areas.

PSM U-6.3 Participate in public information and education programs on water conservation in service areas.

PSM U-6.4 Continue an aggressive infiltration and inflow control program.

PSM U-6.5 Continue an aggressive pretreatment program.

DOMESTIC WATER SYSTEMS

GOAL PSM U-7 Pierce County should pursue the needed changes in state legislation either to ensure that water rights needed to accommodate future growth can be obtained or that the Growth Management Act be amended to limit growth in the County so that additional water rights are not necessary.

GOAL PSM U-8 Pierce County should continue to develop the Pierce County Water Utility as a source of wholesale water for purveyors operating within Pierce County.

STORMWATER FACILITIES

GOAL PSM U-9 Enhance drainage facilities within the plan area.

PSM U-9.1 Adequately size stormwater pipe/culvert and retention/detention systems in new development to handle conveyance and storage/slowdown of surface water runoff and install in such a manner as not to impede or alter substantially the flow of existing water bodies.

PSM U-9.2 Acquire flood-prone properties (both public and private) within the plan area, such as B Street, 136th, and Tule Lake Road, for future stormwater detention areas.
PSM U-9.3 Identify all culvert and stormwater inlets that discharge directly into or that are tight-lined directly to wetlands, lakes, and riparian areas.

PSM U-9.3.1 Develop a program and timeline to retrofit any points of direct discharge and redirect this discharge into appropriate stormwater detention/retention or water quality facilities.

PSM U-9.3.2 In any new development, prohibit stormwater from being directly piped into surface water bodies (i.e., wetlands, streams, creeks, lakes).

PSM U-9.4 Explore the merger of the local drainage districts with Pierce County Surface Water Management.

PSM U-9.4.1 At a minimum, coordinate ditch maintenance and additional release of surface water runoff into existing ditches with applicable drainage districts.

PSM U-9.5 Create a new program to adopt a stormwater pond.

PSM U-9.5.1 Explore opportunities to utilize these ponds for educational activities.

PSM U-9.5.2 Encourage groups to provide enhancements to the natural environment in accordance with the plan.

PSM U-9.5.3 Establish volunteer monitoring of the ponds.

PSM U-9.5.4 Allow selected groups to place a sign on the site that indicates they are working in conformance with the adopted plan.

**Implementing Actions**

The following is a list of actions that need to be completed in order to implement the policies contained within this plan. They are arranged according to the timeframe within which each should be completed: short, medium, or long term. Short term actions should occur immediately or within one year of plan adoption. Mid-term actions should be completed within 2-5 years. Long term actions should be completed within 5-10 years of plan adoption. The party or parties responsible for leading the effort to complete the action item is listed in parenthesis following the action. Actions are assigned to the Parkland Area, Spanaway, and Midland Land Use Advisory Commissions (LUAC), Tacoma-Pierce County Health Department (TPCHD), Public Works & Utilities (PWU), Park & Recreation Services, Economic Development (ED), Pierce County Sheriff, or Pierce County Planning and Land Services (PALS).

**Short Term Actions**

**Domestic Water Systems**

1. Amend Title 16, Subdivisions and Platting to require that a certificate of water availability be provided prior to preliminary plat approval. (PALS)
2. Establish the Pierce County Water Utility to provide wholesale water to water purveyors operating within Pierce County. (PWU)
Stormwater Facilities

3. Provide additional County staffing resources to inventory, enforce the preservation of, and maintain private storm drainage systems. (PALS)

4. Coordinate watershed planning processes with basin and community planning processes. (PWU, PALS, TPCHD)

5. Amend the County Public Works and Utilities protocols to require the reconstruction of infrastructure that acts as a barrier to fish or any wildlife passage when any public road or utility project would affect or be affected by the blockage. (PWU)

Parks

6. Amend the Capital Facilities Element to address the current plan area deficits in regional parks and regional linear (major) trails. (Parks, PALS)

7. Amend Title 18A, Development Regulations-Zoning to: (PALS, Parks)
   - Establish a regulatory structure for mitigating local park and recreation impacts for new residential lots created or new residential structures on existing lots of record. This structure should be a multi-faceted approach comprised of park impact fees, land dedication, and fee-in-lieu-of land dedication.
   - Require a land dedication or fee-in-lieu-of land dedication for major and minor trails.
   - Require the installation of nonmotorized transportation trails that connect new developments to schools, parks, or adjacent development.
   - Require that pedestrian paths be installed to connect new residential development to dedicated mini-park facilities.
   - Require new Master Planned Communities to dedicate land for the development of community parks that are available to the general public.

8. Amend Title 18J, Development Regulations-Zoning to incorporate park and recreation design and location criteria. (PALS, Parks)

9. Amend the Pierce County Nonmotorized Transportation Plan to update with Proposed Trail System Map recommendations. (PWU)

10. Place conservation easements on all existing park sites that restrict future uses to park and recreation activities. (Parks)

11. Amend the Pierce County Code to require the proceeds from the sales of publicly owned park sites be used to purchase an equivalent or greater amount of land for park and recreation purposes. (Parks)

12. Conduct immediate actions for the SRC facility, as outlined in the SRC Master Plan, to improve access and life safety. (Parks)

13. Enter into negotiations with Fire Protection District No. 6 regarding the status of the satellite fire station and the potential reacquisition of the district’s .60-acre parcel. (Parks)

14. Clean up the garbage at the Hope site and maintain cleanup until development. (Parks)

15. Reclassify Gonyea Playfield from a community to a neighborhood park. (Parks)

16. Increase Deputy Sheriff patrols in Bresemann Forest. (Sheriff’s Department)

17. Provide plastic sacks in park areas for dog scoops. (Parks)
Transportation

18. Revise the development standards in the County Code and the Site Development Manual to require developments to provide direct, convenient, and safe easements, roadway, path, and trail connections between adjacent existing or future neighborhoods, schools, shopping areas, recreation areas and trails, transit facilities, and other activity centers. (PWU, PALS)

19. Expand the Development Review Process to ensure:
   - The provision of adequate nonmotorized facilities connecting parks, playgrounds, open space areas, schools, residential and commercial areas, entertainment facilities, churches, and other centers;
   - Consolidation of driveway accesses as stated in the Pierce County Manual on Design Guidelines and Specifications. (PWU)

20. Continue internal Public Works and Utilities review process for adequate nonmotorized facilities in all new road construction, including:
   - Separating pedestrian walkways from roads with buffers in high use areas;
   - Providing nonmotorized facilities that meet the most recent standards to serve people of all physical abilities. (PWU)

21. Revise development standards in centers to:
   - Locate structures and orient entrances to the transportation network (i.e. sidewalks and transit stops);
   - Minimize the construction of excessive parking stalls and locate off-street parking behind developments to allow direct nonmotorized access to structures without traveling through large parking areas;
   - Consider the use of wide sidewalks in centers to allow for higher-intensity use, rest areas, and other amenities. (PALS)

22. Coordinate efforts by Pierce County, local jurisdictions, the Washington State Department of Transportation, the State legislature, and the private sector to increase State and federal funding for transportation. This could include increases in the gas tax or other existing transportation funding sources, or the creation of new sources such as a sales tax on gasoline, or street utilities for capital improvements.

23. Program recommended transportation projects in the Pierce County Capital Facilities Element and Transportation Improvement Program. (PWU)

24. Continue to follow the Pierce County Stormwater Management and Site Development Manual until adoption of the State Design Manual. Pursue local or State revisions to the manual to require the maximum restoration possible of pre-existing vegetation. (PWU)

25. Review the Fish and Wildlife Critical Areas Ordinance to determine if the white oak protection clauses need to be revised to protect the trees from future road and building development. (PWU, PALS)

26. Revise the Pierce County Comprehensive Plan transportation project listing to be consistent with the Parkland-Spanaway-Midland Communities Plan transportation project list. (PWU)
MID-TERM ACTIONS

Sewer and Wastewater Treatment

1. Participate with water purveyors in a water conservation program that encourages the reduction of water usage associated with sewer utilities. (PWU)

Domestic Water Systems

2. Propose changes to state laws that would allow the movement of water between water systems. (PWU)
3. Amend the Coordinated Water System Plan (CWSP) to revise water service boundaries where the designated water service provider cannot provide timely or reasonable service. (PWU)

Law Enforcement

4. Amend the Capital Facilities Plan to adopt a level of service, based on the number of on-duty commissioned officers in the community, which would more accurately reflect the true level of service in the community. (PALS, PC Sheriff, PC Council)

School District

5. Work with the Franklin Pierce and Bethel School Districts to determine if impact fees for schools are adequate to mitigate the impacts to the facilities that are generated by new residential growth within the communities plan area. Amend the school impact fee ordinance if necessary. (PALS, PC Council, PAC)
6. Develop a program annually consult with the Franklin Pierce and Bethel School Districts to prioritize safety improvements near schools and established bus stops. (PALS, PWU, Franklin Pierce School District, Bethel School District)

Stormwater Facilities

7. Establish administrative guidelines for location and plantings of stormwater detention and retention facilities. (PWU)
8. Develop and implement a program to identify all culverts and stormwater inlets that discharge directly into or that are tight-lined directly to wetlands, lakes, rivers, and streams. (PWU)

Parks

9. Evaluate the financial performance of SRC. Consider increasing the fee structure for the use of ballfields as a method to help defray the costs of operating and maintaining league play. (County Council, Parks)
10. Reprioritize expenditures of general funds to acquire, operate, and maintain a system of local parks. (County Council, Parks)
11. Complete development of the park portion of the Hope site. Develop in a manner that serves as an extension of Gonyea Playfield. (Parks)
12. Amend the Capital Facilities Element to address the projected plan area deficits in regional parks and regional linear (major) trails. (Parks, PALS)
13. Commence technical support for creating a Park Service Area to serve the plan area with the development and maintenance of community and neighborhood level park and recreation facilities. (Parks)
14. Pursue sponsorship opportunities at SRC. (Parks)
15. Complete the development of segments of the major trail system within the plan area. At a minimum, acquire the property necessary to meet the established LOS for these types of facilities. (Parks)
16. Complete the following recommended upgrades to SRC facility: (Parks)
   - Enclose/cover the existing outdoor tennis courts.
   - Expand current recreation programs to include indoor soccer programs and a full conditioning, weight training, and gymnasium complex.
   - Improve and expand support areas (restrooms, locker rooms, etc.).
   - Improve pedestrian access.
   - Improve parking lot landscaping, stormwater control, lighting, and signage.
   - Address the trail system in Bresemann Forest and the need for amenities.
   - Install a skateboard park.
   - Install outdoor covered basketball courts.
   - Provide portable restroom facilities near Bresemann Forest/Spire Rock.
17. Address the goose overpopulation problem in Spanaway Park. (Parks)
18. Develop an environmental education trail along Spanaway Park/Spanaway Creek. (Parks)
19. Conduct an analysis of whether expanding the ice rink facilities at SRC would be feasible. (Parks)
20. Evaluate the feasibility of establishing a Boys and Girls Club and programs at SRC. (Parks)
21. Update the Dawson Playfield site plan. (Parks, Metro Parks)
22. Reestablish and maintain the wading pool and resurface the existing tennis courts at Dawson Playfield. (Parks, Metro Parks)
23. Increase enforcement of scoop/leash laws. (Parks)
24. Enter into negotiations with Pacific Lutheran University to increase the public swimming opportunities. (Parks)
25. Enter into negotiations with the local school districts to establish cooperative agreements for joint use of facilities. (Parks)

**Transportation**

26. Review Washington State Department of Transportation (WSDOT) policy documents, design standards, and proposed projects to ensure that freeway overpasses and underpasses include safe and accessible sidewalks and paved shoulders. (PWU)
27. Examine street-lighting policies and technologies to reduce light pollution. Lighting fixtures or policies may be able to reduce undesirable light in areas off of the transportation system. (PWU and Utility Providers)
28. Develop a neighborhood speed control program by:
• Approving a budget to develop and implement the program;
• Hiring staff to produce administrative procedures to evaluate and prioritize options for interested neighborhoods;
• Beginning the program by requesting applications from communities and neighborhoods. (PWU)

29. Develop an umbrella agreement with Pierce Transit to identify standards and conditions for transit facilities in public rights-of-way. In addition, develop an agreement between the agencies governing financial cooperation in the provision of roadway/transit facilities such as:

• Widened bus stops,
• Lighting,
• Litter receptacles,
• Shelters,
• Street furniture, and
• Bicycle racks. (PWU, Pierce Transit)

30. Continue to cooperate with Pierce Transit in applying for grant funding for facilities and providing data to ensure operational efficiency. (PWU, Pierce Transit)

31. Revise the Manual on Design Guidelines and Specifications for Road and Bridge Construction in Pierce County to require criteria for the location and determination of drainage grates used in new roadway construction and reconstruction to mitigate impacts to bicycles and wheelchairs. (PWU, PALS)

32. Pierce County will explore and develop a transportation impact fee program. (PWU)

LONG TERM ACTIONS (5-10 YEARS)

Domestic Water Systems

1. Develop a regional supply network, such as transmission lines, source facilities, storage and other facilities, for domestic water. (PWU, Water Purveyors)

Stormwater Facilities

2. Establish an “Adopt a Stormwater Pond” program and develop management plans for pond maintenance. (PWU)

Parks

3. Hire a volunteer coordinator/environmental educator. (Parks)
4. Develop a public regional swimming pool within the plan area. (Parks)
5. Complete and adopt development site plans for all regional facilities within the plan area. (Parks)
Transportation

6. Update maps and add signs and directional markers as the nonmotorized transportation network develops and destinations are connected. (PWU, Parks, Neighboring Jurisdictions, Private Sector)

Parkland-Spanaway-Midland Communities Plan Boundary

Department of Planning and Land Services
Plot Date: September 11, 2006
Chapter 7: Plan Monitoring

Purpose

The 1990 State Growth Management Act (GMA) requires jurisdictions planning under GMA to report on progress made in implementing the Act, and to subject their comprehensive plans to continuing evaluation and review. As part of the County’s Comprehensive Plan, the Parkland-Spanaway-Midland Communities Plan is subject to this requirement. One mechanism for conducting this evaluation and review is to monitor the development standards, regulations, actions, and other programs called for in the plan for the purpose of determining their effectiveness in fulfilling the vision of each of the five elements of the plan.

This chapter provides a framework both for monitoring the various actions undertaken to implement the plan and for offering recommendations to make adjustments to the actions in order to better fulfill each of the visions in the plan. Actions may include the development and implementation of regulations and design standards, working with various governmental agencies to develop programs, organizing community groups and events, developing interpretive and educational programs, conducting community forums, and other actions. This framework provides a means for measuring the effect of each action, identifies participants and their roles in monitoring the actions, lays out time frames for monitoring, and specifies how the monitoring program should be documented. Information obtained from the monitoring program will be used to offer recommendations to decision makers as to what changes to the communities plan may be needed in order to attain specified goals and meet the visions in the plan.

How to Measure the Effect of Standards

The Parkland-Spanaway-Midland Communities Plan identifies actions which need to be implemented to meet its visions, goals, and objectives. Monitoring evaluates the effectiveness of the actions in fulfilling these visions, goals, and objectives. The monitoring program outlined here includes several steps which are intended to identify actions taken, the ease with which they can be used, and whether the actions actually fulfill the objectives they were intended to fulfill.

To do this, the monitoring program is divided into five steps: Actions, Inputs, Process, Outputs, and Outcomes. Each of the steps and the responsible participant are discussed briefly here.

Phase 1: Actions.

Phase 1 monitoring would consist largely of reviewing the visions, objectives, policies, and actions stated in the plan and identifying all the actions which need to be undertaken to be consistent with the plan. The actions should be grouped according to the objectives they are intended to meet. PALS staff and the Parkland Area, Spanaway, and Midland Advisory
Commissions (PAAC, SAC, and MAC) would be the primary participants in this activity. A report from PALS would be submitted to PAAC, SAC, and MAC for review.

**PHASE 2: INPUTS:**

Phase 2 monitoring would determine whether actions called for in the plan have actually been undertaken and completed. PALS staff would evaluate if regulations and design standards have been adopted. Review to determine if other actions, such as community forums or other events, have been completed could be done by PAAC, SAC, MAC, PALS staff, and event organizers.

**PHASE 3: PROCESS:**

Phase 3 monitoring would evaluate whether an action is straightforward, understandable, or easy to use. In the case of regulations and design standards, those persons who have submitted permit applications requiring compliance with these regulations and design standards would need to be involved in the evaluation. Citizen advisory boards which review such applications, as well as PALS staff, would also be included in the monitoring. PALS staff would coordinate the monitoring and could conduct interviews or distribute questionnaires to persons who have submitted or reviewed permit applications subject to the regulation being monitored. Monitoring of other actions, such as events and ongoing activities, would include event organizers and participants, PAAC, SAC, MAC, and PALS staff.

**PHASE 4: OUTPUTS:**

Phase 4 monitoring would determine whether the action has been carried out as stated in the plan. For example, monitoring would determine whether a regulation or design standard has been complied with and identify reasons for any noncompliance. In regard to events and ongoing activities, monitoring would determine whether the immediate objectives of the activity have been met. Participants would include residents, property owners, the PAAC, SAC, MAC, and PALS staff.

**PHASE 5: OUTCOMES:**

Phase 5 monitoring would evaluate the extent to which each action results in the desired effect on the community. The primary participants are the residents and property owners in the plan area. Assistance would be provided by the PAAC, SAC, MAC, and PALS staff. The PAAC, SAC, and MAC would need to provide a forum in which adopted vision statements are reiterated to residents and property owners. PALS staff would assist in organizing public meetings, preparing and distributing questionnaires, and using other means to gather information.
It is anticipated that the Parkland-Spanaway-Midland Communities Plan will take a substantial period of time to be implemented. There are a number of actions that can be accomplished within a short timeframe, some will take much longer, and others will involve ongoing actions with no specific completion date. It is important that monitoring be done on a continuing basis with specific actions monitored at different times.

In regard to monitoring the development and implementation of regulations and design standards, it would be appropriate for monitoring to be phased over time as the five phases outlined above are accomplished. Phase 1 would begin almost immediately upon the plan adoption. Phase 2 would take place within two years following the plan adoption. This would provide adequate time for the County Council to adopt implementing regulations called for in the plan. Phases 3, 4, and 5 would occur within two to three years following completion of Phase 2. This would allow time for the regulations to be applied to a number of development projects. Phase 3 analysis of how understandable the regulations are and the ease to which they can be applied would then be based on the application of the regulations to those projects developed within that time period. Phases 4 and 5 monitoring would be done simultaneously with Phase 3 monitoring. The total time for initial monitoring for Phases 1 through 5 would be about five years. As changes are made to regulations and design standards, the monitoring cycle would need to be repeated to address the changes.

Other actions which do not involve the implementation of regulations or design standards would be monitored on a similar timetable. Phase 1 and Phase 2 would occur within two years of adoption of the plan, while Phase 3, 4, and 5 monitoring would occur within five years of plan adoption.

As amendments are made to the plan, monitoring would need to continue to determine how effective the changes are in carrying out the visions in the plan. In addition, it would be appropriate to continue monitoring all actions in the plan every five years to evaluate whether the actions continue over time to effectively carry out those visions.

A review of baseline information is necessary to effectively monitor whether the objectives of the Parkland-Spanaway-Midland Communities Plan are being met. Information regarding community attitudes, visual characteristics of the community, community services, infrastructure, business climate, land uses, permitting activity, and other community characteristics would be evaluated. The plan and other documents provide much of the baseline information. It may be necessary, however, to supplement that information prior to effectively monitoring the plan.

As each phase of monitoring is completed, a report should be prepared by PALS staff which identifies the action being monitored, the specific purpose of the monitoring, methods used in monitoring, data collected, analysis of the data, findings, and recommendations for further
action. The report should be submitted to the PAAC, SAC, and MAC for review and comment and to the County Council for its consideration.

**RECOMMENDATIONS FOR FURTHER ACTION**

In addition to determining the effectiveness of the plan in fulfilling the vision of the Parkland, Spanaway, and Midland communities, a key component to monitoring would be the recommendations for further action. These recommendations should clearly identify the specific vision statement being addressed, how the recommended action corrects a deficiency in the plan, how the recommended action will contribute to fulfilling the vision statement, and a timeline for completing the proposed action.
Appendix J: South Hill Community Plan

The South Hill Community Plan’s narrative text and policies are in addition to the Countywide Comprehensive Plan narrative text and policies and are only applicable within the South Hill Community Plan Boundary.

- “Current” or “Existing” conditions are in reference to conditions at time of adoption (Adopted Ord. 2003-11s, Effective 6/16/2003).
- “Proposed” or “Desired” conditions are those which required Council action and may have also been amended over time through a Comprehensive Plan Amendment (amendments are reflected in this document).

Chapter 1: Introduction

Overview of the Plan Area

South Hill is centrally located in Pierce County and encompasses approximately 19 square miles. The community is known as South Hill or ‘the Hill’ due to its location south of the valley containing the City of Puyallup and west of the valley containing the City of Orting. While the eastern boundary is defined by the Orting Valley and the northern boundary by Puyallup’s urban growth area, the western boundary generally follows 70th Avenue and the southern boundary 176th Street East. The community is bisected by SR 161, which is also known as Meridian Avenue East.

South Hill has experienced a tremendous amount of growth in the past 30 years. The growth in population, homes, businesses, and activities has simultaneously resulted in the loss of trees, wildlife, open spaces, and the general peace and quiet of a rural setting. It is an area that has been transformed from a rural setting into a suburban community that, in 1998, initiated a movement for incorporation. The incorporation proposal was defeated 2 to 1. However, the issues that drove the incorporation movement remain in the community. The South Hill Community Plan attempts to define how Pierce County will manage and address impacts of a rapidly expanding population while retaining the attributes that make South Hill unique.

History of South Hill

Early History through the 1900’s

Native Americans utilized the area, evidenced by the Ancient Klickitat Trail or Cowlitz Trail that connects eastern Washington with the areas west of the mountains. This trail passed through the community somewhere along Old Military Road. Native Americans who used this trail included the Puyallup, Steilacoom, Nisqually, and Muckleshoot peoples from the west side of the mountains, as well as the Yakima from the east of the mountains. The trail was utilized for hundreds of years by Native Americans to engage in trade, pursuit of game, travel, and communication.

When Euro-Americans were exploring and establishing trading posts and forts in the 1840’s, the Naches Pass Trail was shared by Euro-Americans and Native Americans in the movement of people, as well as horses and cattle. The Naches Pass Trail was utilized by one of the first wagon
train immigrants (Naches Pass immigrant group or Longmire Party of 1853) in order to take a short cut from the Oregon Trail to the Puget Sound area over the Cascades Mountains. In the 1850’s, Euro-American pioneers began to push for development of the Naches Pass Trail as an inland road connecting Fort Steilacoom and Puget Sound to Fort Walla Walla on the eastern side of the Cascade Mountains for settlement and commerce. Later, Snoqualmie Pass was favored over Naches Pass as the main movement corridor for military and commercial purposes and for future plans for a railroad route. Consequently, the Naches Pass Road remained in primitive conditions. In the meantime, the Naches Pass Road continued to be used by wagon train immigrants who settled in the Puget Sound area and by cattlemen who brought their animal stock from the east side of the mountains to markets in Puget Sound.

From the 1860’s through the 1880’s, the road was repaired and maintained through cattlemen's efforts and governmental funding, including Pierce and Thurston Counties and Olympia. In the 1870’s, the Naches Pass Road was called Upper Puyallup to Steilacoom County Road. Only segments of this historic road remain in the area, including Snoqualmie National Forest and South Hill. A portion of the original Naches Pass Road was incorporated into the present-day Old Military Road. The original Naches Pass Road was one of the earliest roads in the State of Washington. Recently, seven plaques have been placed in South Hill at various locations along the original Naches Pass Road and Old Military Road to commemorate the significant history of this early road.

Although there were some donation land claimants in the vicinity in the 1850’s, there was none inside the South Hill Community Plan area. But by the 1860’s and 1870’s, a few settlements of homesteads appeared in the South Hill community. The community was still largely forested, except those areas cleared by Euro-American settlers. Most settlers in the community engaged in the logging trade and agriculture. In addition to working in the hops industry, they also engaged in subsistence farming on their own lands.

Three Euro-American settlers’ properties are shown in the 1872 survey map of the South Hill area. They were William Woiderhold (Section 8, Township 19N, Range 4E), Charles Miller (Section 16, Township 19N, Range 4E), and Anton Drumblar (Section 16, Township 19N, Range 4E). It is speculated that the total population living in South Hill was under fifty in the late 1860’s through the early 1870’s. By contrast, more people settled in Puyallup which was platted in 1877. The population of Puyallup was 750 in 1878.

Hops became a very popular cash crop in the Puyallup Valley starting in the 1870’s through the 1880’s. Around this period, some in the South Hill community began to cultivate hops as well. Others engaged in diversified farming including pigs, rabbits, berries, dairy, and vegetables. Hops cultivation began to decline due to devastation from an epidemic of plant lice in 1891. A diverse berry crop replaced hops after the turn of the century and included strawberries, raspberries, and blueberries.

In the 1870’s, the arrival of railroads to Tacoma and the spur lines extending to the outer communities benefited the area greatly. The discovery of coal deposits in Wilkeson drove construction of lines for the Northern Pacific Railroad; the railroad transported agricultural products, logs and other timber products, and coal products. The railroad reached Puyallup around 1880, and by the 1920’s, it was served by several railroads--the Northern Pacific; Great
Northern; Union Pacific; the Chicago, Milwaukee, and St. Paul; the Interurban Rail; and a short line to Tacoma. These provided the area’s farmers with a vital transport link to local and world markets for their produce of hops, berries, and daffodils throughout subsequent decades. Railroad spur lines came through the South Hill community, including the areas near the present day Hidden Valley and the area of 120th Avenue and 120th Street of the then Brew Logging Company's land to transport timber resources. No track remains exist in South Hill.

By the late 1880’s, the population in South Hill increased to a level where it was necessary for the local people to request development of roads. In 1888, approximately 90 property owners in South Hill petitioned the Pierce County Board of Commissioners for the development of the street which became known as Meridian Avenue. Among the petitioners was Carl Muhler who cultivated hops on his farm. Behind road development petitions was the need to transport the hops crop to the market more easily. During this period, it is speculated the total population in South Hill was between 300 and 400 people.

The first independent school district in South Hill was established in 1895 near 136th Street E. and Meridian. Firgrove School, originally Patzner School, began on 2.5 acres purchased from the Northern Pacific Railroad for $25. Like many one-room schools of the time, it accommodated children in grades 1 through 8. The school joined the Puyallup School District in June 1950 as the seventh elementary school in the district. Presently, enrollment at Firgrove tops 550 students. Woodland and Puyallup Heights Schools were also early schools that served the community, but they are now located outside of the South Hill community. Public schools continue to serve as centers for community life.

Although its actual age has not been determined, a historic log cabin on Blyton Farm, at 152nd Street and 78th Ave. E., appears to be more than 100 years old. If it is, the cabin would be one of the oldest intact structures in South Hill.

**The Early 1900’s through the Early 1950’s**

South Hill remained rural throughout the early 1900’s to the early 1950’s. There were scattered residents on farms or wooded lots. Timber operations by companies such as Weyerhaeuser or individual timber land owners were carried out in South Hill. A variety of income-supplementing farms in the community included rabbits, chickens, mink, dairy, vegetables, and holly trees.

Meridian Avenue was the main access road to reach Puyallup, Graham, and Eatonville. Until the 1940’s, Meridian Avenue was a "farm-to-market" road. It was paved in the northbound direction in order to minimize the damage to the farmers' produce while transporting it to the market. The southbound road was an eight-foot-wide lane of gravel and mud that went to Eatonville.

McMillan Reservoir was built in South Hill in the early 1910’s. It was a municipal water storage facility for the City of Tacoma. It stores water from the White River to be transported through two underground aqueducts in South Hill to Tacoma to be utilized as part of the City's water supply.
Bonneville Electric Power transmission lines were constructed to run diagonally across South Hill in the 1940’s, as was a natural gas pipeline.

The Summit-Woodland-Collins Fire Department, the first fire district (Pierce County Fire District #9) in South Hill, was formed in 1948. At the beginning, it was staffed by 18 volunteer firefighters and was located at Airport Way (present-day 112th St.) and Canyon Road.

Many old timers in South Hill and the surrounding community fondly remember Willows Corner located at Meridian Avenue and 112th Street. It was originally the Kupfer Homestead of more than 240 acres. In the 1920’s, the intersection of 112th and Meridian had a gas station and grocery stores and became the community’s commercial center. The Willows Dance Hall was added later near one of the grocery stores. The dance hall was a popular place in the prohibition era of the 1930’s and drew couples from all over the Pierce County area. It was called a destination resort in some advertisements. The dance hall later burned to the ground.

In 1973, Willows Shopping Center was built at Willows Corner, followed by the South Hill Shopping Center. Now, the old Willows Corner is a part of the City of Puyallup.

In 1944, several businessmen from Puyallup purchased approximately 250 acres of an old logging camp located northeast of the present-day Frederickson community and immediately east of Meridian (SR 161), and established an airport with a 4,700 foot runway. At that time, it was the longest non-military airstrip in the area. In 1949, John Thun purchased the airport and began to operate a flying instruction business from the airport. With the additional purchase of land, the airport expanded to nearly 500 acres in 1967. Eventually after two additional ownership changes, approximately 150 acres of area including the airport and surrounding area were sold to Pierce County in 1979 and renamed Pierce County Airport-Thun Field. The airport is still owned and operated by Pierce County.

In 1948, the community was still relatively small, considering the fact that less than one bus load of senior high school students from South Hill went to Puyallup High School.

The community grew during this period as more people moved further south, densifying the area from the Puyallup vicinity toward Graham and Orting. Farms were subdivided to make way for residential developments. More roads were developed in the area meeting local community needs.

**THE LATE 1950’S THROUGH THE EARLY 1970’S**

South Hill's population began to increase dramatically with the beginning of the development of SR 512 in 1956 and its completion in 1972. This east-west connection made travel relatively easy from residential locations in South Hill to major employment and commercial centers on I-5, SR 7 (Pacific Avenue), and SR 161 (Meridian Avenue). It provided the community with crucial connections to urban centers in nearly every direction. South Hill, as a suburban bedroom community, began to take shape in earnest during this period.

Approximately 7,000 people are estimated to have lived in South Hill in the early 1970’s. Major real estate speculation and boom began during this period. Many individuals with properties would short plat their properties taking advantage of the rapid appreciation of land prices.
Large tracts of land began to be purchased by real estate interests to be developed into residential and commercial developments.

**The Mid-1970’s through the 1990’s**

Development activities in South Hill accelerated during the mid 1970’s through the 1990’s. The main thoroughfare of Meridian (SR 161) became intensely developed as a continuous strip of commercial developments. South Hill Mall, as a regional shopping center, opened in the 1980’s, drawing customers from all over the Puget Sound region.

In the late 1970’s, the growth rate of South Hill equaled or exceeded those in major urbanized areas such as University Place, Lakewood, and Gig Harbor. Some of the major impacts from fast growth were evidenced in the traffic congestion on Meridian Avenue and severe drainage problems in pockets of South Hill from runoff in the surrounding developments. It was not unusual for developers to subdivide large tracts of land into hundreds or thousands of residential lots.

Puyallup Raceway Park near Thun Field was closed down partly due to community opposition protesting the noise and other impacts from the auto race track.

Major subdivisions or planned developments such as Gem Heights and Rainier Terrace, later renamed to Sunrise, came into existence during the 1980’s. The Gem Heights development included approximately 2,000 housing units; the Sunrise development included approximately 4,200 residential dwelling units in its build-out scenario, and has been proceeding in phases. At the completion of Sunrise, the residents projected to live in the development would comprise more than 30% of the population growth of 10,260 households projected for the South Hill census tract. Overall, residential developments intensified near the commercial strips and further out in South Hill, bringing the population to approximately 20,000 by the end of the 1980’s.

The annexation issue came to a head in the early 1980’s to address infrastructure improvements including sewers, water, roads, surface water drainage, and police protection. Ultimately, the commercial strip along Meridian and the area south of 39th Avenue SW were annexed into the City of Puyallup. At times, the residents surrounding the commercial area opposed annexation and remained in Pierce County, fearing higher taxes, requirements to hook up to sewers, higher utility costs, and duplication of government.

The community is currently attempting to address the long-standing central issue of how to manage impacts from rapid growth through planning efforts mandated by the Washington State Growth Management Act. The population in the South Hill community is now estimated at approximately 35,000 people.
Pierce County Comprehensive Plan | South Hill Community Plan

**PLANNING HISTORY**

**COUNTY PLANNING**

**1962 PIERCE COUNTY COMPREHENSIVE PLAN AND ZONING**

The first Pierce County Comprehensive Land Use Plan and the Pierce County Zoning Code were adopted in 1962. Zoning districts were established that dictated the appropriate location for commercial business and residential homes. However, the Plan did not offer much protection from incompatible uses and did not recognize the unique individuality of communities.

In 1992, some areas of South Hill were rezoned from General to the Suburban Agriculture zone (Ordinance 90-123S). The Suburban Agriculture zone was more restrictive than the General zone.

**1994 PIERCE COUNTY COMPREHENSIVE PLAN**

The Growth Management Act (GMA) was passed by the Washington State Legislature in 1990. It required Pierce County to update its existing Comprehensive Plan and Development Regulations in a manner that would control residential, commercial, and industrial growth.

In 1991, Interim Growth Management Policies were adopted as a transition between the 1962 Comprehensive Plan and the more complex plan developed under the Growth Management Act. In 1992, the County-Wide Planning Policies were adopted. The policies provided the framework and process by which Pierce County and the cities and towns within the County would establish urban growth areas, provide infrastructure and services, and preserve agricultural and natural resource lands.

In 1994, Pierce County adopted the 1994 Pierce County Comprehensive Plan which replaced the 1962 Pierce County Comprehensive Plan in its entirety. The Plan established population projections, urban growth areas, and rural areas. The implementing Development Regulations-Zoning became effective in July 1995.

**COMMUNITY PLANNING**

The Community Plans Element of the 1994 Pierce County Comprehensive Plan envisions a local voice in how the Comprehensive Plan and its Development Regulations will be carried out in communities. It indicates specific land use designations, appropriate densities, and the design standards that should apply in community planning areas. Preserving and building community character while ensuring an efficient and predictable development approval process is a central theme.

Although the Growth Management Act does not require comprehensive plans to provide for community plans, Pierce County Ordinance 90-47S directs County officials to prepare a community plans element of the Comprehensive Plan. The majority of unincorporated County
population reside in community plan areas. Community plans must be consistent with the Comprehensive Plan and the GMA.

**SCOPE OF THE COMMUNITY PLAN**

**LEGISLATIVE AUTHORITY TO DEVELOP THE PLAN**

In the Community Plans Element of the 1994 Pierce County Comprehensive Plan, South Hill was identified as a community that would receive a community plan. In August 1999, the Pierce County Council directed the Department of Planning and Land Services to initiate a community plan for the South Hill community through Resolution R99-66S. The process for developing the South Hill Community Plan began with the formation of a Community Planning Board. The Board was comprised of business owners, residents, and organizations consisting of a broad range of interests. The County Council modified the boundaries of the South Hill Community Plan with Ordinance 2001-21s. The modification excluded Canyon Road and the area known as Summit View and ensured all of the Sunrise development was included in the plan.

**PURPOSE AND USE OF THE COMMUNITY PLAN**

The South Hill Community Plan gives residents, businesses, property owners, and Pierce County a clearer, more detailed sense of how the community wants future growth and development to occur. It details what standards should be utilized in order to create and maintain the character and amenities identified through the policies and goals of the plan. The South Hill Community Plan accomplishes the following:

- Sets distinct goals and visions for the South Hill community;
- Provides design standards for architecture, site layout, signs, and landscaping to all development;
- Provides tree retention or replacement standards to ensure significant vegetation is provided for each site;
- Establishes recreation standards to ensure a recreation is provided for every new residential development and that the recreation area is not just a small tot lot;
- Requires pedestrian connections through commercial and residential areas so that citizens may travel on foot or bicycle to any destination within the community; and,
- Identifies implementation actions necessary to carry the plan to full completion over the course of the next 20 years.

**COMPONENTS OF THE COMMUNITY PLAN**

The vision statements and all of the policies (goals, objectives, principles, and standards) were developed through citizen input. When applying the policy statements, each should be afforded equal weight and consideration.
VISIONING PROCESS AND VISION STATEMENTS

Visioning is typically completed through a series of public meetings or workshops structured to allow the community to articulate hopes for the future. Statements, thoughts, and ideas brought forth in the visioning process became the basis for the visions, goals, objectives, and principles of the community plan.

A vision is a statement of hope within the best of circumstances. It is placed on the horizon of the future, provides direction, and is a reflection of who and what the community is and what it wants to become. Visions stay on the horizon and are larger than life, providing a beacon in the future toward which the community can steer. As soon as progress is made toward this vision, it is again moved out to the horizon. Visions are meant to be compelling and exciting, and embody a degree of risk taking and venture into the unknown.

Vision statements can be either: 1) broad - painting a picture of what the community should strive to be like, physically and socially; or 2) focused - to express how the concerns, values, and hopes of the community should be reflected in various topics.

GOALS

Goals describe a desirable future for the community: identifying who, what, why, and how the broad values and hopes set forth in the vision statement will be accomplished. Goals provide the framework from which objectives, policies (principles and standards), implementation actions, and recommendations will be developed.

OBJECTIVES

Objectives are statements which specifically define goal actions.

PRINCIPLES AND STANDARDS

Principles set a particular course of action to accomplish objectives. Standards, quantitative or qualitative, are specific benchmarks or targets to be accomplished in the ongoing development of the community.

IMPLEMENTATION ACTIONS

Implementation actions and recommendations are refinements and changes to policy documents, regulations, capital facility plans, and statements directing agencies and community groups to revise or develop plans, regulations, programs, and other non-regulatory measures.

CONSISTENCY WITH THE 1994 PIERCE COUNTY COMPREHENSIVE PLAN

The goals, objectives, policies, and standards in the South Hill Community Plan are consistent with the provisions in the Pierce County Comprehensive Plan. The plan proposes one new zone classification to implement the Community Center designation.
Development of the recommended plan incorporated a variety of public involvement strategies including the formation of Community Planning Boards and committees, public workshops and open houses, and various surveys. These public involvement techniques ensure that the plan is developed as a representation of the general will and values of the community.

Community Planning Board

The development of the South Hill Community Plan could not have been accomplished without the South Hill Community Planning Board (CPB). The CPB, appointed in the spring of 2000, consisted of a 13-member group representing a variety of interests and geographic locations in the community. In early 2001, the Board was increased to 16 members in order to fill vacancies and provide more community representation.

The CPB was charged with the following responsibilities: 1) serving as a sounding board for the community; 2) developing a vision and goals for the community plan area; 3) guiding the development of policies and map changes that address community concerns while remaining consistent with the Comprehensive Plan; and 4) forwarding a South Hill Community Plan to the Pierce County Planning Commission and Pierce County Council.

Open Houses and Workshops

Visioning Open Houses

Two open houses were held in February 2001 to present the efforts of the planning board and the draft vision statements to the public. The planning board gathered comments on the overall vision for the community and visions for each element of the plan. The planning board presented the South Hill Community Plan Visioning Map encompassing many of the goals and vision statements. Those in attendance were supportive of the draft vision statements.

The planning board also presented three distinct concepts, or alternatives, for future land use patterns. Alternative 1 continued the existing land use pattern where commercial uses are located along Meridian and the remainder of South Hill is residential (see Map J-2: Land Use Working Map Alternative #1). The residential housing choices would be similar to the housing choices of today. Alternative 2 is similar to Alternative 1, but adds higher density housing adjacent to the Meridian corridor (see Map J-3: Land Use Working Map Alternative #2).

Alternative 3 attempts to restructure Meridian Avenue by encouraging commercial uses to locate into distinct centers (see Map J-4: Land Use Working Map Alternative #3). Each center would serve a distinct purpose or market and contain design standards consistent with the goals of that center. One of the goals of this alternative was to redesign Meridian Avenue away from a continuous strip of commercial uses. Alternative 3 also places some small scale, limited commercial uses into residential neighborhoods – with very strict design standards and limits on uses as well as hours of operation. Neighborhood commercial is intended to offer residents...
choices for accessing daily goods and services, such as a cup of espresso or an ice cream cone, without having to travel Meridian.

Alternative 3 also offers a variety of housing types and densities. This alternative recognizes that some residents choose to live on large lots while others choose to live on smaller lots with higher density housing. The location of the various types of housing is dependent upon environmental constraints as well as the availability of necessary infrastructure.

Alternative 3 is representative of the final decisions of the Community Planning Board. However, the final board recommendation allows the continuance of commercial uses along Meridian Avenue.

**Policy Open Houses**

Four open houses were held in June 2002 to present draft policies to the public for comment. The CPB distributed surveys on parks, neighborhood commercial uses, and a central place for the South Hill community. Over 250 residents attended the four open houses. The comments and survey results guided the CPB in making policy changes to the plan.

**Transportation Workshop**

Approximately 200 residents met in July 2002 to discuss traffic congestion and north/south roadway extensions in the South Hill area. Recommendations from this workshop guided the development of transportation policies in the plan.

**Survey**

In November of 2000, Pierce County Planning and Land Services (PALS) and the South Hill Community Planning Board developed a questionnaire to survey the community. The results identified the needs and desires of the local residents to more clearly define plan goals and strengthen the effectiveness of the plan. It was randomly distributed to 3,172 households within the community plan boundaries. Questions were related to the environment, economy, design standards, public facilities and services, land use, interim regulations, and household characteristics. A sufficient number of questionnaires were returned to obtain a statistically accurate representation of household opinion.

The respondents supported strengthening regulations to mitigate impacts of growth on the environment. A majority of respondents supported Meridian as the focal point for new business and desired smaller scale, locally-owned retail and services. Respondents also desired design standards for commercial signs, residential developments, landscaping, lighting, and architecture. Respondents gave top priority to building sidewalks, improving roads, and developing parks. The respondents clearly indicated that residential density in existing neighborhoods should not increase, but higher density development could occur where environmental conditions and infrastructure could support it.
SUMMARY OF THE SOUTH HILL COMMUNITY PLAN

The South Hill Community Plan contains policies and implementing actions for five subject areas or elements: Land Use Element, Community Character Element, Natural Environment Element, Economic Element, and the Facilities and Services Element.

LAND USE ELEMENT

The Land Use Element addresses land uses allowed in plan designations and the intensity of uses in the community. Policies promote preserving the natural environment, creating livable neighborhoods and distinct commercial centers, and identifying a central place.

COMMUNITY CHARACTER ELEMENT

The Community Character Element addresses urban design, community character, heritage, and social interaction. The policies promote urban design, natural environment retention, and transportation connections.

NATURAL ENVIRONMENT ELEMENT

The Natural Environment Element includes consideration of the natural resources found in the area. The citizens in South Hill value the function and aesthetics of the natural environment. The policies promote preserving ecological functions and incorporating the natural environment into site design.

ECONOMIC ELEMENT

The Economic Element focuses on the economy of South Hill. The CPB envisions a variety of commercial opportunities to meet the needs of the community and the surrounding region. Policies focus on restructuring Meridian Avenue to concentrate commercial, office and high density residential uses within designated centers. Employment and training opportunities related to aviation and light manufacturing will be provided in the Thun Field employment area.

FACILITIES AND SERVICES ELEMENT

The Facilities and Services Element addresses the infrastructure needed to maintain a desirable quality of life in South Hill. Infrastructure includes capital facilities such as roads, parks, trails, stormwater, schools, utilities, and the Thun Field Airport. The policies identify the capital improvements necessary to support the plan (roads, parks, sewers, water, etc.) and discuss potential partnerships within the community.
**PLAN MONITORING**

The Plan Monitoring section addresses how to measure the effectiveness and impacts of the plan over time.

**IMPLEMENTATION**

The plan also contains proposed amendments to the Pierce County Comprehensive Plan and Development Regulations which serve to implement various plan policies.

**VISION STATEMENT**

The citizens of South Hill envision a dynamic residential community with a variety of neighborhoods and housing choices. A locale where residential and business developments are integrated into the natural environment. A safe place, where schools and parks provide focal points and opportunities for citizen involvement in the social fabric of South Hill. A location where neighborhoods are connected to businesses, schools, and services through a functional transportation network that includes roads, sidewalks, bike lanes, and, where needed, transit services. A community where small neighborhood businesses provide the daily needs of local residents. A part of Pierce County where public services meet the needs of the South Hill population.
Map of South Hill Heritage Corridor
Chapter 2: Land Use Element

Introduction

The Land Use Element of the South Hill Community Plan provides direction regarding the location and intensity of land uses. This element is intended to supplement and further refine the Land Use element of the Pierce County Comprehensive Plan. Where the community plan provides specific guidance regarding land uses, the policy language of this plan will govern. Where the community plan does not provide specific guidance, the reader is directed to utilize the land use objectives, principles, and standards of the Pierce County Comprehensive Plan.

The Land Use Element addresses the location and intensity of commercial, industrial, residential, and civic land uses. The element contains two main components: visions, objectives, principles, and standards that provide policy direction and guidance; and, recommend regulatory and non-regulatory implementation actions to carry forth the policy direction.

Description of Current Conditions

The citizens and business owners of South Hill are proud of the schools, neighborhoods, churches, choices and opportunities, and the people that define their community. However, the character of South Hill has drastically changed in the past 30 years and these changes have not always been for the better. In the late 1960’s, South Hill was a rural community containing farms and large tracts of land. In 1972, the construction of State Road 512 was completed, opening the door for development.

Numerous housing developments were permitted and constructed based on Pierce County’s substandard land use regulations throughout the 1970’s, 1980’s, and early 1990’s. Several major housing developments known as master planned communities were also permitted during this time and significantly changed the face of the community. Three of the largest developments are still in construction. Gem Heights is nearing completion of 1,738 homes located in the southern part of the community immediately west of Meridian. The Sunrise development located in the southeastern corner of the community is approximately 25 percent complete with a buildout expectancy of 3,446
housing units. Finally, the Silver Creek master planned community located south of 176th Street East and west of Meridian Avenue is just beginning construction of 2,889 homes. These three developments alone will house a minimum of 16,000 people and are more likely to house upwards of 20,000 people. A considerable number of smaller residential developments, ranging from 4 homes to 100 homes, were also permitted and developed throughout the 70’s, 80’s, and 90’s adding development and population throughout South Hill.

In 1995 Pierce County adopted a Comprehensive Plan in accordance with the Washington State Growth Management Act. The Plan directs growth into urban areas including South Hill. The Comprehensive Plan assigned commercial growth to Meridian Avenue, while the rest of the community was designated for single-family residential uses. The Comprehensive Plan did not address whether certain neighborhoods should or should not have higher densities, where environmental constraints limit development, or unique places of the community. The implementing regulations for the Comprehensive Plan provided for consistency throughout unincorporated Pierce County. The regulations included new requirements for landscaping and stipulated the allowable range of densities for each zone classification. Revisions were made to the regulations in the late 1990’s to include standards for sidewalks, lot size, curb, and gutter. The Comprehensive Plan did not address signs, architecture, site layout, pedestrian facilities, or lighting. These items were left for communities to decide through a more interactive community plan process.

The following information provides background on the existing land development patterns, population, and housing within the South Hill community.

**Existing Land Uses**

The Pierce County Assessor’s Office classifies how parcels are used for purposes of calculating assessed value for taxation. Pierce County Planning and Land Services routinely uses this information to determine distribution of land uses within specific areas. The Assessor’s information is known to periodically contain errors, but is considered accurate for planning purposes. The Assessor’s information reflects only how land is currently being used and does not reflect zoning. The following table summarizes the current uses of land within South Hill in order of most to least acreage based upon Assessor information:

**Note:** The remaining 1.36% of parcels, 152.52 acres, straddle the South Hill Community Plan boundary along its border with the City of Puyallup urban growth area.

As shown in the table, the two prevailing categories of land use in the plan area are residential (46%) and vacant (32%). Together these two use categories account for 78% of total acreage in the community. The dominant land use type is single-family residential (38.3%, 40.9% when adding mobile homes on individual lots). The next most extensive land use types are: utilities (3.6%), agriculture (2.4%), and duplexes (1.8%).

The physical distribution of land uses is shown on Map J-7: Historic Assessed Land Uses. As previously noted, the prevailing land use within South Hill is residential. Residential uses are distributed throughout the community. Residential lot sizes vary throughout the community from small, densely suburban lots to larger estate-type lots. Smaller lot sizes are dominant in the southern portion of the plan area inclusive of the Gem Heights, Sunrise, and Silver Creek developments. Small lot sizes are common along the Woodland/70th Avenue corridor between 128th Street East and 152nd Street East. Finally, smaller lots are also located in the northern portion of the community near the City of Puyallup.
Larger lot sizes are commonly located on environmentally constrained lands such as steep slopes or wetlands. Large lots are found immediately west of Meridian, generally between 128th Street East to 160th Street East and extending west from Meridian to approximately 78th Avenue East. Large lots are also located immediately east of Thun Field south of 152nd Street East. Multifamily housing, which includes duplexes, triplexes, fourplexes and apartment buildings, is scattered throughout the community. The greatest concentration of multifamily housing units is located in the northern portion of the community along 122nd Street East. Table J-1 shows that multifamily housing comprises only 3.01% of the total land uses within South Hill. The prevailing multifamily housing type in South Hill is duplexes, which make up 1.79% of the total 3.01%. Triplexes, fourplexes, and multifamily buildings comprise only 1.22% of the community.

Civic uses are the second most common land use and comprise 8.55% of the community. Civic land uses include such items as utilities, educational facilities, transportation, and education. Utilities are dominant in the civic category (3.25%). K-12 education (1.10%) and non-profit recreation (1.54%) comprise the other main uses considered.

Commercial and industrial land uses comprise approximately 3% of the South Hill community. Commercial land uses are divided in offices, services, or retail uses. Retail uses are the foremost type of commercial use in South Hill (1.22%). Services such as restaurants and theaters comprise less than 1% of the uses commercial uses while office uses are fairly uncommon. The existing land uses along Meridian Avenue are auto-oriented commercial uses, a limited amount of light industrial uses, and scattered vacant land.

Although vacant lands are scattered throughout the community, there is a concentration in the southeast part of the community in and around the Sunrise development and Thun Field. Other large vacant parcels are located in the western portion of South Hill and in the Silver Creek development south of Gem Heights. Smaller vacant areas also exist in the northeast part of the plan area.

**CURRENT COMPREHENSIVE PLAN DESIGNATIONS AND ZONING CLASSIFICATIONS**

The 1994 Pierce County Comprehensive Plan, as amended, establishes six different land use designations within South Hill. These land use designations are Moderate Density Single-Family (MSF), High Density Residential District (HRD), Master Planned Community (MPC), Employment Center (EC), Community Center (CC), and Mixed Use District (MUD). These land use designations indicate the type, intensity, and density of land uses authorized by the Comprehensive Plan.

The MSF, HRD, and MPC designations are residential in nature, the EC designation is industrial and office, the Community Center is a combination of commercial and residential, while the MUD designation is auto-oriented commercial that also allows residential uses. These land use designations are implemented on a parcel specific basis through zoning. The land use designations do not necessarily reflect the current use of land. For example, property used for auto-oriented commercial purposes could be designated EC, an industrial use designation. The following table summarizes the land use designations in terms of acreage:
Table J-2: Comprehensive Plan Land Use Designations - 2002

</tbody>
</table>

Land use designations are shown on Map J-8: Historic Land Use Designations/Zoning.

The MSF designation is the prevailing land use designation and is found throughout South Hill. The southern end of the community is dominated by three large residential developments with MPC designations, i.e., Sunrise, Gem Heights, and Silver Creek. A moderately sized planned community, known as Rainier Terrace, is located in the northeastern portion of South Hill. A small area of HRD designation is located on the west side of Meridian Avenue in the neighborhood of 94th Avenue East and 136th Street East.

Meridian Avenue is currently dominated by the auto-oriented MUD designation. This designation generally extends one-quarter mile along both sides of the Avenue. While the dominant land use designation along Meridian is MUD with 584 acres and 430 parcels, only 25% of the Avenue is currently comprised of existing commercial uses (137 acres, 112 parcels).

The south end of Meridian Avenue is designated EC. This area, including Thun Field-Pierce County Airport, is identified as a location for a variety of manufacturing, assembly, warehousing, and office uses.

**Moderate Density Single-Family**

The Moderate Density Single-Family (MSF) land use designation/zone classification is intended to provide areas for urban single-family and two-family residential development at densities of 2-6 dwelling units per acre. The MSF designation is the predominant designation in South Hill. Approximately 63% of South Hill (7,680 acres) is designated as MSF.

**High Density Residential District**

The High Density Residential District (HRD) designation is intended to provide areas of multifamily and high density single-family housing along with limited neighborhood commercial retail and service uses. Allowed residential densities in the HRD range from 6 to 25 dwelling units per acre. There is one area designated HRD located in the vicinity of 136th Street East and 94th Avenue. This designation accounts for less than .2% of the community and contains fewer than 30 acres.
**Master Planned Community**

The Master Planned Community (MPC) designation is intended to achieve well designed, compact, urban development, with a balance of uses, more efficient use of public facilities and a greater amount of open space than would be required under standard development. MPCs integrate a mix of housing, services and recreation and are approved through a planned unit development or planned development district process. MPCs must encompass a minimum of 320 acres. Four MPCs exist in South Hill: Gem Heights, Silver Creek, Sunrise, and Rainier Terrace. These communities comprise nearly 2,700 acres and account for approximately 22% of the land mass of South Hill.

**Community Center**

The Community Center (CC) designation has as its focus a significant traffic generator around which develops a concentration of other commercial office, services, and some high-density residential development. The commercial activity is drawn from customer base of more than one neighborhood. CCs are places for the community to gather and converse, places where people live, and places with civic elements. The CC designation includes 90 acres of land located along Meridian Avenue just south of the 160th Street intersection. The CC designation accounts for .7% of the community.

**Mixed Use District**

The Mixed Use District (MUD) designation provides for auto-oriented commercial and land intensive commercial uses along major arterials, state highways, and major transit routes. Commercial activity in MUDs serves a customer base beyond the surrounding neighborhoods or community. The MUD designation is typically located along a roadway used by residents of more than one community or serving a region. The MUD designation also allows for multifamily residential uses. The MUD designation accounts for approximately 648 acres of land, totaling 5.4% of the community.

**Employment Center**

The Employment Center (EC) designation provides land for industrial, manufacturing, and office jobs. Uses in the EC range from land intensive heavy industrial, (e.g., manufacturing, product assembly, fabrication, and processing, and heavy trucking uses) to light manufacturing, assembly, and wholesale activities, to corporate office and office park development. Commercial uses subordinate to and supportive of employment uses are also permitted. The EC designation is currently located at and surrounding the Pierce County Airport at Thun Field. The EC designation currently totals 963 acres of land in South Hill.

**Description of Desired Conditions**

The South Hill Community Plan builds upon the strengths of the community and restates the objectives of the County Comprehensive Plan in accordance with the desires of South Hill citizens, as well as the actual land uses in existence in the community. The community plan
does not contradict the Comprehensive Plan, but refines the designations and zones and the
allowed uses and implementing regulations in accordance with what is appropriate for the
South Hill community.

South Hill will continue to be a residential community in the
future, but the infrastructure, amenities, and housing
choices will be different than today. Commercial uses will
also continue to be located along Meridian Avenue. Rather,
the community plan prioritizes reshaping or restructuring
Meridian Avenue into several centers that are more inclusive
of pedestrians, green space, and a mix of residential uses
with commercial components.

The community plan will change the future landscape of South Hill based on the priorities of the
local residents. These priorities are detailed below.

The community plan attempts to ensure development is accompanied by appropriate
infrastructure such as sidewalks, roads, and bicycle paths. A top priority is connections within
neighborhoods, between neighborhoods, and throughout the community. Plan policies and
action steps prioritize:

• sidewalk connections from schools to surrounding neighborhoods;
• sidewalk connections extending from one subdivision to another in a continuous fashion;
• sidewalk and bicycle connections from residential areas to commercial areas; and,
• pedestrian and bicycle facilities within commercial centers so the auto is not the only mode
  of travel.

Parks are also of great importance in the community plan. Residents of South Hill are disgusted
at the lack of community and regional parks, and further dismayed at the standard gratuitous
tot lot provided in current residential subdivisions. This situation is unacceptable to South Hill
citizens. The South Hill plan calls for revisions to the Pierce County Parks and Recreation Plan to
include the list of priority parks identified in the Facilities and Services element of the
community plan. The implementing regulations revise County regulations in terms of
placement and quantity of recreation area within residential subdivisions.

Tree and vegetation retention are also emphasized ensuring the community will provide
integration with the natural environment in coming years. Tree retention or replacement
would be required for all new developments. Landscaping requirements are also included in
the implementing regulations for the plan.

Another major difference between the Comprehensive Plan and the community plan are
requirements for design. Since adoption of the Comprehensive Plan, Pierce County has worked
with individual communities toward the formulation of community plans. Through this process,
it has become apparent that a major concern of all communities is that of design, particularly
building design and sign design. Building architecture and the predominance of signs are major
concerns within Pierce County communities and thus, have been regulatory features included
in every community plan proposed since 1995.
The community plan introduces regulations for South Hill that address architectural design for commercial buildings, sign design, and lighting design. The plan also includes standards for site design for commercial and residential to ensure new development is integrated into the natural environment to the greatest extent possible.

The design standards are intended to improve not only the visual character of the community, but the function of land uses as well. For example, a parking lot that includes marked or striped pedestrian walkways, shade trees, and sidewalk connections to surrounding neighborhoods is more likely to have pedestrian usage than the parking lot that does not include these amenities. These simple measures can change not only the way a land use looks, but the function as well.

Finally, the South Hill Community Plan recognizes that not all housing needs or desires are alike and thus, provides a variety of housing choices. For example, many seniors and single parents like to live on smaller lots with homes fairly close together. This housing meets their needs as it provides a sense of security and doesn’t require a lot of yard maintenance. Other families like to live on the homestead, a larger estate-type lot where the sense is of a rural nature, although located within an urban area. The community plan allows for estate, mid-size, small lot, and multifamily residential development while maintaining the dominant pattern of 2-6 dwelling units per acre.

Small neighborhood centers are introduced into several residential neighborhoods. These centers are intended to allow opportunities for local citizens to obtain a few daily goods without having to get into a car and travel to Meridian Avenue. Neighborhood Centers will allow opportunities for children to walk or bike to a store to pick up an ice cream sandwich or candy bar. Alcohol and tobacco sales are prohibited and hours of operation are strictly limited in Neighborhood Centers.

The citizens of South Hill accept the location of their community within the urban growth boundary, but want to ensure livability features are in place as growth occurs. Too often, infrastructure and services have lagged far behind population growth. The South Hill Community Plan strives to provide the features that lend to a more livable community for South Hill.

**PROPOSED DESIGNATIONS AND ZONING CLASSIFICATIONS**

**Mildrate Density Single-Family Designation**

The community plan retains the Moderate Density Single-Family (MSF) designation as the dominant land use type for South Hill. This designation is the same as the Pierce County designation and allows for single-family or two-family dwellings. Multifamily housing (three units and above), commercial, and industrial uses are prohibited. Specific densities are based on existing densities, physical constraints, and the availability of urban services such as sewers. The designation allows 2-6 dwelling units per acre.
**PROPOSED ZONING**

The Moderate Density Single-Family plan designation will be implemented by two zoning classifications: Moderate Density Single-Family (MSF) and Residential Resource (RR). These zone classifications are provided intended to provide a greater variety of housing choices for South Hill citizens.

The MSF zone that is proposed by the community plan is the same as Pierce County’s current MSF zone classification. The primary land use allowed is low to moderate one- and two-family housing and compatible civic uses such as churches or schools. The minimum density for the zone (two dwelling units per acre) and the maximum density for the zone (six units per acre) remains unchanged.

The Residential Resource (RR) zone classification is a new classification for South Hill. It is intended to provide for low-density single-family residential uses compatible or integrated with areas of unique open space character and/or environmental sensitivity. The zone classification would be the least intensive of Pierce County’s urban zones, permitting a density of one-to-three dwelling units per acre. This zone is located in environmentally constrained areas, open space corridors, and areas containing priority habitat for wildlife.

**HIGH DENSITY SINGLE-FAMILY DESIGNATION**

The High Density Single-Family (HSF) land use designation incorporates higher density, detached single-family development in the South Hill Community Plan area. The minimum and maximum densities reflect an attempt to encourage higher density residential developments off of the Meridian corridor. The implementation of site and architectural design standards is necessary to address the typically unfavorable perception of high density single-family development.

**PROPOSED ZONING**

The High Density Single-Family zone classification is a new zone for South Hill. It differs from the HRD and MHR because it does not allow for any multifamily uses, including duplexes. The zone is intended for single-family homes that are constructed on small lots. The HSF zone does not allow for attached dwelling units and all entryways must be located at ground level. The HSF zone allows 6 to 12 homes per acre.

**HIGH DENSITY RESIDENTIAL DISTRICT DESIGNATION**

The High Density Residential District (HRD) designation will continue to apply within the community; however it will be increased beyond the 30 acres designated today. The HRD is intended to be multifamily and high-density single-family with very limited commercial uses. All developments within the HRD designation are required to meet the design standards for South Hill.
**PROPOSED ZONING**

The High Density Residential District plan designation will be implemented by three zone classifications: High Density Residential District (HRD), Moderate-High Density Residential (MHR) and High Density Single-Family (HSF).

The High Density Residential District (HRD) zone classification provides for multifamily and high-density single-family housing along with very limited commercial uses. Allowed densities in the HRD range from 6 to 25 dwelling units per acre accompanied by strict design regulations. The High-Density Residential zones are generally located along Meridian Avenue. The zone is located north of 128th Street East along 98th Avenue, at the intersection of 156th Street East and Meridian Avenue, and east of the community of Gem Heights south of the 160th Street intersection. The High Density Residential zones are intended to provide housing opportunities for people who would like to be located close to the commercial centers along Meridian Avenue.

The MHR zone is a new zone classification for South Hill. It differs from Pierce County’s HRD zone in that it does not allow for commercial uses, and residential densities are slightly lower. The MHR zone permits moderate and high-density single-, two-, and multifamily housing and compatible civic uses. The residential density range for this zone is six to 20 dwelling units per acre. Areas zoned MHR are located primarily where multifamily uses currently exist such as along 122nd Street East and east of Meridian on 128th Street East. The Sunrise and Silver Creek developments are planning to construct multifamily uses. These areas are recognized through the community plan by the MHR zone.

**COMMUNITY CENTER DESIGNATION**

The Community Center land use designation will continue to apply within the community plan area. The primary role of Community Centers is to provide retail and service opportunities that residents are likely to access on a weekly or frequent basis such as grocery stores, restaurants, or banks. Community Centers serve a market greater than a neighborhood, but not greater than the South Hill community. Site design and building orientation should safely accommodate pedestrians and will incorporate interaction with surrounding residential neighborhoods. Community Centers are intended to be both pedestrian and auto accessible where the pedestrian is clearly comfortable in the center, but the automobile also has a presence.

Though the focus of a Community Center is commercial activity, these centers are designed to be places for the community to gather and converse, places where people live, and a place with civic elements. One Community Center is designated along Meridian Avenue East from 120th Street East to approximately 164th Street East. Three Community Centers are located along 176th Street East within the planned developments of Gem Heights, Silver Creek, and Sunrise. These Community Centers are reflected on
the map for the South Hill community. All uses within Community Center designations are subject to the design standards for South Hill.

**PROPOSED ZONING**

The Community Center plan designation will continue to be implemented by the Community Center (CC) zone classification and a new zone classification entitled Urban Village.

The CC zone is nearly identical to Pierce County’s current CC zone classification. Residential densities are slightly lower (8-20 units per acre) to encourage more residential growth within the Urban Village. The uses permitted in the zone are generally the same, with a few minor modifications such as no longer allowing bulk fuel dealers within the zone. The CC zone is intended to be oriented to serve the pedestrian, but able to accommodate the automobile.

The Urban Village zone is new to both South Hill and Pierce County. The purpose of the Urban Village is to provide an opportunity for South Hill to have a focal point or central place of the community. The Urban Village is intended to be a vibrant place where citizens gather, work, live, or shop. It is to offer a well-designed mix of living, shopping, office, and leisure activities. Businesses within the Urban Village are to be pedestrian dependent. Design standards for the Urban Village require residential uses to be mixed with commercial uses and require businesses to be connected via plazas and open-air walkways. Density within the Urban Village is based on the amount of commercial area provided.

**NEIGHBORHOOD CENTER DESIGNATION**

The primary role of the Neighborhood Center is to provide local residents daily goods or frequently needed services without having to travel to large commercial areas on Meridian Avenue. Neighborhood Centers are reminiscent of the old corner store with pedestrian orientation and just a store or two. The Neighborhood Center zone classification is a concentrated mix of small-scale retail and service commercial and offices that serve the daily needs of residents within the immediate neighborhood.

Within South Hill, Neighborhood Centers are restricted to certain uses and hours of operation. The design standards and regulations for Neighborhood Centers are some of the most stringent within the community. These restrictions are important to ensure the Neighborhood Centers are compatible with the surrounding residential homes.

Residential development at various densities may occur within the center if appropriate to the individual neighborhood. Within South Hill, there are six Neighborhood Centers: 1)
intersection of 128th and 86th Avenue; 2) intersection of 144th and 86th Avenue; 3) intersection of 160th and 86th Avenue; 4) 160th Avenue East slightly east of 92nd Avenue; 5) 122nd Avenue just south of 149th Street; and, 6) intersection of 122nd Street and Shaw Road.

**PROPOSED ZONING**

The Neighborhood Center (NC) designation will be implemented by two zone classifications: Neighborhood Center (NC) and Residential/Office-Civic (ROC). All of the proposed Neighborhood Centers are implemented by the NC zone classification with the exception of the center at 122nd Street and Shaw Road. The ROC zone will implement the NC designation in this neighborhood.

The uses permitted in the NC zone classifications are oriented to small-scale retail sales or services. Uses such as day care centers, small grocery stores, doctor or dentist offices, and espresso sales would be allowed within the zone. Gas stations are not allowed.

The ROC zone permits only residential, office or civic uses. Retail sales are prohibited within this zone. It is intended to allow offices such as doctor, dentist, accountant, real estate, or postal services.

**MIXED USE DISTRICT DESIGNATION**

The primary role of the Mixed Use Districts (MUDs) is to serve auto-oriented commercial activities. Mixed Use Districts have a loosely defined sense of place, are auto-oriented, and are generally moderate to high intensity of uses. Mixed Use Districts are areas of mixed commercial retail, service, office uses where single trip, auto-oriented and auto-dependent businesses dominate. Mixed Use Districts are characterized by individual businesses on separate lots with separate access and parking lots. Commercial activity in Mixed Use Districts caters to a customer base beyond the surrounding neighborhoods or community due to its placement on a roadway used by residents of more than one community. Auto-oriented commercial and land-intensive commercial with a low number of employees per acre is the primary use within Mixed Use Districts.

**PROPOSED ZONING**

The Mixed Use District plan designation will continue to be implemented by the Mixed Use District (MUD) zone classification, however, residential uses will not be allowed within the zone. The MUD has the least restrictive design requirements although it must provide for substantial landscaping. The MUD zone is located along the intersection of 176th and Meridian and is reflective of current land uses. Most of the commercial businesses within the MUD zone located at Meridian and 176th Street East are relatively new, and therefore not likely to redevelop within the next 20 years.

**EMPLOYMENT CENTER DESIGNATION**

The Employment Center designation is the same as within the Pierce County Comprehensive Plan, although the allowed uses are restricted to recognize the need for compatibility with the Pierce County airport. The Employment Center (EC) designation provides land for appropriate
Civic, Utility, Office, Resource, commercial and industrial uses. Commercial uses subordinate to and supportive of employment uses are also permitted. The EC designation is currently located at and surrounding the Pierce County Airport at Thun Field.

**PROPOSED ZONING**

The Employment Center designation is implemented through the Employment Center and Employment Service zones. Allowed uses within the zones are restricted to: aviation-related manufacturing, commercial, civic, utility, and industrial services and sales.

The following tables and maps illustrate the changes in land use designations and zone classifications contained within the community plan.

Pierce County Comprehensive Plan | South Hill Community Plan
**Activity Center Designation**

The Activity Center is intended to function as a primary civic center within the community and will generally have a unique recreational, cultural, or community amenity as its focal point. The Activity Center also serves as the transitional area between this amenity and adjacent commercial and residential areas. Within the Activity Center, a broad range of commercial, civic, and residential uses will be allowed and incentives will be offered to projects that provide a mix of these uses within individual buildings. Encouraging this mix of uses will help to promote and support the level of civic and recreational activity desired in the Activity Center. Within the South Hill Community Plan area, there is currently one geographic area that has been identified as an ideal location for an Activity Center. This 71-acre area is located at the crossroads of 144th Street East and Meridian Avenue East and includes the Amphitheater at South Hill and adjacent commercial areas.

**Proposed Zoning**

The Activity Center (AC) plan designation will be implemented by the Activity Center zone classification. This zone has civic uses as its primary focus but also permits a wide range of commercial uses and residential uses.

**Land Use Policies**

**Goals**

We envision a predominantly residential community that incorporates environmentally sensitive areas, high traffic corridors, and desired open space. We see the core of the urban residential environment as moderate density single-family housing. While high density multifamily housing acts as a buffer along major traffic corridors, low density housing mitigates development impacts to the natural ecosystem in environmentally sensitive areas. The predominant South Hill commercial area will adjoin the Meridian corridor, with secondary commercial areas located in separated districts along other major traffic corridors. The Thun Field area will emerge as the home to a diverse group of industries and businesses that provide products and services related to healthcare, professional services, education, aviation, light manufacturing, and high technology.

**General**

**GOAL SH LU-1** Establish land use patterns that integrate the natural environment and provide compatibility among different uses.

**SH LU-1.1** Uses should embrace a livable community of residential, commercial, and civic uses situated among trees and green space, supplemented by design features that lend to a greater sense of community, and connected by a fully linked system of roads and nonmotorized pathways.
SH LU-1.2 Stay the course articulated in the community plan; this includes elected officials, community leaders, citizens, and County employees.

SH LU-1.3 The Urban Growth Area (UGA) boundary should remain as currently located to result in redevelopment and improvements to achieve the specified goals.

SH LU-1.3.1 Pierce County should not expand the Urban Growth Area south of the plan area to encourage the redevelopment of existing properties.

SH LU-1.4 Allow time for change to occur by recognizing that the community plan influences land use patterns for 20 years and beyond.

SH LU-1.4.1 The future land use pattern for the South Hill community shall reflect long-range community desires and economic goals. Short-term benefits shall not preclude the realization of long-range goals.

SH LU-1.4.2 Parcels should not be rezoned within the first two years of plan adoption to allow appropriate time for the market to adjust.

SH LU-1.5 Recognize that the adoption of the plan will result in the creation of nonconforming uses. Over time, the gradual redevelopment of nonconforming uses will aid in achieving community-wide goals.

GOAL SH LU-2 Reverse the existing pattern of residential and commercial sprawl. This should be accomplished by:

SH LU-2.1 Providing for a variety of housing types and densities throughout residential zones;

SH LU-2.2 Allowing small-scale neighborhood commercial centers interspersed among residential areas; and,

SH LU-2.3 Reshaping commercial activities along Meridian Avenue through providing appropriate land use designations and design standards.

GOAL SH LU-3 The pattern of residential development should reflect the community's desire to preserve environmentally sensitive areas and open space corridors.

SH LU-3.1 Higher densities should be allowed only outside of areas with environmental constraints.

GOAL SH LU-4 Intersperse small-scale neighborhood centers throughout the community residential areas.

SH LU-4.1 The purpose of the neighborhood centers is to provide citizens the opportunity for frequent/daily shopping or service activities without having to drive to Meridian Avenue.

GOAL SH LU-5 Reshape commercial activities along Meridian Avenue to stop the continuous strip pattern.

SH LU-5.1 Commercial districts of similar activities shall be designated along portions of Meridian Avenue.
SH LU-5.2  The uses and intensity of commercial districts along Meridian should serve both regional and community needs.

SH LU-5.3  Residential districts may be integrated along Meridian Avenue to separate commercial districts.

SH LU-5.4  Designate underdeveloped and vacant parcels along Meridian Avenue for non-commercial uses to break up the existing continuous commercial corridor.

GOAL SH LU-6  Utilize innovative techniques and strategies to achieve the desired land use patterns and supporting infrastructure.

SH LU-6.1  Regulatory requirements should provide incentives for redevelopment and infill opportunities.

SH LU-6.2  Provide incentives for redeveloping nonconforming uses and structures.

SH LU-6.2.1  Provide alternative development opportunities for landowners along Meridian Avenue.

SH LU-6.2.2  Minimize the creation of nonconforming businesses along Meridian Avenue.

SH LU-6.3  Ensure zoning regulations that provide flexibility in the development of individual parcels without undermining the community’s desired land use pattern.

SH LU-6.3.1  Adopt incentive-based density and intensity regulations that provide a menu of choices.

GOAL SH LU-7  Provide strict guidance for rezones to ensure community plan goals and objectives are properly implemented.

SH LU-7.1  The proposed zone must be an allowed zone under the existing land use designation.

SH LU-7.1.1  Rezones cannot be used to enlarge the land area of a center or alter the boundaries of the center.

SH LU-7.1.2  Changes in land use designation are not permitted through rezones.

SH LU-7.1.3  Ensure commercial rezone applications are consistent with the intent, goals, objectives, and standards as set forth in the South Hill Community Plan.

SH LU-7.1.4  Commercial rezones shall be applied only within designated urban centers and districts.

SH LU-7.1.5  Commercial rezones may be allowed when the following criteria are met:

SH LU-7.1.5.1  A Planned Development District (PDD) shall accompany all rezone applications;
SH LU-7.1.5.2  An analysis of market vacancy has demonstrated there is a need for the commercial use type within the South Hill Community Plan area. The analysis must consider the availability of vacant commercial buildings for the same type of use and shall demonstrate why the rezone is necessary. The analysis shall not be an analysis of market potential; and

SH LU-7.1.5.3  The Examiner shall provide written findings that the proposed zone and PDD implement the goals, objectives, and standards of the designation better than the existing zone.

SH LU-7.2  Ensure residential rezone applications are consistent with the intent, goals, objectives, and standards as set forth in the South Hill Community Plan.

SH LU-7.2.1  Residential rezones may be allowed if it is demonstrated that more than 5 years have passed since the last change in zoning and the following criteria are met:

SH LU-7.2.1.1  If the request is to up-zone from Residential Resource, it must be demonstrated that the environmental constraints qualifying the property for such classification no longer exist on the site, or that the development will be designed in a manner that provides protection of the environmentally constrained area and provides designated areas of wildlife habitat and open space;

SH LU-7.2.1.2  An analysis of market vacancy has demonstrated that there is a need for higher density within the South Hill Community Plan area. The analysis must consider the availability of buildings for the same type of use and shall demonstrate why the rezone is necessary. The analysis shall not be an analysis of market potential;

SH LU-7.2.1.3  Compatibility with surrounding uses shall be maintained; and,

SH LU-7.2.1.4  For any rezone request to allow higher densities, connection to sewers shall be required.

GOAL SH LU-8  Pierce County shall ensure the South Hill Community Plan is monitored to provide feedback and identify appropriate and necessary revisions.

SH LU-8.1  Detail a monitoring process or plan that will be an effective tool.

SH LU-8.1.1  At the five-year review of the community plan, development data should be reviewed to measure the success toward realizing the community’s goals, including housing affordability, as required under the Comprehensive Plan.

SH LU-8.1.2  Evaluate and record the effectiveness of development regulations and incentives, including their effectiveness in preserving affordable housing in the community plan area as required by the Comprehensive Plan.

SH LU-8.1.3  Identify achievable implementation measures or actions if desired results are not realized.
Pierce County shall work closely with the South Hill Advisory Commission to implement and monitor the community plan.

Each year, the South Hill Advisory Commission, with the assistance of Pierce County, shall develop a work program aimed at accomplishing the short, mid, and long-term goals of the South Hill Community Plan.

Planning and Land Services shall provide year end reports to the advisory commission summarizing the accomplishments and making recommendations for the upcoming year.

**GOAL SH LU-9**

Ensure compatibility between adjacent land uses.

Ensure the incentive-based, flexible regulations contain the necessary requirements to allow for higher density development. Higher density development shall not occur when infrastructure is inadequate and amenities are absent.

Higher densities located next to lower densities are considered compatible when appropriate infrastructure such as safe roads, vegetation, stormwater, bike, and pedestrian connections are provided. For increased compatibility, include design features that soften the intensity difference and provide reasonable light while not glaring onto adjacent properties.

Designate land uses adjacent to the Pierce County Airport/Thun Field that are compatible with aviation activity and complement the South Hill Community Plan goals.

Develop criteria, standards, and compatible land use designations that will protect the South Hill community and aviation users by adopting implementing regulations consistent with the WSDOT Aviation Division guidelines, *Airports and Compatible Land Use, Volume 1*.

**GOAL SH LU-10**

Implement distinct zoning districts for a variety of residential choices including estate, mid-size, small lot, multifamily, senior housing, and mixed use development.

Building footprints should correspond to the approximate size of the residential lot:

- **Estate (large lot, large home);**
- **Mid-size (yard/home proportionate); and**
- **Small lot (small lot, smaller home).**

Low residential densities should be located in the vicinity of environmentally constrained lands such as wetlands, floodplains, slopes, groundwater recharge areas, and priority wildlife habitat.
Moderate density residential development should be allowed in established areas that do not have potential for redevelopment within the next 20 years.

Higher density residential development should be located within and around the Urban Village to promote the pedestrian activities and provide activity and safety at night.

Higher density residential development should be located in areas that have potential for redevelopment.

High density and small-lot development provide opportunities for affordable housing, starter homes for young families, and downsizing opportunities for seniors.

Higher density residential should be located throughout existing residential neighborhoods where infrastructure is available or can be improved by construction of the higher density.

Provide on-site density credits for the Residential Resource zone.

Recognize that areas zoned for both commercial and residential uses typically develop as all commercial uses. Remedy this situation by ensuring opportunities for both high density housing and true mixed use.

Establish a zone that allows for high density housing that does not include commercial development.

Ensure opportunities for a true mix of uses that contain both commercial and residential components.

Require residential uses in certain mixed use zones to ensure both residential and commercial development occur.

Allow non-residential uses within residential areas.

Limited non-residential uses such as churches, schools, and daycares should be allowed within residential areas.

Non-residential activity should be scaled and sized appropriately to ensure compatibility within the neighborhood.

Create separate and distinct commercial centers along Meridian Avenue through zoning and design standards. Establish centers for specific purposes, designed in appropriate scale and intensity for the identified function and purpose.

Create separate and distinct districts along Meridian Avenue providing the highest quality private and public sector developments that connect to adjacent neighborhoods, preserve pockets of natural areas, and move through traffic safely and efficiently.
Reshape the existing commercial corridor along Meridian Avenue into separated commercial nodes distinguishable through activities, architecture, and site design and are based on the surrounding neighborhood and development potential.

Limit the size and configuration of commercial areas to direct land uses to desired locations at intended intensities.

Designate portions of Meridian Avenue to break up the continuous commercial development and encourage a greater variety of uses.

Encourage mixed use projects that provide an attractive, convenient, and stylish setting for residents and a captive market for retailers.

Encourage opportunities for small-scale retail.

Allow warehouse retail shopping centers, also known as big-box retailers, in specified districts.

Ensure civic, recreational, residential, office uses, and open space uses are mixed in with commercial development.

Arrange the diverse land uses in ways that encourage walking and discourage driving for short trips and errands.

Rezone designated areas in mature strips for urban mixed use projects and higher density housing.

Link the higher density development districts with high capacity transit.

Identify districts, and designate and zone accordingly to encourage development.

Aggressively seek nuisance abatement to eliminate problems that inhibit achieving the goals of the districts and the community.

Dilapidated or abandoned buildings and illegal land uses shall be corrected or eliminated.

The County shall inventory these properties and develop a program to eliminate or correct them.

Establish a variety of commercial districts that serve specific purposes. The scale and intensity of activities should be in conformance with the purpose of the commercial node.

Designate an area for regional commercial uses.

The purpose of the regional commercial district is to provide opportunities for large, auto-oriented businesses.

The type of commercial uses in the regional commercial district should serve a regional market, i.e., a market greater than South Hill residents and businesses.
SH LU-16.3 The permitted commercial activities may include land consumptive (e.g., modular home sales) and auto-dependent businesses (e.g., warehouse grocery or building materials and supplies).

SH LU-16.4 The size of the individual commercial buildings should be unlimited.

SH LU-16.5 Residential uses are incompatible with regional commercial uses and should not be allowed.

SH LU-16.6 Regional commercial uses that generate traffic and draw from a market that includes more than the South Hill community should be located at regional crossroads, e.g., Meridian Avenue and 176th Street East, to deter regional traffic through the community.

SH LU-16.7 Regional commercial uses include stores and activities that require the use of an automobile such as a warehouse grocery, carpet, or furniture store. Regional commercial uses shall have design standards that lessen the impacts of noise, light, and glare.

SH LU-16.8 Regional commercial uses are identified as auto-dependent.

SH LU-16.9 Regional commercial uses should be identified with the Mixed Use District (MUD) designation.

GOAL SH LU-17 Designate two or three areas for community commercial uses.

SH LU-17.1 The purpose of the community centers is to provide retail and service opportunities that residents are likely to access on a weekly or frequent basis such as grocery stores, restaurants, or banks.

SH LU-17.2 Community commercial centers should serve a market not greater than South Hill residents and businesses.

SH LU-17.3 The permitted commercial activities should not include land consumptive or auto-dependent activities.

SH LU-17.4 The area of individual tenant space within commercial buildings shall be limited.

SH LU-17.5 Building mass and orientation should be pedestrian scaled.

SH LU-17.6 Site design and building orientation shall safely accommodate pedestrians and should incorporate interaction with surrounding residential neighborhoods.

SH LU-17.7 Each community commercial area shall be a compact node and not allowed to sprawl along Meridian Avenue in a continuous commercial strip.

SH LU-17.8 Community commercial uses should be identified with the Community Center (CC) designation.

SH LU-17.9 Community commercial uses draw from a variety of South Hill neighborhoods as the market.

SH LU-17.10 Community commercial uses should be dispersed in distinct nodes along Meridian Avenue for easy access from many neighborhoods of South Hill.
SH LU-17.11 Community commercial uses include stores and activities to which patrons can walk, drive, or take transit. Uses such as grocery stores, theaters, and large-scale clothing stores would be located in community commercial areas.

SH LU-17.12 Community commercial uses are identified as pedestrian-oriented and auto-accommodating.

SH LU-17.13 Community commercial centers shall contain design standards that emphasize pedestrians and pedestrian connections throughout the shopping district.

GOAL SH LU-18 Designate a few nodes for neighborhood center uses.

SH LU-18.1 Neighborhood commercial centers shall be designated Neighborhood Center and zoned, dependent upon allowed uses, either Neighborhood Center (NC) or Residential/Office-Civic (ROC).

SH LU-18.2 Permitted commercial uses should include small-scale retail and/or personal services that meet frequent or daily needs of residents living in the immediate neighborhoods.

SH LU-18.2.1 Uses such as dry cleaning and alterations, grocery stores, bakeries or coffee sales, accountants, or veterinarians are examples of acceptable types of uses for the Neighborhood Center designation.

SH LU-18.2.2 Banking services with or without drive-through facilities are allowed in the Neighborhood Center designation.

SH LU-18.2.3 Gas stations or gas stations with convenience stores and fast-food or drive-through restaurants are not acceptable types in the Neighborhood Center designation and shall not be allowed.

SH LU-18.2.4 Espresso stands, with or without drive-through facilities shall be allowed in the Residential Office/Civic zone classification.

SH LU-18.3 The Neighborhood Centers shall accommodate only uses that are scaled and sized appropriately to ensure coherence with the neighborhood.

SH LU-18.4 Retail operations in Neighborhood Centers shall be required to receive a conditional use permit to ensure consistency with community plan goals, policies, and design standards.

SH LU-18.5 Neighborhood Centers should serve primarily the local neighborhood.

SH LU-18.5.1 Hours of operation shall be strictly limited and shall not occur before 5:00 a.m. or after 10:00 p.m.

SH LU-18.5.2 Although 24-hour uses may offer convenience to adjacent neighborhoods, 24-hour uses such as gas stations with convenience stores and drive-through restaurants are inconsistent with the objective requiring Neighborhood Centers to be compatible with adjacent single-family residential areas.

SH LU-18.6 Sales of alcohol or tobacco products shall be prohibited in Neighborhood Centers.
Activities that generate excessive noise shall not be allowed within Neighborhood Centers.

Building size and area of individual tenant space shall be limited.

Spatially distribute Neighborhood Centers throughout South Hill in a manner that will maintain the scale of the neighborhood and not challenge the economic hierarchy and thus, the financial success of existing commercial areas.

Neighborhood Centers should be dispersed throughout the community to serve a majority of neighborhoods.

Neighborhood Center activities shall be low intensity and connected to the surrounding neighborhoods with a series of sidewalks and bicycle paths.

Local residents should determine the location and configuration of Neighborhood Centers.

Neighborhood Centers should be located where neighborhood commercial currently exists and new locations should be designated to serve more neighborhoods.

Designate a central place that is the focal point of commercial activity for the community.

Designate and zone an area that can be identified as a central place in South Hill. This area is envisioned to contain a variety of people-oriented shopping and leisure activities without the dependence or interference of the automobile.

The central place shall be designated Community Center and zoned Urban Village.

The Urban Village shall contain design standards that promote small-scale storefronts, taller buildings, plazas, pedestrian access, and landscaping.

The Urban Village should serve as a focal point of commercial and civic activities for the South Hill community.

Permitted uses should include civic, residential, and pedestrian-scaled retail activities.

A residential component such as lofts, senior housing, and apartments above retail storefronts shall be included in Urban Village.

Support business uses and regulatory measures that allow personal services, small-scale retail, and sit-down eating and drinking establishments.

All new commercial developments in the Urban Village must have residential uses as a component of the project.

Densities of projects within the Urban Village may exceed 25 units per acre when the project provides a mix of commercial and residential uses.

Designate an Activity Center within South Hill.
Designate and zone an Activity Center to provide a civic focal area for the community oriented around a unique recreational, cultural, or community amenity.

Activity Centers shall permit a broad range of commercial, civic, and office uses. Examples of such uses include professional offices, retail sales, retail and/or personal services, restaurants, grocery stores, bakeries or coffee sales, farmers markets, and churches.

Residential uses shall be limited to multifamily and attached single-family uses. Heavy industrial uses shall not be allowed.

Mixed use buildings shall be encouraged to locate within Activity Centers through the use of incentives. Examples of acceptable incentives include density bonuses, reductions in requirements for native vegetation and impervious surfaces, and similar measures.

Activity Centers shall be subject to design standards that emphasize pedestrians and pedestrian connections throughout the center, foster high quality architectural design, and promote quality site layout and planning.

Commit to appropriate steps ensuring that South Hill Urban Village will become a viable reality.

Focus public and private investments toward South Hill Urban Village.

Transit service and mobility improvements that serve the Urban Village should be given priority.

Encourage public/private partnerships to create the viability of the Urban Village.

South Hill’s development regulations should contain deadlines for processing permits and administrative appeal processes to avoid lengthy delays.

Pierce County should periodically review development within the Urban Village zone and identify barriers to efficient permitting.

To encourage compact development within South Hill Urban Village, Pierce County shall maintain information on available and underutilized parcels in coordination with Pierce County’s Buildable Lands program.

Provide for small-scale manufacturing and aviation-related industries while ensuring public safety.

Provide some industrial lands to facilitate small-scale light manufacturing and aviation-related industries.

The industrial area should be limited to the Pierce County airport and some adjacent properties.
Industrial activities shall not impact the safety of airport operations.

**GOAL SH LU-23** Allow for commercial retail and service uses within the Employment Center.

Allow smaller parcels along Sunrise Boulevard between Meridian East and 110th Avenue East to be zoned Employment Services.

Parcels rezoned to the Employment Services zone classification should not be greater than 4 acres in size.

Rezones may only be allowed when the following criteria are met:

- A PDD shall accompany all rezone applications; and,
- The proposed uses are compatible with airport operations associated with Thun Field.

Limit the range of allowed uses within the Employment Services.

The range of retail and service uses should complement industrial activity and meet the daily needs of employees and local residents.

Residential uses shall be prohibited within the Employment Service zone.

The type of retail and commercial services allowed should serve a market not greater than South Hill residents and businesses.

Residential and commercial development shall not impact airport operations or the safety of citizens.

Land uses around the airport should not concentrate people or buildings in the airport's safety zones or under the flight path for take-offs and landings at Thun Field.

Expand the Pierce County Airport Area of Influence to reflect safety zones 1-6 as depicted in "Airports & Compatible Land Use, Volume 1," WSDOT, Aviation Division, Revised February 1999.

Any buildings and structures that would penetrate the imaginary airspace surfaces for the Pierce County Airport (Thun Field) as defined in Title 14 CFR (Code of Federal Regulations), FAR (Federal Aviation Regulations) Part 77 "Objects Affecting Navigable Airspace" shall be prohibited.

Encourage natural vegetation to minimize noise impacts from airport operations on the surrounding residential neighborhoods.

Encourage the replacement of low-growing vegetation for noise attenuation in areas where trees are cleared.

**IMPLEMENTING ACTIONS**

The following is a list of actions that need to be completed in order to implement the policies contained within this plan. They are arranged according to the timeframe within which each
should be completed: short, medium, or long term. Short-term actions should occur within one year of plan adoption. Mid-term actions should be completed within 2-5 years. Long-term actions should be completed within 5-10 years of plan adoption. The parties responsible for leading the effort to complete the action item are listed in parenthesis following the action. Actions are assigned to the South Hill Advisory Commission (SHAC), Pierce County Planning and Land Services (PALS), Pierce County Economic Development (EC), Pierce County Parks and Recreations (Parks), Pierce County Public Works (PW), Airport Advisory Committee (AAC), and Tacoma-Pierce County Health Department (TPCHD).

**SHORT TERM ACTIONS**

1. Amend Title 18A to provide incentives for re-development and infill. (PALS, SHAC)
2. Develop and implement a program to provide a visual break, protect resources, and reduce flooding along Meridian. Programs to be considered include:
   - Transfer of Development Rights
   - Current Use Assessment
   - Public Purchase
   - A landscape and restoration program. (PALS, SHAC)
3. Conduct yearly reports that summarize accomplishments and outline recommendations for work items toward the upcoming year. (PALS)
4. Complete regulations and design provisions for small-lot single-family or the High-Density Single-Family residential zone. Regulations shall address:
   - appropriate infrastructure in place prior to occupancy;
   - design features that mitigate and blend high-density with established single-family.
   - possible exception from barrier curb requirements. (PALS, SHAC)
5. Develop and implement incentive based regulations by incorporating a minimum, base, and maximum density for each zone. Developments exceeding base density shall have criteria to exceed the base. A menu of choices shall be provided to allow flexibility. (PALS)
6. Amend Title 18 to require rezone applications to include an analysis of market vacancy and demonstrate a need for rezone. (PALS)
7. Establish an Airport Advisory Committee for Pierce County Airport within one year of plan adoption.

**MID-TERM ACTION**

1. Inventory abandoned, dilapidated, or illegal land uses and institute a program to bring each into compliance or eliminate. (PALS, SHAC)

**LONG TERM ACTIONS**

1. Complete a monitoring report to evaluate the effectiveness of regulations and incentives. (PALS)

South Hill Community Plan
Chapter 3: Community Character and Design Element

**INTRODUCTION**

Community design deals with the physical elements that compose the character of our communities: the streets, parks, buildings, open space, and neighborhoods that determine the way our communities look and feel. It is a blending of land use planning, architecture, landscape architecture, and environmental protection. Community design looks at the way in which buildings, streets, public places, natural features, and other development relate to one another and the people who use them. Through community design, individual improvements, such as street construction, park development, land use regulation and new commercial, industrial, residential and civic development can be effectively coordinated with each other to promote a unified community image.

The way in which people experience their communities and interact with one another is determined, in large measure, by a community’s design. Designs that emphasize community are those that invite human presence and allow for interaction of people. Where design is not a consideration, land use planning and regulation often fail to recognize the functional and visual links between developments. Poorly designed development tends to hinder the development of desired land uses.

While the regulation of appearance and design is often a basic component of urban regulatory systems, it is also one of controversy. Many people feel that such regulation is inherently subjective and hence inappropriate for government. However, design regulation is not only capable of making a substantial difference in the character of a community and its quality of life, but it also plays an important role in how the community perceives itself and how it is perceived by outside visitors.

The Community Character and Design Element is a new addition to the set of documents comprising the Pierce County Comprehensive Plan. The need for a community plan element articulating the desired appearance and character of individual communities is inferred through policies in the 1994 Pierce County Comprehensive Plan and is stressed through public input gathered through the South Hill and other community planning efforts.
The Community Character and Design Element is an integral part of the entire growth management planning process for South Hill. Design directly affects land use patterns, transportation planning and community and neighborhood livability, and overall quality of life. The design policies are intended to establish and reinforce a visual character for South Hill.

The Community Character and Design Element is affected by the Land Use Element which develops policy direction for urban form and, in turn, affects the Land Use Element by providing guidelines for how the urban form can be achieved and critical areas can be integrated into future projects. The design direction found in the Community Character and Design Element is also closely linked with and provides support for policy direction in the Economic, Natural Environment, and Facilities and Services Elements of the community plan.

**DESCRIPTION OF CURRENT CONDITIONS**

As South Hill population increases, the landscape rapidly changes, and many local citizens no longer experience a sense of community. This is a disturbing trend not only for long-time residents who have watched their homeland transform, but also for new residents who seek to raise children with a sense of belonging to a community. Although the true heart of the South Hill community lies in its people, churches, schools, neighborhoods, and activities, there is not a central location that is easily identifiable as the heart or center of South Hill.

Historically, the commercial portions of the plan area have developed absent a consistent design theme or set of design standards. As a result, many of the buildings have standardized franchise themes or, in the case of independent businesses, no theme at all. Without question, South Hill and other communities in Pierce County have developed with incompatible architectural styles that lack consistent character.

Meridian Avenue provides superb views of Mount Rainier, views rarely seen due to the overwhelming signs advertising businesses that are also obstructed by the signs. This proliferation of signs adds to the visual clutter along the Avenue and deteriorates pride in the community.

With the exception of older, established neighborhoods, the existing residential character is void of significant vegetative buffers within and surrounding developments. Significant stands of trees have not been retained and complete removal of understory vegetation has been a common development practice. Until 1998, there were no design standards required for residential development within South Hill. The residential complexion is largely single-family with some duplexes and mobile home parks. There are a few multifamily residential complexes located in the northern portion of the community situated near Meridian Avenue.

Traffic is frequently identified as the number one problem on South Hill. It is difficult to move around the community for numerous reasons. There are very few sidewalks or bicycle pathways that allow movement through the community. Thus the only way to get from one place to another is by car. Everyone is forced to drive.
DESCRIPTION OF DESIRED CONDITIONS

South Hill citizens want a livable community. The South Hill Community Plan enacts measures to ensure future development will contribute to visual and functional amenities. The goals of the community plan are accomplished through policies, regulations, and design standards. However, adoption of the community plan will not result in immediate change. Significant and lasting change will occur over time through the realization of the implementing actions and citizen support.

Nearly all of the policies of the Community Character and Design Element call for long term educational action on the part of citizens. These educational measures may be accomplished through homeowner association discussions, public forums, or school programs.

CENTRAL PLACE

To counteract the lack of a central place or heart of the community, two strategies are proposed. First, the allowance and creation of two Urban Villages along Meridian Avenue would provide a mix of residential and small commercial business interconnected with plazas and pedestrian walkways. These areas are intended to be local community centers where citizens would be likely to meet for coffee, a community gathering, a farmer’s market, or shopping. Plantings, plazas, public art, and other features will be used to create an aesthetically pleasing atmosphere and provide a sense of the community. Secondly, the community plan recognizes the need and importance of a community center in a park-like setting. The property located at 144th and Meridian is recognized as a very desirable setting should it become available.

DESIGN

The South Hill Community Plan integrates the natural and built environments to create neighborhoods and business centers that are functional, visually attractive, and compatible with the natural surroundings. Design standards require new development to

Reduced setbacks, sidewalks, landscaping and architectural features enhance the livability of the community and character of the neighborhood.
demonstrate that filling and grading are minimized, trees are retained or replaced, and pedestrian connections are in place. Landscape standards are increased for parking lots and commercial buildings. Architectural standards are required for small lot residential development. High-density housing will be characterized by houses that accentuate the living area of houses, and de-emphasize carports and garages. Residential areas will feature a variety of architectural features that mute the scale of larger buildings so as to blend with the desired sense of scale for the neighborhood. Covered bus shelters will be required for new residential developments and commercial complexes served by transit.

Building and site design will emphasize safety through effective use of lighting, site design, and landscaping. Within the Urban Village zones, amenities such as courtyards or plazas, benches, artwork, and lighting will be integrated into site design to attract pedestrian uses. Within Community Centers along Meridian Avenue, pedestrian walkways will be distinctly marked through parking and automobile areas.

The apparent scale of multifamily and commercial buildings will be reduced through the design and placement of structures and through the effective use of landscaping. Parking areas will be situated and designed to minimize visibility from streets and the front of buildings.

**Signs**

The South Hill Community Plan sets new standards for signs as a means of enhancing the streetscape of Meridian Avenue and opening potential views. Policies and regulations strive to reduce the number and size of signs. In commercial complexes with multiple businesses, signs will be consolidated to diminish the visual clutter. New pole signs, video signs, flashing or rotating signs will be prohibited.

**Trees**

Trees and vegetation retention are addressed through two methods in the community plan. First, the plan introduces standards for tree retention or replacement. These standards require trees on a site to be retained or replaced with trees similar to the surrounding neighborhood. Trees are also addressed through landscape standards.

**Pedestrian Linkages**

To promote mobility within neighborhoods and throughout the community, a strong emphasis is placed on ensuring pedestrian sidewalks are constructed. Commercial business and
residential developments will construct sidewalks within their developments as well as along the perimeter. Roadways will be separated from pedestrian and bicycle pathways so as to encourage a variety of modes of transportation.

**HISTORIC RESOURCES**

South Hill residents recognize the importance of preserving historic resources. Recently, interested citizens formed the South Hill Historical Society. Efforts are underway to gather data and record the past. Community plan policies and actions promote the efforts of the Historical Society toward preserving historic structures and documents.

**CULTURAL RESOURCES POLICIES**

**SOCIAL AND CULTURAL ACTIVITIES**

**GOAL SH CR-1**  
Build upon current community events by increasing participation and community spirit.

**SH CR-1.1**  
Create a variety and depth of community cultural activities.
Encourage regular cultural events, exhibits, performing series, and festivals that utilize existing public and private facilities.

Support the annual holiday tree lighting in December through attendance and publicity.

Work with community groups to develop an annual festival or community event to occur in the spring or summer.

Utilizing local talent whenever possible, give special attention to the celebration of the community’s heritage and natural history as well as emerging art form and themes.

Work with the local school districts to develop an information distribution system for upcoming cultural events.

Investigate the feasibility of a farmers market associated with South Hill Central Place.

Provide information about South Hill’s cultural activities through systems that will expand public awareness of the arts, heritage, and humanities and promote their value to individuals and the community.

The Pierce County website shall include accessibility to current and newly developed cultural events.

Encourage broad-based community participation to foster the coordination and realization of the Community Character Element.

Record South Hill’s history of settlement and development through restoration and preservation.

Identify and record South Hill’s history and centralize the information in a public location.

Support and work with the South Hill Historical Society to record the history of the area through fundraising, identifying grant opportunities, and attending activities sponsored by the society. The historical society coordinates historic documentation activities, but should be able to look to the Land Use Advisory Commission and County for assistance and support.

Research and acquire a possible site for the historical society to locate information and teach about the history of South Hill.

Coordinate with the historical society and the South Hill Library to retain historical information until a permanent site can be found.

Work with the South Hill Historical Society to identify and inventory historic resources.
SH CR-2.2.3.1 The Pierce County cultural resource inventory should be reviewed and updated for the South Hill area.

SH CR-2.2.3.2 Prioritize properties for placement onto national, state, or local historic registers.

SH CR-2.3 The Blyton Farm cabin should be moved to a carefully selected location that will allow for the cabin to be preserved as a prominent feature in the community.

SH CR-2.4 Actively pursue the opportunity to link the South Hill Heritage Corridor with the Naches Trail from Walla Walla to Steilacoom.

SH CR-2.5 Work with the local school districts to integrate South Hill history into the curriculum.

SH CR-2.6 The South Hill Land Use Advisory Commission should be afforded an opportunity to provide input into the review process when a nomination application for a property located in the South Hill community to the Pierce County Register of Historic Places is filed with the Pierce County Landmarks Commission.

**Design and Character Policies**

**Goals**

We envision a changing landscape with design components that create a safe and attractive urban environment while preserving pockets of country-like settings. We see new developments landscaped into the natural environment instead of overpowering it. Also, the natural landscape is restored or incorporated as existing developments are improved or redeveloped. We envision a community that is cohesive both in terms of design and transportation connections such as safe streets, sidewalks, and trails.

**Site Design**

**Goal SH D-1** Ensure consideration is given to the natural site characteristics before designing or planning developments to ensure trees, views, energy-efficient design, and open space are incorporated into developments.

SH D-1.1 Natural resources and site characteristics determine the site layout of proposed developments.

SH D-1.2 Site design should work in conjunction with the natural site contours.

SH D-1.3 Minimize the amount of grading and filling on a site.

SH D-1.4 Allow stormwater facilities to be designed as a site amenity. Landscaping, hedges, wrought iron fencing, or placing a fountain in the pond are encouraged and considered site amenities. Non-decorative fencing, such as chain-link or wood is not considered a site amenity and at a minimum shall be shielded from view of neighboring properties by planting vegetation along the perimeter.
SH D-1.5 Ensure post-development site hydrology closely mimics the hydrology of the site prior to the development.

SH D-1.5.1 Minimize impermeable surfaces and site disturbances.

SH D-1.5.2 Provide incentives for residential design that incorporates low impact development techniques.

SH D-1.6 Reduce natural resource consumption in site design and building features.

SH D-1.6.1 Encourage the use of alternative site and building design through the use of incentives.

SH D-1.6.2 Design infrastructure systems to optimize efficient use of natural resources.

SH D-1.6.2.1 Re-use or connect to existing systems.

SH D-1.6.2.2 Consider alternative stormwater collection and retention methods.

GOAL SH D-2 Retain or restore stands of trees within the community.

SH D-2.1 New developments shall incorporate trees and vegetation in keeping with Pacific Northwest vegetation.

SH D-2.2 Clear-cutting a site and replacing the trees with homes and only decorative vegetation, such as flowering cherry or vine maple, is unacceptable.

SH D-2.3 Some portion of the site must contain stands of tall evergreen trees.

SH D-2.3.1 These trees may be retained at the time of development or planted to reach maturity within a reasonable time frame.

SH D-2.4 Provide flexible standards for on-site tree retention, restoration, and replacement. Standards or regulations should be flexible to allow for situations where placement of existing trees limits building capabilities of the site.

SH D-2.4.1 Tree retention should occur in a clustered format to limit exposure and potential safety hazards during windstorms.

SH D-2.4.2 The developer should replant trees on sites that have been completely logged.

SH D-2.4.2.1 Trees may be clustered in open space, park or recreation areas, or within a significantly landscaped perimeter of the development.

SH D-2.4.3 Trees restored on-site shall be capable of growing to significant heights.

SH D-2.4.3.1 New trees should be at least 8 feet in height, 2 inches in diameter, and fully leafed at the time of planting and capable of a minimum height of 35 feet at maturity, except where conflicts occur with utility or aviation corridors.

SH D-2.4.4 Allow selected limbing of trees so that significant views are not obscured.

SH D-2.4.5 Native or drought-tolerant species should be used to reduce watering needs.
Tree retention replacement regulations shall not apply to individual single- or two-family building lots.

However, single- and two-family property owners are encouraged to replace fallen or downed trees.

Vegetation coverage and tree retention requirements should focus on post-construction safety and site enhancement.

Vegetative plantings of trees and shrubs should be used in subdivisions in place of fences to separate homes and neighborhoods.

To promote tree retention and integration of the natural environment while buffering homes from noise and glare, residential subdivisions, multifamily, and manufactured home parks shall contain a landscaped buffer around the perimeter. Provisions shall be made to allow adjacent subdivisions to reduce or forego the buffer in locations where amenities such as shared recreational areas or trails are provided.

The width of the perimeter vegetation buffers for new residential developments along 70th Avenue/Woodland Avenue, 86th Avenue E., 94th Avenue E., Shaw Road, Military Road, 122nd Avenue, 112th St. East, 122nd St. East, 128th St. East, 136th St. East, 144th St. East, 152nd St. East, 160th St. East, 176th St. East, Sunrise Boulevard, Sunrise Parkway, Meridian Avenue between 176th St. East and 187th St. East, and State Route 512 shall be sized to mitigate air and noise impacts from high levels of automobile traffic.

Include language on the plat and in conservation easements, signage, and homeowner covenant maintenance agreements that requires post-construction protection for designated native vegetation areas.

Require developments to present a composite site analysis that overlays soil, slopes, wetlands, streams, and other natural features to retain native vegetation to the greatest extent.

Tree stands on and adjacent to steep slopes shall be retained.

Require commercial developments, subdivisions, and multifamily developments to provide tree retention or replacement.

Require development sites that are unable to meet the minimum tree canopy cover retention percentage to be planted or replanted as necessary to achieve the desired tree canopy cover within 10 years.

Require a bond prior to final plat approval to ensure developments are built-out with the required landscaping. The amount of the bond shall cover the potential overhead costs that Pierce County may experience in the employment of a third party to plant the required vegetation retention or replacement.

Provisions shall be made to allow for removal of dead or diseased trees or trees that pose a safety hazard.
Residential

SH D-3.11 Provisions shall be made to ensure that newly planted trees survive through the first year.

GOAL SH D-4 Residential development shall be designed to be inviting and vibrant.

SH D-4.1 Design and integrate new residential subdivisions, plats, multifamily dwellings, and manufactured home parks with the natural characteristics and resources of the site as well as the surrounding neighborhood.

SH D-4.2 Develop flexible design requirements that allow for innovation in integrating the natural environment with varied densities, including exceeding the standard density, if the development surpasses minimum requirements.

SH D-4.3 Provide incentives for innovative site designs that cluster residential uses to preserve a larger area of the native environment and provide open space amenities.

SH D-4.4 The site layout, orientation, and building mass of multifamily complexes should be designed in a manner that does not change the character of the surrounding residential neighborhood.

SH D-4.5 Consider requiring of a percentage of single-family homes to be integrated with apartment complexes to mix multifamily into surrounding neighborhoods and avoid a mass of apartment complexes.

SH D-4.6 High density single-family residential developments should have ground floor entries.

GOAL SH D-5 Promote safe and defensible neighborhoods through eyes on the street site design concepts.

SH D-5.1 Building and site design should encourage personal safety by:

SH D-5.1.1 Using site planning techniques;

SH D-5.1.2 Giving residents more control over the space adjacent to their homes (increased territoriality);

SH D-5.1.3 Increasing opportunities for neighbors and those passing by to keep an eye on nearby activities; and

SH D-5.1.4 Using design and construction approaches to reduce vandalism.

GOAL SH D-6 Provide recreational areas and/or open space areas of a size and use suitable for a variety of activities in all new residential subdivisions, multifamily complexes or mobile/manufactured housing parks.

SH D-6.1 Provide opportunities to recreate, play, or relax outdoors.

SH D-6.2 Flexible regulations shall be developed to ensure that new, small-lot residential subdivisions, multifamily complexes or manufactured housing parks include a recreational area.
SH D-6.3  If a local park and recreation district or park and recreation service area is formed, a fee may be provided to the district or area in lieu of constructing an on-site facility.

SH D-6.4  Recreational areas shall be functional spaces that can be viewed from neighboring homes.

SH D-6.5  Recreational areas should be interconnected with green spaces that preserve natural features such as wetlands, forests, tree stands, and views.

SH D-6.6  Fences between recreational areas and open space shall be minimized.

SH D-6.7  Recreation areas shall include at least one of the following:

   SH D-6.7.1  Tot lots with traditional play equipment such as swings, slides, and other play equipment such as interactive artistic forms;

   SH D-6.7.2  Formal playgrounds with basketball courts, tennis courts, and baseball diamonds;

   SH D-6.7.3  Other sport-oriented play areas;

   SH D-6.7.4  Jogging and exercise trails in the form of common dedicated greenbelt backyards; or

   SH D-6.7.5  Open green spaces with enough room for children to play and benches or picnic tables to allow close supervision.

SH D-6.8  New developments shall be required to provide open space. Active recreation areas are not counted toward the open space requirement. Areas counted as open space are:

   SH D-6.8.1  Critical areas, buffers, and other spaces permitted by the Pierce County Comprehensive Plan;

   SH D-6.8.2  Landscaped stormwater ponds without fences; or

   SH D-6.8.3  Gathering places and passive recreation areas.

SH D-6.9  Recreational areas should be landscaped with native vegetation.

SH D-6.10  Large recreational areas and open space tracts are priority.

SH D-6.10.1  An incentive-based system shall encourage the development of significant, contiguous park and open space tracts while discouraging the smaller tracts that are not as conducive to recreational activities.

COMMERCIAL AND CIVIC

GOAL SH D-7  Include commercial and civic sites that incorporate natural characteristics and invite people to utilize the property or patronize the business.

SH D-7.1  Design commercial and civic sites to integrate the natural features of the site while providing orderly and safe pedestrian circulation.
SH D-7.2 Require pedestrian connections between the proposed use and the street for all structures that face public streets. Satellite buildings should have pedestrian connections across parking areas to the principal structure or anchor store.

SH D-7.3 Ensure delivery areas are incorporated into site design in a manner that minimizes the impacts of these activities on adjacent sites.

SH D-7.4 Require multifamily complexes and commercial/industrial sites to provide adequate, accessible storage and collection locations for recyclable materials.

SH D-7.5 Site plan review for commercial businesses, manufacturing, and light industrial uses shall take into account potential negative impacts on nearby uses.

SH D-7.6 Provide pedestrian-scaled, direct lighting that illuminates walkways, increases safety, highlights buildings and landmark elements, and provides sight line to other retail uses such as a view from a café to unique shops.

ARCHITECTURAL DESIGN

GOAL SH D-8 To ensure quality development, increase predictability and set a high standard for development within the South Hill community to avoid being a generic suburban area.

SH D-8.1 Ensure that architectural designs of non-residential or multifamily complexes located adjacent to single- and two-family neighborhoods do not detract from the residential character of the established neighborhoods.

SH D-8.2 Use techniques such as building placement, architectural design, and landscape design to reduce the perceived bulk and scale of non-residential and multifamily structures that are located adjacent to residential neighborhoods.

RESIDENTIAL AND ACCESSORY STRUCTURES

GOAL SH D-9 Design homes that facilitate interaction between residents.

SH D-9.1 Use design features to encourage interaction and reduce impacts of small lot development.

SH D-9.2 Front doors, windows, and walkways should be emphasized on residential buildings; garages should not be emphasized in appearance.

SH D-9.3 Garage placement shall not be located closer to the street front than the porch or front door on small lots.

SH D-9.4 Provide opportunities for reduced front yard setbacks to accommodate porches and decks while placing the garage further back or behind the home.

SH D-9.5 Allow rear yard alley access. Alleys should be constructed for one-way traffic flow to reduce impervious surfaces.

SH D-9.6 Provide incentives for architectural design standards.
SH D-9.7  Driveway length should allow adequate space for parking cars without blocking sidewalks.

SH D-9.8  Mailbox structures shall include rain covers or roofs and should be complementary to the rest of the development in color and design.

SH D-9.9  Encourage lockable mailboxes.

SH D-9.10 Reduce the impacts of small lot development through architectural and site design.

GOAL SH D-10 Design multifamily units that depict an inviting and vibrant living environment.

SH D-10.1 Avoid locating off-street parking areas for multifamily development between the buildings and the street.

SH D-10.2 Allow the residential units to be oriented toward the street or toward a common space instead of a parking lot.

COMMERCIAL AND CIVIC

GOAL SH D-11 Create attractive walkways and street front experiences maximizing the quality of the pedestrian environment and the opportunities for retail shopping.

SH D-11.1 Design shop fronts to shelter pedestrians from the rain.

SH D-11.2 Street-facing building facades shall employ a variety of measures including window and entrance treatments, overhangs and projections, and innovative use of standard building materials and landscaping to increase visual interest and visually break up large building mass.

SH D-11.3 Provide distinctive building entries through the use of distinctive architectural features.

SH D-11.4 Strive for architectural excellence, higher quality building design, and retail-friendly first floor facades.

SH D-11.4.1 Deter crime by designing for security; ensure street-level vitality and plenty of eyes on the street.

SH D-11.4.2 Vary roof pitch and façade designs since retailers depend on diverse, appropriately- scaled, and customized shop fronts.

SH D-11.4.3 Discourage nondescript architecture that has few design features, lacks cohesiveness, or is scaled to be appreciated at automobile speeds.

SH D-11.4.4 Within a given commercial or civic development, require consistent architectural themes and colors for buildings, street furniture, and amenities.

SH D-11.4.5 Civic buildings and uses such as libraries, parks, or government offices shall be of exemplary design to serve as anchors for other developments in the district and to demonstrate the architectural excellence of the community.

SH D-11.4.6 Buildings constructed with public monies shall contain some form of public art and/or public gathering space.
**INDUSTRIAL**

**GOAL SH D-12**
Integrate industrial and business uses into the natural environment and community.

**SH D-12.1**
Ensure professional offices or manufacturing companies contain appropriate lighting, landscaping, and traffic and noise buffers to blend with the community.

**SH D-12.2**
The preferred method of noise attenuation is landscaping. Where fencing or other structural methods are used, landscaping shall be provided.

**SH D-12.3**
Cell towers shall be constructed and painted to blend with the surrounding environment.

**NEIGHBORHOOD COMMERCIAL**

**GOAL SH D-13**
Ensure that the design and location of neighborhood commercial development within South Hill is consistent with the character, scale, and identity of the neighborhood.

**SH D-13.1**
Neighborhood commercial development should directly serve the needs of the local community providing the necessary goods and services.

**SH D-13.2**
Ensure that commercial development is limited and proportionately interspersed with other community-oriented services such as schools, branch libraries, open space, and parks.

**SH D-13.3**
Select Neighborhood Centers that are appropriate for the surrounding community and complement adjacent residential uses.

**SH D-13.3.1**
Neighborhood character should be recognized and preserved through the preparation of design standards and guidelines for development within Neighborhood Centers.

**SH D-13.3.2**
Standards should prohibit the development of regional-scale commercial uses within Neighborhood Centers.

**SH D-13.4**
Establish and implement consistent requirements for all new neighborhood commercial development.

**SH D-13.4.1**
Pierce County shall establish design guidelines and standards for development within Neighborhood Commercial areas.

**SH D-13.4.2**
Apply height limitations within the Neighborhood Centers consistent with adjacent single-family residential districts to complement the surrounding residential uses and maintain the human scale of the neighborhood.

**SH D-13.4.3**
Ensure architecture is consistent or harmonious in character with single-family residential uses through the use of color, materials, textures, and landscaping. Development within Neighborhood Commercial areas should enhance the identity of the neighborhood.
SH D-13.4.4 Require parking for employees in the back or on the side of the building which shall include landscape screening. Require angled on-street parking (not located within the right-of-way) within Neighborhood Commercial areas to avoid the construction of parking lots adjacent to single-family residential neighborhoods.

SH D-13.4.5 Require new commercial development to adhere with the same impervious surface requirements as adjacent single-family residential uses.

SH D-13.4.6 Require street trees and landscaping along rights-of-way consistent with requirements in single-family residential districts to minimize the effect of the Neighborhood Commercial uses on adjacent residential neighborhoods.

SH D-13.4.7 Require new development within Neighborhood Commercial areas to provide a transition zone to the sidewalk that enhances the quality and feeling of the connection to the street. The connection to the street is enhanced through facing many windows and doors toward the street, and through the use of window displays and details like potted plants and awnings.

SH D-13.4.8 Pierce County shall adopt sign regulations to ensure signs are of a size and scale harmonious to single-family residential uses. Signs shall not be permitted to remain lit during non-business hours.

SH D-13.4.9 Pierce County shall amend lighting requirements to ensure that Neighborhood Commercial areas do not cast light onto adjacent properties and roads.

SH D-13.4.10 Neighborhood Commercial districts shall be required to use amber lighting.

SH D-13.4.11 Sidewalks shall be installed within Neighborhood Commercial districts.

SH D-13.4.12 Site layout and building orientation shall be designed to encourage pedestrian access and circulation.

SH D-13.4.13 Design standards shall include methods to reduce noise, light, and glare so that surrounding residential uses are not impacted.

**Landscape Design**

**GOAL SH D-14** Use creative landscaping to calm traffic, attractively screen service areas, minimize the impact of parking lots, and revitalize the natural environment.

**SH D-14.1** Require a landscaped area between the traffic and the sidewalk that includes elements, such as mature trees that provide shade. The purpose of the landscaped area is to provide shade to pedestrians and to provide a safe buffer between pedestrians and the street. Landscaping shall not inhibit driver sight distance or visibility.

**SH D-14.2** Newly planted landscaped strips shall contain trees that are at least 8 feet tall and 2 inches in diameter.
SH D-14.2.1  Trees must be a minimum of 35 feet at maturity, except where conflicts occur with utility or aviation corridors.

SH D-14.3  Provisions shall be made to ensure that newly planted trees survive through the first year.

SH D-14.4  Trees that serve to assist in noise reduction for commercial or industrial properties shall contain foliage throughout the year.

SH D-14.5  Landscape Meridian Avenue with trees, plants in the median, and lush green areas along its edges.

SH D-14.5.1  New trees should be at least 12 feet in height and 3 inches in diameter and capable of a minimum height of 35 feet at maturity.

SH D-14.6  Encourage the use of bioretention swales in parking lots’ landscaped areas to break up the expanse of asphalt and assist in stormwater treatment and infiltration.

SH D-14.7  Parking lot landscaping shall be significant and dispersed throughout the lot to provide shade, pedestrian refuge, and visual relief.

SH D-14.8  Parking lot vegetation should consist of native trees and vegetation.

SH D-14.8.1  New trees should be at least 8 feet in height and 2 inches in diameter and capable of a minimum height of 35 feet at maturity, except where conflicts with utility corridors or aviation corridors would occur.

SH D-14.9  Where commercial or industrial land uses abut residential uses, a landscaped buffer shall be provided to reduce noise and glare impacts.

SH D-14.10  Vegetation that is native to the Pacific Northwest and that is drought tolerant is preferred for landscaping.

SH D-14.11  Develop a threshold that would require commercial renovations to meet landscape standards for perimeter and interior site plantings.

SH D-14.12  Increase the amount for the landscaping bond required prior to final plat approval to ensure developments are built-out with the required landscaping.

SH D-14.12.1  The increase of the bond shall cover the potential overhead costs that Pierce County may experience in the employment of a third party to plant the required landscaping.

**SIGN DESIGN**

**GOAL SH D-15**  Establish and implement uniform and balanced requirements for new signs and an amortization schedule for the removal of signs made nonconforming by the adoption of regulations implementing this plan.

**SH D-15.1**  Incentives should be provided to bring existing signs into conformance with new codes.
SH D-15.1.1  Incentives should include tax credits or dismissal of permit fees for replacing the sign prior to the assigned sunset date.

SH D-15.2  Billboards should have an amortization period consistent with the Internal Revenue Service depreciation schedule.

SH D-15.3  Aggressively seek nuisance abatement to eliminate problems that inhibit the goals of the districts and the community.

SH D-15.3.1  Pierce County shall identify dilapidated, abandoned, and illegal signs for future abatement action.

SH D-15.4  Ensure that temporary signs are promptly removed after the culmination of the event described or symbolized on the sign.

GOAL SH D-16  Ensure that all signs undergo design review so that the design and placement of signs is consistent with the South Hill design standards and guidelines.

SH D-16.1  Ensure that signage complements, rather than dominates or intrudes upon, the character and visual amenity of an area, the buildings on which they are displayed, and the general environment.

SH D-16.2  Ensure that signage is integrated with the overall architectural framework and structural elements of the building, reinforcing the shape and proportion of the facade through such techniques as detailing, use of colors and materials, and placement.

SH D-16.3  Prohibit the use of flashing or rotating signs, video signs, roof signs, railing signs, and signs attached to private light standards.

SH D-16.4  Prohibit the use of lights and surfaces that result in glare onto adjacent properties.

SH D-16.5  Prohibit the use of pole signs by allowing them only where an applicant can demonstrate that a monument sign is a hardship.

SH D-16.6  Allow monument and wall signs.

SH D-16.7  Allow more than one monument sign on a property if more than 20 businesses are located on the property.

SH D-16.8  Require consolidation of signage within commercial development to reduce visual clutter along streets and the freeway.

SH D-16.9  Prepare standards that limit overall signage to a proportion of the length of the building façade.

SH D-16.10  Prohibit canvas canopy signs and canopy signs that are backlit.

GOAL SH D-17  Minimize the use of off-premise signs within South Hill.

SH D-17.1  Restrict the use of off-premise signs to temporary applications such as the directional signage used to identify real estate open houses and garage sales.

SH D-17.2  Prohibit new billboards in South Hill.
GOAL SH D-18  Enable individuals, businesses, and community groups to promote temporary activities to the wider community through the adoption of clear regulations governing the use, size, and allowed duration of temporary signs.

SH D-18.1  Banners should be of a style, size, and color that complement the surrounding environment and standard on which they are affixed.

SH D-18.1.1  Consider whether or not the structures the banners are being suspended from can support the weight and the force of the wind upon the banners.

SH D-18.2  Commercial center banners must be promoting primarily the commercial center on which they are displayed.

SH D-18.2.1  Specific advertising of businesses or merchandise is prohibited.

SH D-18.3  Temporary signs that are placed within a permanent structure, such as on private light standards, shall be prohibited.

SH D-18.4  Prohibit temporary signs that are affixed to a utility pole unless expressly reviewed and approved by the utility provider.

LIGHTING DESIGN

GOAL SH D-19  Provide consistent lighting regulations that control placement, style, type, and intensity.

SH D-19.1  Provide lighting that is integrated with the overall architectural concept in scale, detailing, use of color and materials, and placement.

SH D-19.2  Integrate the design and placement of exterior lighting with the architectural design and materials of on-site buildings, overall site character, and surrounding neighborhood.

SH D-19.3  Require lighting to be reviewed during design review in all new developments.

SH D-19.4  Encourage amber lighting instead of fluorescent lighting.

SH D-19.5  Provide adequate lighting levels in all pedestrian areas including building entries, along walkways, parking areas, along transit corridors and at transit stops, and other public areas.

SH D-19.6  School bus stops should be lit and safe. The school district should plan the stops, and developments should contribute to construction and safety.

GOAL SH D-20  Encourage all non-essential exterior commercial and residential lighting be turned off after business hours and/or when not in use.

SH D-20.1  Encourage the use of lights on a timer.

SH D-20.2  Encourage the use of motion-activated lighting for security purposes.

SH D-20.3  Encourage parking area lights to be greater in number, lower in height and lower in light level, as opposed to fewer in number, higher in height, and higher in light level.
SH D-20.4 Parking lot lighting shall not exceed Illuminating Engineering Society of North America recommended lumens.

SH D-20.5 Ensure lights within the Pierce County Airport’s area of influence meet Federal Aviation Administration (FAA) standards.

GOAL SH D-21 Reduce the amount of lighting and glare onto adjacent sites and roads.

SH D-21.1 Establish standards that curtail lighting and glare from intruding onto adjacent properties and into the night sky. Lighting standards shall provide a ceiling for all developments. Developments may deviate from the standard only when it can be demonstrated the extra lighting is necessary and impacts onto adjacent properties, roads, and the night sky will be minimized.

SH D-21.2 New commercial and industrial businesses, residential subdivisions, and multifamily development shall be required to meet the minimum lighting standards necessary for security and working purposes; the development shall minimize potential pollution from glare and spillage particularly to:

- Residential and commercial areas;
- Areas of nature conservation interest, and wildlife or open space corridors; and
- Areas whose open and remote landscape qualities would be affected, including observatories.

SH D-21.3 Artificial light from commercial businesses and signs shall not be directed into the night sky, toward the road, or toward neighboring properties.

SH D-21.4 Commercial properties such as car sales or mobile home sales shall be subject to the same standards as other commercial developments.

SOUTH HILL CENTRAL PLACE

GOAL SH D-22 Through policy, design, and land use regulations, create an urban core or central place that is a focal point for the South Hill community.

SH D-22.1 Include a central place or business district with a vibrant mix of residential, commercial, and civic uses.

SH D-22.2 Plan, zone, and adopt design standards for South Hill Central Place to facilitate vertical mixed use of three or more stories and to achieve pedestrian concentrations that create a lively, safe, attractive, and entertaining streetscape.

- The South Hill Central Place shall be the focal point for pedestrian-scale retail, services, entertainment, civic, and arts center for the community.

- Allow flexible height standards that encourage vertical development.

- South Hill Central Place should have a strong pedestrian and transit orientation that is reflected in site development and design standards.
SH D-22.2.4 Allow significantly higher densities in South Hill Central Place.

SH D-22.2.5 All developments within South Hill Central Place should contribute proportionate funding to an open space area or park within the Central Place.

SH D-22.2.6 Outdoor seating areas should be encouraged within South Hill Central Place.

SH D-22.2.7 Street furniture, artwork, lighting, planter boxes, canopies, and other architectural or site detailing should be required in South Hill Central Place.

SH D-22.2.8 The mix of commercial, civic, and residential activities should be linked with plazas, walkways, and outdoor areas thereby providing an innovative atmosphere and identity that is uniquely South Hill.

SH D-22.2.9 Individual developments within the Central Place shall integrate public spaces, art, and pedestrian circulation in its site design and/or building orientation.

SH D-22.2.10 Development within the Central Place shall be designed in such a manner that residents from the surrounding neighborhoods can access the area through pedestrian paths, bicycles, and transit.

SH D-22.3 Allow mixed use development within South Hill Central Place. Mixed use developments may contain retail, office, and residential uses within a building or complex of buildings. Mixed use developments can reduce vehicular trips, more efficiently use land, and provide concentrations of customers who live or work in the area. Mixed use developments can benefit other businesses and provide opportunities for uses, such as transit and other civic and cultural uses, which might otherwise be difficult to accommodate in the South Hill community.

SH D-22.3.1 South Hill should encourage mixed uses in South Hill Central Place. Mixed use developments shall be designed to encourage compatibility among the on-site uses and with adjacent land uses.

SH D-22.3.2 Uses that are inconsistent with the intent of South Hill Central Place shall not be allowed. These include industrial uses, automobile repair services, and other uses that are suitable only for patronage via automobile.

SH D-22.4 Encourage site design supporting a mixed use, pedestrian-oriented district.

SH D-22.4.1 Develop and adopt a preferred conceptual streetscape layout for the location of buildings, open space, utilities, and amenities.

SH D-22.4.2 Provide incentives for the implementation of the conceptual site layout.

SH D-22.4.3 Permit deviation to the conceptual layout and incentives if specific design criteria are met.
**GOAL SH D-23** Recognize that views of Mount Rainier are one of the amenities of South Hill, and enhance the image and enjoyment of the community by making the views more prominent and public. This section also encourages public art in site or architectural design. The policies are intended to emphasize the importance of these aesthetics without creating burdensome regulations.

**SH D-23.1** Preserve views of Mount Rainier and include public art through site design.

**SH D-23.2** Create opportunities for viewpoints in South Hill where significant views exist within the community.

**SH D-23.2.1** Where significant views occur, encourage development to recognize and preserve public views on the site.

**SH D-23.2.2** Create better viewpoints by terminating the road at the viewpoint or creating a park or recreational area where views occur.

**SH D-23.2.3** Preserve the views of Mount Rainier, Orting Valley, and open space areas in the valley below 86th Avenue East.

**SH D-23.2.4** Work with Pierce County Recycling, Composting, and Disposal (PCRC), the Tacoma-Pierce County Health Department, the Washington State Department of Ecology, and the United States Environmental Protection Agency to develop a wider array of compatible future uses for the landfill site which would include establishing scenic vistas.

**SH D-23.2.5** When 176th is extended east toward Orting, the alignment should be developed to maximize scenic viewing opportunities through the use of design concepts such as pullouts.

**SH D-23.2.6** Scenic vistas should be considered for the vicinity of 77th Avenue and 114th Street.

**SH D-23.2.7** Identify other key vistas that should be scenic viewpoint locations.

**SH D-23.2.8** Roads should be aligned to capture views where possible.

**SH D-23.2.9** Pullouts should be included in prime view areas.

**SH D-23.3** Enhance views and create viewpoints along Meridian Avenue.

**SH D-23.3.1** Recognize that the visual quality of Meridian Avenue, as the main thoroughfare, can produce pride in local residents.

**SH D-23.3.2** Establish a scenic viewpoint in the vicinity of 156th Street East and Meridian Avenue.

**SH D-23.3.3** Developments along Meridian Avenue should create positive visual diversity by providing public viewing opportunities where possible.
**PUBLIC ART**

**GOAL SH D-24** Encourage various art forms and public displays of art as a means to invoke appreciation and thought.

**SH D-24.1** The incorporation of artwork in the South Hill community helps articulate diverse social values and enhances the aesthetic qualities of the natural and built environment.

**SH D-24.2** Encourage the use of artwork as a means of introducing beauty and thought into the common day.

**SH D-24.3** Provide incentives for development to include public artwork.

**SH D-24.4** Work with local art groups for the display of art.

**SH D-24.5** Partner with the school districts and Pierce College for artistic display.

**SH D-24.6** Recognize important community figures when dedicating public art.

**SH D-24.7** Work with the school districts and local artists to develop a community logo.

**SOUTH HILL ENTRANCES**

**GOAL SH D-25** Provide design concepts and policies that will create attractive entrances to the South Hill community.

**SH D-25.1** Create identifiable boundaries, entries, and gateways for South Hill and its neighborhoods so that residents, workers, and visitors know they are entering the community.

**SH D-25.2** Provide distinctive designs at the edges of or entrances to South Hill.

**SH D-25.3** Use a variety of measures to create distinct entrances, e.g., landscaping, tree planting, graphics, signage, lighting, monuments, brick pavers, colored or stamped concrete, and public art.

**SH D-25.4** Recognized entries consisting of tree plantings, landscaping, special architectural features, and signage should be established at the following locations to create entrances into the community:

- **SH D-25.4.1** 116th or 120th Street East and Meridian Avenue;
- **SH D-25.4.2** 116th Street East and 94th Avenue;
- **SH D-25.4.3** 176th Street East and Meridian Avenue;
- **SH D-25.4.4** 112th Street East and Woodland Avenue;
- **SH D-25.4.5** 128th Street East and Woodland Avenue;
- **SH D-25.4.6** Military Road East from the Orting Valley;
- **SH D-25.4.7** SR 512 and 70th Avenue;
SH D-25.4.8  176th Street East and 86th Avenue;
SH D-25.4.9  160th Street East and 70th Avenue;
SH D-25.4.10 116th Street East and 86th Avenue;
SH D-25.4.11 122nd Street East and 110th Avenue; and
SH D-25.4.12 112th Street East and Shaw Road.

SH D-25.5  Pierce County shall support and assist the community in developing and maintaining the entrances.

SH D-25.5.1  Support and assistance may be in the form of grant writing, developing a landscape plan, working with the business community, and other methods to solicit interest in the development of the entrances.

---

**DESIGN STANDARDS AND REGULATIONS REVISIONS**

**GOAL SH D-26**  Outline the regulatory measures that will accompany the plan and identify potential missing items.

**SH D-26.1**  Identify regulatory measures necessary to achieve the desired visions and goals of the South Hill Community Plan.

**SH D-26.2**  Develop flexible and understandable design standards and guidelines to achieve the goals set forth in the Community Character Element of this plan.

**SH D-26.2.1**  The design standards and guidelines shall be flexible and offer the end user a menu of choices that achieve the desired outcomes.

**SH D-26.2.2**  The design standards and guidelines shall be easy to understand and implement.

**SH D-26.2.3**  Develop flexible design standards and a menu of choices to connect new developments to other neighborhoods and community assets.

**SH D-26.2.4**  Design standards shall provide a menu of choices for providing connections.

**GOAL SH D-27**  Ensure regulatory amendments that implement this community plan are completed.

**SH D-27.1**  Community residents, business representatives, and the County should work diligently to identify and remove barriers to achieving the policies and action steps listed throughout this element.

**SH D-27.2**  The County shall revise parking regulations to:

**SH D-27.2.1**  Allow shared parking facilities;

**SH D-27.2.2**  Reduce the number of spaces required; and

**SH D-27.2.3**  Allow on-street parking for minor arterials and residential streets.

**GOAL SH D-28**  Create a community group that is responsible for the implementing actions contained within the community plan.
SH D-28.1  Ensure a community group is put into place or assigned the duty of implementing the actions of the community plan.

SH D-28.2  The South Hill Land Use Advisory Commission should be responsible for coordinating and implementing the short, mid, and long-term actions of the community plan.

SH D-28.3  Consider expanding the South Hill Advisory Commission or assigning subcommittees to complete the tasks, monitor the plan, and request amendments.

IMPLEMENTING ACTIONS

The following is a list of actions that need to be completed in order to implement the policies contained within this plan. They are arranged according to the timeframe within which each should be completed: short, medium, or long term. Short-term actions should occur within one year of plan adoption. Mid-term actions should be completed within 2-5 years. Long-term actions should be completed within 5-10 years of plan adoption. The parties responsible for leading the effort to complete the action item are listed in parenthesis following the action. Actions are assigned to the South Hill Advisory Commission (SHAC), Pierce County Planning and Land Services (PALS), Pierce County Economic Development (EC), Pierce County Parks and Recreations (Parks), Pierce County Public Works (PW), Airport Advisory Committee (AAC), and Tacoma-Pierce County Health Department (TPCHD).

SHORT TERM ACTIONS

1. Develop and adopt flexible, incentive-based regulations that provide bonus densities when natural site characteristics are preserved beyond standard requirements or low impact development techniques are utilized. (PALS, SHAC)
2. Develop and adopt incentive-based regulations for residential developments that cluster housing and preserve a significant area of open space. (PALS, SHAC)
3. Develop and adopt flexible regulations requiring adequate recreational areas for residential developments to ensure recreational areas are landscaped with native vegetation. (PALS, SHAC)
4. Develop and adopt incentives for small lot development. Amenities must be provided to mitigate for impacts. (PALS, SHAC)
5. Develop and adopt regulations that integrate single-family homes into areas that allow for high-density apartments. (PALS, SHAC)
6. Develop flexible regulations that allow options for vegetation plantings instead of fences. (PALS)
7. Develop and implement a landscape plan for Meridian Avenue. (PALS, WSDOT)
8. Work with the South Hill Land Use Advisory Commission to implement the community plan. (PALS)
9. Amend parking standards to:
   • allow on-street parking for minor arterials and residential streets; and
• ensure senior housing does not require the same amount of parking as other residential uses. (PALS)

10. Develop and adopt criteria that would permit pole signs in hardship circumstances. (PALS, SHAC)

11. Within one year of plan adoption, complete an inventory of the location and condition of all billboards within South Hill. (PALS)

12. Within one year of plan adoption, review and recommend revisions to the design standards for the Mixed Use District (MUD) and Employment Center (EC) zones if necessary. (PALS, SHAC, AAC, PW)

13. Inventory existing business signs for location and condition. (PALS)

14. Investigate the possibility of increasing the bond amount for landscaping to ensure landscaping is planted. (PALS, PW, SHAC)

15. Investigate the possibility of allowing rear yard alley access development in Pierce County. Alleys should be constructed for one-way traffic to reduce impervious surfaces. (PALS, PW, SHAC)

**Mid-term Actions**

1. Develop and adopt an incentive-based regulatory program that promotes alternative energy sources and design. (PALS, SHAC)

2. Amend Title 18 to require design standards for cell towers. (PALS, SHAC)

3. Develop and adopt a preferred conceptual streetscape layout for the Central Place:
   • provide incentives for the implementation of the site layout; and
   • permit deviation to the conceptual layout if specific design criteria are met. (PALS, SHAC)

4. Research and pursue a possible site for the Blyton Farm cabin (Historical Society, SHAC)

5. Work toward the creation of community entrances at identified locations. (PALS, SHAC)

6. Facilitate landscaping and maintenance improvements along Meridian Avenue through coordination and cooperation with community service organizations and the business community. (PALS, SHAC, Community Development)

7. Explore the possibility of creating a local park or recreation district whereby a fee may be contributed to the district in lieu of constructing an on-site facility. (PALS, Parks, SHAC)

**Long-term Actions**

1. Work with appropriate agencies to establish a scenic vista area at the landfill site. (PALS, Pierce County Recycling, Composting and Disposal, SHAC)

2. Establish a scenic viewpoint near 156th and Meridian. (PALS, SHAC)

3. Develop and adopt an incentive program to include art into developments. (PALS, SHAC)

4. Expand community awareness and identity through:
   • working with community groups to develop spring or summer festival
• establishing a farmer's market
• distributing community information through local schools. (SHAC)

5. Pursue the opportunity to link the South Hill Heritage Corridor with the Naches Trail. (Historical Society, SHAC)

6. Work with the local school districts to integrate South Hill history into the curriculum. (Historical Society, SHAC)
Chapter 4: Natural Environment Element

INTRODUCTION

The Natural Environment Element addresses the protection and conservation of the natural resources in the South Hill community such as water, air, vegetation, fish, and wildlife. The residents of the South Hill community are concerned about the loss and continual degradation of natural resources that have occurred over the past couple of decades.

Of particular concern is the loss of trees. The trees and vegetation of the Pacific Northwest offer valuable habitat to wildlife while providing the human environment with visual relief, shade, noise barriers, and an opportunity for integration of the earth’s natural resources. In surveys, open houses, and public meetings, the citizens of South Hill have repeatedly expressed concern about the tendency of new development to clear all vegetation, bring in fill, grade the site, construct homes or buildings, and then decorate with small deciduous trees.

Tree retention and replacement is a key component of the South Hill Community Plan. A number of environmental strategies are identified within the element to ensure preservation of not only trees, but groundwater and air quality as well.

DESCRIPTION OF CURRENT CONDITIONS

EARTH RESOURCES

EROSION HAZARDS, SLOPES, AND TOPOGRAPHY

The plan area is located on a plateau above the Puyallup River Valley. A rolling upland area with slopes of 8 percent or less characterizes most of the community. However, there are three areas that contain slopes in excess of 30% grade. The eastern edge of South Hill is defined by a steep hillside that drops 300 feet into the Orting Valley. South of 176th Street East, there is an east-west creek that leads to the Orting Valley and also has slopes exceeding 30%. Finally, south of 144th Street East along the 78th Avenue corridor is a drainage that contains slopes in excess of 30%. Isolated pockets of moderately steep slopes exist in a few other areas of the community. In the western end of the plan area, moderately steep slopes define a north-south drainage.

Slopes of 15% or greater are considered potential landslide and erosion hazards. Development in these areas is controlled by Pierce County’s Critical Area Regulations. The regulations
generally require that these slopes remain in an undisturbed condition and that development is set back a certain distance from the slopes.

**Seismic Hazard Areas**

Seismic hazard areas are subject to severe risk of damage as a result of earthquake induced ground shaking, slope failure, settlement, or soil liquefaction. Seismic hazard areas are noted by the presence of alluvial surficial geology or recessional outwash geology overlain by Barneston, Everett, Neilton, Pilchuck, or Spanaway soils.

Seismic hazards within the South Hill community are located along the Orting Valley hillside. New land use activities within seismic hazard areas are subject to more stringent engineering requirements, including the submittal of geo-technical reports with recommendations for mitigation measures to be taken to reduce the risk of structural damage from a seismic event. Single-family homes less than 5,000 square feet in size and subdivision of property are exempt from the geo-technical reporting requirements.

**Volcanic Hazard Areas**

Because the South Hill community is located above the Orting and Puyallup Valleys, there are no volcanic hazard areas located within the community. In fact, the community of South Hill is widely known as a safe haven for Valley residents in a volcanic event.

The maps illustrating slopes and hazard areas are found in this document.

**Water Resources**

**Streams**

Hydrology mapping by the Washington State Department of Natural Resources indicates that there is only one stream within the community plan area, Horsehaven Creek. Horsehaven Creek is located south of 176th Street East and east of Meridian Avenue. According to the Washington Department of Fish and Wildlife (WDFW), one species of native Coho has a known presence within the creek. Horsehaven Creek drains east to the Orting Valley into the Puyallup River. There is a known presence of pink, Coho, Chinook, sockeye, steelhead, and chum salmon in the Puyallup River. WDFW classifies all of the species as having depressed status.

The headwaters of Clover Creek lie just outside the South Hill community south of 176th Street East and west of 86th Avenue. The area contains steep slopes and intermittent creeks and wetlands.

**Flood Hazard Areas**

Pierce County defines flood hazard areas as those lands "in a floodplain within Pierce County subject to a one percent or greater chance of flooding in any given year." These areas have been mapped by the Federal Emergency Management Agency (FEMA) and the National Flood Insurance Program. Flood hazard areas may be referred to as the 100-year floodplain.
The FEMA maps for Pierce County indicate there are several flood hazard areas (100-year floodplains) within the community. These flood hazard areas range in size and are typically associated with either wetlands or low areas. In addition, there are 100-year floodplains associated with Horsehaven Creek and Clover Creek.

There are a number of areas mapped by FEMA as being prone to flooding on a less frequent basis. These wetlands are also associated with other wetlands or low areas. These less frequently flood areas are referred to as 500-year floodplains. Pierce County regulates 500-year floodplains in the same manner as 100-year floodplains.

**Wetlands**

Wetlands are areas that are inundated or saturated by surface water or groundwater at a frequency and duration sufficient to support vegetation adapted to life in saturated soil conditions. Examples of wetlands include swamps, marshes, bogs, and potholes. Wetlands are of significant biological and physical value and are protected under federal, state, and local laws.

Pierce County uses the National Wetlands Inventory (NWI), Pierce County Wetlands Inventory (CWI), and site specific investigations to determine the presence of wetlands. The CWI indicates that there are numerous wetlands of various sizes found throughout the plan area. The wetlands are concentrated in several areas: between 78th Avenue and Meridian Avenue, along 122nd Avenue, and south of 176th Street/east of Thun Field. There are small wetland areas throughout the County which have not been mapped. Accordingly, there may be small wetland areas within the community not found in the County database.

Wetlands in Pierce County are classified and protected according to category. Category I wetlands are the most valuable wetland systems and are typically large, diverse wetlands which provide habitat for threatened or endangered species. Category I wetlands are protected with a 150-foot buffer. Category II wetlands are typically large, diverse systems that provide significant habitat; 100-foot buffers protect these wetlands. Category IV wetlands are the least valuable, and are hydrologically isolated, less than one acre in size, and have only one dominant plant species. A 25-foot buffer protects these wetlands. Category III wetlands are wetlands that do not meet the criteria of Category I, II, or IV and are protected with a 50-foot buffer. Most wetlands in Pierce County fall into either Category II or III.

**Groundwater**

The South Hill plan area is located partially in the regional recharge area for the Clover/Chambers Creek aquifer system. Depth to groundwater is 30 or more feet. The geology of most of the plan area is such that infiltration is rapid. This high degree of permeability makes the groundwater in the area very susceptible and vulnerable to contamination. The Clover/Chamber Creek aquifer encompasses the southern and southwestern portions of the community. Pierce County designates the recharge area for the Clover/Chambers Creek aquifer system as an Aquifer Recharge Area. Pierce County has established regulations to prevent or minimize potential impacts to groundwater resulting from land use activities.
In addition to the Clover/Chambers Creek aquifer, a significant portion of the community is within aquifer recharge areas associated with wells of individual water companies.

**FISH AND WILDLIFE HABITAT**

**OPEN SPACE CORRIDORS**

The Pierce County Comprehensive Plan identifies the largest open space corridor coinciding with the Orting Valley/Puyallup River corridor. The Orting Valley hillside is part of this open space system, as is the Horsehaven Creek drainage, the Puyallup River, and the southeastern portion of the community, i.e., Sunrise. Open space corridors are chosen in part due to their relatively undisturbed natural characteristics that foster wildlife habitat and movement. Open space corridors are identified through known wildlife species and vegetative cover or forest canopy.

Open space corridors in South Hill frequently contain notable wetland systems. Thus neighborhoods west of Meridian Avenue between 152nd Street East and 136th Street East are identified on open space maps as well as several pockets along 122nd Avenue East.

Clover Creek, outside the plan area to the southwest, is also identified as a major open space corridor.

**PRIORITY WILDLIFE HABITATS**

Priority fish and wildlife habitat and species locations have been mapped by the Washington State Department of Fish and Wildlife (WDFW) and are identified in the Priority Habitat and Species Database. This database indicates that there are several such areas within South Hill. Habitat for bald eagles exists in the northwest part of the plan area and is associated with wetlands. Three significant areas of urban natural open space, i.e., relatively undisturbed areas of natural vegetation, are located in the Sunrise area and in the wetland concentrations located in the western end of the plan area. Isolated wetlands are also identified as having habitat importance.

Pierce County protection of these areas is limited to wetlands, streams, and those areas that provide habitat for a state or federally listed threatened or endangered species.

**AIR QUALITY**

The Washington State Department of Ecology and the Puget Sound Clean Air Agency monitor air quality in the Puget Sound Area. In Pierce County, air quality monitoring stations are located at Milton, Tacoma tide flats, in South Hill on 128th Street East, Eatonville, and Mount Rainier. These stations track numerous air pollutants including particulate matter, carbon monoxide, ozone, nitrogen dioxide, sulfur dioxide, and lead. The sources of these pollutants include motor vehicles, industrial emissions, residential woodstoves and fireplaces, outdoor burning, and other sources. Of these sources, motor vehicles are the largest source of pollutants, generating an estimated 57% of all airborne pollutants in Washington State.
The Environmental Protection Agency (EPA) and Washington State establish air quality standards. Failure to meet the established standards results in an area being designated as a non-attainment area by the EPA. When an area is designated as non-attainment, a plan is required to be developed to bring the area back into compliance with the established standards. The most recently published annual air quality report for the Puget Sound Region is for the year 1998 and was released by the Department of Ecology in April 1999. This report indicates that the air quality of Puget Sound region, including Pierce County, is in compliance with established standards. The trend in air quality over the past ten years in the Puget Sound region has been one of continued improvement.

**DESCRIPTION OF DESIRED CONDITIONS**

The South Hill Community Plan strives to blend the built or human environment with the natural environment. In the past 30 years, South Hill has transformed from a rural community to a burgeoning suburban community. Significant changes to the natural environment or landscape occur with the growth in population. Residents and business owners recognize that South Hill is within the designated urban growth area and that the population will continue to grow. However, growth is not to occur at the expense of the natural resources. Preservation or restoration of resources lends to maintaining a rural atmosphere and a quality community with a sense of pride.

South Hill residents recognize and want to emphasize the importance of integrating the built environment with the natural environment. Preserving native vegetation and trees is a top priority. It is recognized that trees and vegetative cover not only provide habitat for wildlife, but also alleviate the impacts of high density or intensive developments. Trees can act as buffers from noise, light, and glare while providing shade and areas for children to play. Harmonizing new growth with the natural environment is a high priority in the South Hill Community Plan.

Map J-11: Natural Environment Element was utilized during the visioning process. It represents many elements of the natural environment that are preserved through plan goals and regulations.

**EARTH RESOURCES**

**EROSION HAZARDS AND TOPOGRAPHY**

While the South Hill community does not contain a large amount of landslide and erosion hazards, it is important to ensure slopes are protected. Of particular concern are slopes above
the Puyallup River and those leading to wetlands or streams. The community plan strives to protect vegetation within hazard areas and ensure homes are set back from the top of slopes.

**Vegetation**

Citizens of South Hill place a high value on remaining forests and areas of significant vegetation. New development will not occur without retaining the trees on the property or, at a minimum, replacing them with like kind. To demonstrate the high priority placed on tree and vegetation retention, the community plan contains a number of policies on the subject and regulations are included with the plan implementation package. Tree retention is addressed in Site Design Standards and in the Landscape Standards.

**Water Resources**

Because South Hill does not contain many streams, concerns about water resources relate to wetlands, flood hazard areas, and groundwater protection. Past experiences with flooding have made it among top priorities. Recent capital projects, largely funded through Pierce County Public Works Water Programs Division, have alleviated some flooding incidents and concerns. The community plan sets forth goals and objectives to ensure flooding is minimized. One of the strategies for minimizing flooding is to recognize environmental limitations of properties. This is accomplished through zoning and revising submittal requirements for development applications. These measures also serve to protect wetlands.

A map of South Hill environmental constraints illustrates that many wetlands and flood hazard sites overlap. The community plan sets forth policy and regulatory direction to ensure development is minimized within these areas. Currently, low densities and large lot sizes are found where many wetlands and flood hazards exist. This is in part due to the environmental limitations resulting in development difficulties. The community plan recognizes this trend and recognizes these constraints through new zone classifications that will limit the density or intensity of development to coincide with the carrying capacity or capability of the land.

Design standards, introduced through plan implementation, require each development to demonstrate how it is working within the natural constraints of the land. The new standards will limit grading, filling, and design of stormwater facilities can allow wildlife movement and habitat while enhancing the visual appearance.
vegetation removal. Development projects will demonstrate how the built environment is integrated with the existing resources of the site.

**FISH AND WILDLIFE**

An important step toward integrating the built and natural environments is recognizing the role of open space corridors. The open space corridors in South Hill coincide with wetlands, flood hazards, slopes, and streams. The community plan strives to preserve these resources through policies, regulations, and long-term educational outreach. Open space corridors in South Hill are also inclusive of Priority Habitat and Species as listed on Washington Department of Fish and Wildlife maps. The preservation of open space corridors is accomplished through the same zoning actions described in the above section. South Hill is fortunate that so many resources can be conserved by properly zoning a few concentrated areas. Difficulties arise in communities where environmental constraints are distributed evenly across the landscape thus making preservation of all resource more difficult.

The community plan prioritizes the acquisition of open space in environmentally constrained areas. The County’s Conservation Future Program is recognized as a tool to help preserve these areas into perpetuity. Stewardship and management plans that address long-term protection and maintenance should also be developed. In addition to public acquisition efforts, a variety of other open space acquisition and conservation strategies are suggested to ensure long term preservation.

**AIR RESOURCES**

The greatest concern for air resources within the South Hill community lies along Meridian Avenue where discharge of carbon monoxide from automobiles can be problematic. The community plan strives to recognize air as a resource and implement measures to decrease the problem along Meridian Avenue.

The community plan recognizes the significance of long-term educational outreach to maintain quality air resources. The plan also implements several land use strategies to help improve air quality along Meridian Avenue. Land use strategies include concentrating commercial uses within centers and constructing pedestrian access to cultivate on-foot patronage. Centers are to be connected to surrounding neighborhoods and other commercial uses through sidewalks, bike paths, and marked pedestrian pathways through parking lots. Secondly, concentrating uses within defined centers allows customers to accomplish several tasks through one car trip rather than constantly having to drive to the next stop along the commercial corridor. Third, the community plan recognizes two Urban Villages that will be a strong mix of commercial and residential, thus ensuring that a certain portion of the population will not rely as much on the automobile. Finally, the plan strives to increase the number of trees along Meridian Avenue to assist with cleansing of air resources.
ENVIRONMENT POLICIES

GOALS

We envision a community where development portrays the high value citizens place on the functions and aesthetics of the natural environment; a place where neighborhoods are designed in consideration of the unique opportunities and challenges the natural environment presents; and where the ecological functions are preserved and incorporated into development sites as amenities.

WATER RESOURCES

SURFACE WATER

GOAL SH ENV-1 Maintain the predevelopment natural hydrologic conditions and functions of a site to the greatest extent possible.

SH ENV-1.1 New developments or grading and filling activities should not increase the volume of surface water exiting the site.

SH ENV-1.2 Provisions shall be made to allow for low impact development techniques.

WATER QUALITY AND WATER SUPPLY

GOAL SH ENV-2 Protect the groundwater quality and aquifer system underlying the South Hill community.

SH ENV-2.1 Prohibit activities that store, generate, or utilize hazardous materials at levels that could potentially contaminate the groundwater within all wellhead protection areas and the areas greater than 180 in the DRASTIC ratings.

SH ENV-2.2 Limit impervious surfaces and provide bioretention to recharge aquifers.

GOAL SH ENV-3 Promote and ensure water conservation through a variety of measures.

SH ENV-3.1 Require native and drought-tolerant landscaping to reduce watering needs.

WETLANDS

GOAL SH ENV-4 Preserve and protect the functions of existing wetland systems including water storage, flood control, cleansing and filtering, habitat for wildlife, and green space for visual relief.

SH ENV-4.1 Pierce County should establish a program that facilitates community involvement in the identification of possible wetland violations.

SH ENV-4.2 Develop and promote acquisition of wetlands and incentive programs for property owners whose parcels contain wetlands.
Explore the options for acquiring the following properties with significant wetland systems: 144th and 86th Avenue East (adjacent to the park); 86th Avenue East and 152nd Street East; 144th Street East and 119th/120th Avenue East; 122nd Avenue East and 136th Street East; 142nd Street East and 86th Avenue East; and west of Firgrove Elementary School and Ballou Junior High School.

**Fish and Wildlife Resources**

**GOAL SH ENV-5** Preserve and create viable wildlife habitats by connecting open space corridors and ensuring that developments provide for wildlife habitat where possible.

**SH ENV-5.1** Interconnect existing open space corridors where priority habitat species exist.

**SH ENV-5.2** Analyze sites adjacent to open space corridors for viable habitat that may include wetlands, forests, or wooded lots, and amend the open space map to include these sites.

**SH ENV-5.3** Identify sites adjacent to the open space corridors that could potentially be restored for wildlife movement. Restoration efforts should focus on working with the property owners and homeowners’ associations to remove fences or other impediments to migration, to plant trees and other vegetation, and to landscape or redesign stormwater ponds.

**SH ENV-5.4** Explore the feasibility of retrofitting existing publicly-owned stormwater facilities to encourage wildlife movement and habitat.

**Noise**

**GOAL SH ENV-6** Address local noise issues by reducing or mitigating noise-generating activities particularly associated with Thun Field, Meridian Avenue, and major arterials.

**SH ENV-6.1** Ensure aircraft noise associated with Thun Field does not significantly impact neighboring businesses or residential areas.

**SH ENV-6.1.1** Address aircraft noise associated with Thun Field through recommendations by the Pierce County Airport Advisory Committee.

**SH ENV-6.2** Ensure automobiles along Meridian Avenue and major arterials do not generate noise levels that significantly impact neighboring businesses and residential areas.

**SH ENV-6.2.1** Ensure appropriate setbacks and buffering between arterials and residential developments.
AIR RESOURCES

GOAL SH ENV-7 Improve air quality along major arterials by reducing carbon monoxide emissions caused by motor vehicles through efficient transportation planning and traffic control measures.

SH ENV-7.1 Require developments to provide pedestrian connections to schools, adjacent neighborhoods, or shopping districts.

SH ENV-7.2 Trees should be placed along major arterials to assist in air quality along the street.

IMPLEMENTING ACTIONS

The following is a list of actions that need to be completed in order to implement the policies contained within this plan. They are arranged according to the timeframe within which each should be completed: short, medium, or long term. Short-term actions should occur within one year of plan adoption. Mid-term actions should be completed within 2-5 years. Long-term actions should be completed within 5-10 years of plan adoption. The parties responsible for leading the effort to complete the action item are listed in parenthesis following the action. Actions are assigned to the South Hill Advisory Commission (SHAC), Pierce County Planning and Land Services (PALS), Pierce County Economic Development (EC), Pierce County Parks and Recreations (Parks), Pierce County Public Works (PW), Airport Advisory Committee (AAC), and Tacoma-Pierce County Health Department (TPCHD).

SHORT TERM ACTIONS

1. Improve wetland conservation measures and alleviate flooding by:
   • pursuing grants to conduct a detailed, updated wetland inventory;
   • developing an acquisition / incentive program;
   • establishing a program that involves citizen participation in wetland violations;
   • establishing a public outreach program that increases understanding regulations, penalties, and open space taxation possibilities. (PALS, SHAC)

2. Prohibit activities that store, generate, or utilize hazardous materials at levels that could potentially contaminate the groundwater within all Wellhead Protection Areas and the areas greater than 180 in the DRASTIC ratings. (TPCHD, PALS)

3. Develop and adopt regulations to ensure sidewalks are constructed on all developments within walking distance of schools. (SHAC, PALS, PW, school districts)

4. Develop and adopt low impact development standards as an option for developments to control stormwater, provide aquifer recharge, and limit impervious surfaces. Provide incentives for developments to use low impact development standards. (PALS)

MID-TERM ACTIONS

1. Establish an education outreach program with WSU Extension and homeowner associations regarding the importance of vegetation retention. (SHAC, PALS)
2. Update the South Hill Community Plan with recommendations from the Basin Plans. (PALS, PW, SHAC, AAC)
3. Work with local water purveyors to increase public awareness of water quality and quantity issues. Develop strategies, brochures, or other forms of public outreach to improve water quality and maintain quantity. (SHAC, TPCHD, PALS)
4. Inventory and analyze sites adjacent to open space corridors for habitat viability and amend open space map where revisions should be completed. (PALS, SHAC)
5. Investigate the possibility of retrofitting existing publicly owned stormwater facilities to encourage wildlife movement and habitat. (PALS, PW, SHAC)

**LONG TERM ACTIONS**

1. Obtain funding to acquire the following identified wetlands:
   - 144th Street East and 86th Avenue (adjacent to park);
   - 86th Avenue East and 152nd Street East;
   - 144th Avenue East and 119/120th Avenue East;
   - 122nd Avenue East and 136th Street East;
   - 142nd Street East and 86th Avenue East;
   - West of Firgrove Elementary School and Ballou Junior High School. (PALS, SHAC)
2. Improve air quality along Meridian Avenue by amending Title 18J to require developments along Meridian Avenue to place trees along the arterial to assist in air quality along the street. (PW, PALS, SHAC)
3. Coordinate a public education outreach program for South Hill with the Puget Sound Clean Air Agency. (SHAC, PALS, TPCHD, AAC)
Map J-13: Landslide and Erosion Hazard Areas

Landslide and Erosion Hazard Areas
- 15% to 30% Slope
- 30% to 45% Slope
- Greater than 45%

Adopted 12/30/97 - Ord. #97-84, Effective 2/2/98

Pierce County Code Title 18E regulates activities within Landslide & Erosion Hazard Areas

The boundaries of landslide & erosion hazard areas are approximate and are intended only to provide an indication of the presence of said areas. Additional hazard areas that have not been mapped may be present.

South Hill Community Plan Boundary

Pierce County, Washington
Department of Planning and Land Services
Plan Date: October 02, 2002
South Hill Community Plan
Chapter 5: Economic Element

Introduction

The Economic Element of the South Hill Community Plan builds upon the current economic strength of the community. The economic strength of South Hill is in its ability to provide commercial services not only to local residents, but also to those who reside in the rural communities located to the south and east of the Hill. Many citizens who live in Graham, Eatonville, Nisqually, and Orting purchase goods from commercial businesses located along Meridian Avenue. The regional services provided along Meridian Avenue encompass not only commercial uses, but health and civic services as well. The community plan continues to strengthen the role of South Hill as a provider of regional commercial, health, and civic services.

The community plan emphasizes quality of commercial uses over quantity. Design standards emphasize landscaping, marked pedestrian pathways to and from businesses as well as through parking lots, building variation, sign design, and lighting. Improving the appearance of the buildings which provide the pedestrian the ability to safely move about within the center will change and strengthen Meridian Avenue over time.

Description of Current Conditions

Many residents of South Hill commute out of the immediate community for employment. Thus, South Hill is largely known as a bedroom community, i.e., a community where many people live but not necessarily work. While this situation is one of the contributing factors to traffic problems, it is very difficult to change. The Community Planning Board recognized the difficulty in trying to shift the local economy to one of manufacturing particularly when situated next to Frederickson and the locational amenities that area offers to traditional industry. The Board also discussed the possibility of focusing investments and energy toward high-tech industries. However, attracting high-tech industries is a very competitive market. The plan allows for high-tech industries and employment but does not rely on them.

Industry and Employment

Reflective of a bedroom community, employment located in the South Hill area is heavily concentrated in the retail trade and services sectors, with nearly 78% of all employment in those two sectors. Using location quotients, which compare an area’s concentration of a given factor to that of a larger area (such as the nation, a state, or a region), Table J-5 shows employment concentrations in South Hill in comparison to Washington State and Pierce County. A location quotient greater than 1 indicates a high-concentration sector, a location...
quotient less than 1 indicates low concentration. Put another way, areas with a high location quotient in a sector may have a locational advantage for that sector. Relative to the State, South Hill has a higher concentration of employment in the construction, finance, insurance and real estate (FIRE), and retail sectors. Relative to Pierce County, South Hill has higher concentrations of employment in construction, FIRE and retail trade. The area has substantially lower concentrations than the State and Pierce County in agriculture, forestry and fishing, manufacturing and wholesale trade.

In terms of numbers of firms, retail trade, the sector with the highest employment, is fairly diversified with eating places and grocery and food stores representing 28% of all firms in the sector. Table J-6 shows the rank by number of firms for the top ten retail trade clusters.

Work force participation and employment in the South Hill area is similar to the rest of Pierce County; however, there is a smaller proportion of persons in the armed forces, and a larger proportion of people overall in the work force.

The South Hill work force has a moderately higher level of educational attainment than the Pierce County workforce as a whole. As shown in Table J-8, the area has similar concentrations of people with high school education through bachelor’s degree, but smaller proportions of people with less than a high school diploma and those with graduate degrees.

Firms

The number of businesses reporting tax information from the South Hill area increased steadily through the 90’s. While the number of businesses increased, there was some lag time before gross business income showed a corresponding increase. Average gross income per firm declined somewhat in the period from 1990-1995, then showed strong growth from 1995 through 1999, but has begun to level off at the higher rate (Figure J-1).

The size of firm data shows that 43% of firms in the South Hill area have 1-4 employees, and another 19% report no employees (Table J-10). Those 62% of firms represent approximately 10% of the area’s employment and provide about 8% of the area’s wages. Two firms employ 250 people or more and account for 18% of the employment and 23% of the wages paid in the area. Firms that employ between 5 and 249 people make up 38% of all firms and provide 72% of the area’s employment and 69% of the wages.

**Description of Desired Conditions**

For the most part, the local residents are satisfied with the current South Hill economy. However, there are some changes they would like to see occur, particularly along Meridian Avenue. Map J-22: Economic Element was developed during the visioning process.

Over time, the citizens would like to see Meridian Avenue restructured into distinct, identifiable centers. Each center is intended to serve a particular market and follow design standards that support the uses within that center. The community plan recognizes a need for four types of centers: regional, community, neighborhood, and central place. Regional centers are intended to serve communities surrounding South Hill and are designed for auto-oriented uses such as very large grocery stores, carpet sales, or building materials and garden supplies. Regional centers within the community plan are designated Mixed Use Districts (MUD). Community centers are intended to serve the citizens of the South Hill community for goods and services that are typically sought on less than a daily or perhaps weekly basis. Clothing stores, mid-size groceries, and restaurants are found in the designated Community Centers. These centers are designed for both pedestrian and auto uses by ensuring sidewalks are constructed from surrounding neighborhoods to the buildings, marked pedestrian pathways are provided through parking lots, and sufficient landscaping is provided to allow pedestrians a greater comfort level.
Neighborhood centers are a new concept to South Hill, but are intended to allow for very small-scale commercial businesses to meet daily needs. Neighborhood centers are located in residential neighborhoods and allow uses such as espresso businesses, dry cleaning, accounting, or tax offices. Because of the location within residential neighborhoods, these centers have restricted hours of operation and strict prohibitions on the sales of tobacco, alcohol, and gasoline. Finally, the community identified a need for a central place, a place that provides a center of the community and is alive with activity. These areas are designated Community Center, but are zoned Urban Village. Uses within this area are intended to be pedestrian dependent and designed with plazas, artwork, and pathways.

Are the goals and objectives of the community plan realistic for Meridian? The commercial real estate market changes as the population increases in the community. This change brings commercial real estate investors speculating on future needs. The scarcity of vacant commercial properties entices investment in older commercial buildings with low improvement values. When the local economy warrants, it is feasible for investors to demolish existing building and construct more profitable commercial complexes. This redevelopment offers an opportunity to the community to influence a change in the commercial landscape. Economic development is more likely to occur when a specific area or areas are targeted for financing, capital improvements, civic projects, or redevelopment. These districts (along Meridian) are expected to form the basis for moving South Hill from a suburban community without a sense of place to a community with a sense of place. The community, business owners, and County should recognize that transformation of the areas will take time and commitment.

The policies guide the type and location for new commercial establishments. Strong emphasis is placed on the survival of small independent businesses. The past growth of South Hill has brought with it large-scale retail businesses that are considered as one-stop shopping. These types of businesses draw their customer base from smaller-scale independent stores. The result is financially struggling businesses. Businesses can overcome these struggles through providing a shopping experience not available at typical larger-scale establishments. The shopping experience encompasses customer service, product selection, and ambiance. Smaller businesses may need assistance through this transformation that is necessary for survival. And it is important for these businesses to survive – through time they have become part of the community’s identity.
The community plan is a documentation of community goals and desires. With the business community working closely with citizens and interest groups to implement the community plan, improvements can be identified and implemented.

**Economic Development Policies**

**Goals**

We envision a variety of retail, commercial, professional services, and organizations established to meet the needs of both the residents of South Hill and the surrounding region. Meridian Avenue will be restructured to concentrate commercial, office, and high density residential uses within designated districts. Thun Field will be an employment area providing a variety of employment and training opportunities related to aviation and light manufacturing. We foresee that adequate infrastructure, training opportunities, and coordinated marketing strategies will support this economic development.

**General**

**GOAL SH EC-1** Identify factors that cultivate South Hill as a community reliant upon a vibrant commercial base and attractive residential areas.

**SH EC-1.1** Build upon the strengths of South Hill.

**SH EC-1.2** Recognize the strength of the South Hill economy lies in providing commercial services for South Hill citizens and residents of rural Pierce County.

**SH EC-1.3** Support and strengthen this economy by improving the function and look of existing commercial areas through design standards.

**SH EC-1.4** Maintain South Hill as a quality residential community by improving livability factors of connections, amenities, and aesthetics.

**Business and Employment Growth**

**GOAL SH EC-2** Strengthen the businesses and relationships between businesses in South Hill to create small commercial opportunities for residential neighborhoods and to ensure more unity between businesses and the South Hill community.

**SH EC-2.1** Encourage strong, cohesive business leadership that is an integral and stabilizing part of the community and is committed to improving the economic viability and aesthetic quality of commercial areas in South Hill.

**SH EC-2.2** Facilitate the formation of a local South Hill business group to focus efforts on strengthening and improving business development.

**SH EC-2.3** Inform business owners of the goals of the community plan and how local businesses may benefit from enacting the goals.
Organize a business forum to discuss the formation of a single business improvement district for South Hill or several business improvement districts for each distinct business district as identified in the Land Use Element.

Develop marketing strategies that can increase patronage of South Hill businesses.

Assist businesses in marketing by:

- Organizing a business fair to spotlight the unique goods and services available on South Hill;
- Developing/maintaining a business website that profiles South Hill businesses;
- Coordinating business workshops;
- Publishing a South Hill business directory;
- Creating a referral network among businesses in South Hill;
- Working with the local media to highlight small, unique businesses in the South Hill community; and
- Facilitating common promotion campaigns.

Coordinate efforts with the Pierce County Economic Development Board and various business organizations, including the East Pierce County Chamber of Commerce, to actively recruit professional and technical businesses to locate within the community plan area.

Establish a relationship with local community and technical colleges that can assist with specialized training needs and workforce recruitment. These relationships provide future opportunities for the placement of graduates in the job market in the community.

Explore alternatives for local businesses to fund physical improvements and marketing strategies.

Develop an informative outreach program to work with businesses to integrate design standards into business sites. Such improvements may include landscaping, signage, awnings, facade restoration, building painting, and other items as found in the design standards.

Work with the County to obtain grant funding for physical improvements to each business district such as lighting, landscaping, signage, awnings, facade restoration, building painting, and other items as found in the design standards.

Pierce County shall facilitate renovation projects that are brought into conformance with the design standards by developing a fast-track permit and review process.

Explore public/private partnerships in the redevelopment and restructuring of Meridian Avenue.
GOAL SH EC-4  Work in partnership with Pierce County, developers, existing businesses, and citizens to induce overall improvements to Meridian Avenue.

SH EC-4.1  Ensure Meridian Avenue continues to serve the needs of the community while creating a consumer-friendly atmosphere and protecting the natural environment.

SH EC-4.2  Recognize that a more natural visual streetscape, resulting from the application of low intensity uses to areas along Meridian Avenue containing numerous environmental constraints, can provide an economic benefit to the community.

SH EC-4.3  In districts defined in the Land Use Element, transition commercial strip malls to pedestrian friendly commercial nodes that meet design standards.

EMPLOYMENT OPPORTUNITIES

GOAL SH EC-5  Provide strategies that ensure that entry level and advanced employment opportunities are available within the community. Most residents drive outside of the community for higher paying employment opportunities. As the daily commute time increases, many residents desire an opportunity to work closer to home, spend less time on the road, and enjoy more time with their families.

SH EC-5.1  Create well-balanced and varied economic development that provides for entry level and advanced employment opportunities.

SH EC-5.2  Encourage growth in professional and technical employment opportunities within the South Hill community.

SH EC-5.3  Promote the location of technology-oriented businesses and organizations within the Urban Village and, where feasible, in the Employment Center.

SH EC-5.4  Actively seek professional office businesses and high tech offices for location in the Urban Village.

SH EC-5.5  Support opportunities for development, expansion, or extension of higher education facilities in the community.

SH EC-5.6  Provide opportunities to locate federal, state, or local government offices in the Urban Village.

SH EC-5.7  Encourage growth in light manufacturing within Employment Centers in South Hill and neighboring communities.

SH EC-5.8  Focus marketing efforts for the Employment Center to small-scale aviation industries, light manufacturing, and related businesses.

GOAL SH EC-6  Support transportation improvements needed to support manufacturing to the South Hill community.

SH EC-6.1  Promote improvements to 176th Street and construction of the Cross Base corridor to successfully attract light manufacturing industries to the Employment Center.
SH EC-6.2  Encourage the development of a regional transportation network to serve light industrial facilities while allowing customers greater ease in reaching all commercial venues.

SH EC-6.3  Promote improvements on Meridian Avenue that preserve regional transportation linkages while balancing community and County demands on the facility.

IMPLEMENTING ACTIONS

The following is a list of actions that need to be completed in order to implement the policies contained within this plan. They are arranged according to the timeframe within which each should be completed: short, medium, or long term. Short-term actions should occur within one year of plan adoption. Mid-term actions should be completed within 2-5 years. Long-term actions should be completed within 5-10 years of plan adoption. The parties responsible for leading the effort to complete the action item are listed in parenthesis following the action. Actions are assigned to the South Hill Advisory Commission (SHAC), Pierce County Planning and Land Services (PALS), Pierce County Economic Development (EC), Pierce County Parks and Recreations (Parks), Pierce County Public Works (PW), Airport Advisory Committee (AAC), and Tacoma-Pierce County Health Department (TPCHD).

SHORT TERM ACTIONS

1. Develop an informative outreach program to work with businesses to integrate design standards into business sites.  (SHAC, PALS)
2. Develop a process to facilitate renovation projects that are brought into greater conformance with the design standards by developing a fast-track permit process strictly for non-structural renovations that do not impact the natural environment.  (PALS)

MID-TERM ACTIONS

1. Work with the Pierce County Economic Development Board, Eastern Pierce County Chamber of Commerce, and local businesses to facilitate the formation of a local South Hill business group in order to strengthen and improve business development.  (ED, PALS, AAC)
2. Organize a business forum to discuss the formation of a Business Improvement District(s) for the Urban Village and Community Center zones.  (PALS, ED)
3. Investigate and pursue grant funding for physical improvements within the Urban Village and Community Center zones for projects such as lighting, landscaping, signage, awnings, façade restoration, building painting, and other items as found in the design standards.  (SHAC, PALS, ED)
4. Actively pursue opportunities for high-tech businesses and professional office space within the Urban Village.  (ED)
LONG TERM ACTIONS

1. Assist businesses in marketing by:
   • Organizing a “business” fair to spotlight the unique goods and services available on South Hill.
   • Developing/maintaining a business web site that profiles South Hill businesses,
   • Coordinating “business” workshops,
   • Creating a referral network among businesses in South Hill,
   • Working with the local media to highlight small, unique businesses in the South Hill community,
   • Facilitating common promotion campaigns. (SHAC, ED)

2. Assist with marketing efforts for the Employment Center for small-scale aviation industries, light manufacturing, and related businesses. (ED, PW, AAC)

3. Encourage and endorse transportation projects that contribute to the economy of South Hill such as:
   • improvements to 176th Street East and construction of the Cross-Base Corridor to successfully attract light manufacturing and aviation industries to Thun Field
   • development of a regional transportation network to serve light industrial facilities while allowing customers greater ease in reaching all commercial venues. (SHAC)
INTRODUCTION

Prior to the substantial growth experienced in the late 80's and throughout the 90's the low-density residential land use pattern sustained an acceptable quality of life with limited government facilities and services. The two-lane road networks facilitated traffic without congestion, schools provided necessary recreation areas, and the natural environment accommodated stormwater runoff.

The residential growth experienced in the past 20 years has transformed the community into an urban residential community for the Tacoma and Seattle metropolitan area. While this growth has been accompanied by additional facilities and services, such as a sheriff substation, a library, schools, road improvements, and sewer and stormwater utilities, deficiencies still continue for some types of facilities.

The Facilities and Services Element articulates future policy guidance to decisions makers for the adoption of regulations, financial investments and coordination associated with parks and trails, stormwater utilities, sewer utilities, potable water systems, public schools, Pierce County Airport (Thun Field), County satellite offices, and transportation.

DESCRIPTION OF CURRENT CONDITIONS

PUBLIC PARKS

The South Hill community currently does not have any developed Pierce County parks. The only public recreation facilities are associated with the ten public schools. The County has begun to develop one of its two undeveloped sites, the South Hill Regional Park. In addition, the County has entered into a partnership with the Puyallup School District to develop a regulation designed sports complex, the South Hill Community Athletic Complex. Pierce County recently received funding to complete preliminary planning for a trail to link the two facilities called the Chapman Trail.

South Hill Regional Park, located at the corner of 144th Street East and 86th Avenue East, is the result of a grassroots community effort. The forty-acre site is being developed with two full size
soccer fields and a paved parking lot. The fields will also be able to accommodate youth baseball and softball. The scheduled completion date is fall 2003. This land is owned by Washington State Parks Commission, which gave Pierce County a license to build a park facility on the site.

The South Hill Community Athletic Complex, located between Rogers High School and Zeiger Elementary School on 128th Street East, is a joint partnership between the Puyallup School District and Pierce County Department of Parks and Recreation. Construction on the approximately 40-acre site will begin in 2003 and be completed by the end of 2004. The facility will include five softball/baseball fields, four soccer fields, and related amenities such as parking and restrooms.

The remaining three-acre, undeveloped County park property, Half Dollar Park, is located at 120th Street East and 94th Avenue East. There are not any current plans for its development.

TRANSPORTATION

The existing roadway network within the South Hill Community Plan area contains approximately 145 miles of County roads. Not included within this figure are approximately 3.5 miles of state jurisdictional highway (Meridian Avenue E).

Pierce County employs a roadway functional classification system that assigns the County roads to various categories. The functional classification system represents a hierarchy of roadways ranging from those serving trips between and within the larger activity and population centers (Major Arterials) to those providing circulation and access to the residential neighborhoods (Local Roads). This classification system plays a number of important roles. The County’s roadway design guidelines uses the functional classification system to specify design features. Of the 145 miles of County roadway in South Hill, there are approximately 7 miles of major arterials, 18 miles of secondary arterials, 39 miles of collector arterials, and 81 miles of local roadways.

The County’s major arterials within the South Hill area are 112th St E, 160th St E, and 176th St E/Sunrise Blvd. All of these are east-west roads. The secondary arterials are 128th St E, 122nd St E, Military Rd E, 122nd Av E, Shaw Rd, 94th Ave E, and Gem Heights Drive. Of the secondary arterials, only the 122nd Ave E/Military Rd E/Shaw Rd E form an arguably “continuous” north-south roadway within the South Hill area.

MERIDIAN AVENUE E

Meridian Avenue E is the most heavily traveled roadway in the South Hill area. This four/five lane arterial now carries more than 42,000 vehicles per day (vpd) north of 128th St E. The Washington State Department of Transportation indicates that from 1995 to 2000 that traffic volumes on Meridian Ave E from 176th St E to 128th St E increased at an average rate of 2.84% per year. WSDOT has projected that based on this growth rate, that traffic on Meridian Ave E in 2020 could be as high as 61,000 vpd. Based on either the state or the Pierce County method for determining roadway level of service or roadway deficiencies, Meridian Avenue E in the more
northern section has exceeded its capacity or may be classified as having exceeded its deficiency threshold.

In January 1997 WSDOT released the findings and recommendations of the Route Development Plan, State Route 161-234 Street East to King County Line. This project, which analyzed Meridian Avenue E conditions and operations, addressed a wide range of roadway circulation issues.

The Route Development Plan did not recommend additional through lanes between 176th Street E and 128th St E. While recognizing the need for additional carrying capacity in this area, the study cited that widening the roadway would necessitate high right-of-way acquisition costs and business displacement. The study also noted that widening the roadway in this section could conceivably increase congestion north of 128th Street. While widening the mainline of Meridian was not proposed, other measures to increase mobility and move traffic were proposed as part of this study. The study’s fundamental recommendations included:

- Additional lanes on SR 161 from 234th St E to 176th St E
- Provide access controls from 176th St E to 128th St E
- Consolidate driveway approaches
- Replace two-way left-turn lanes with raised medians
- Encourage alternative trans modes
- Frontage or back road access to parcels along SR 161
- Support increase capacity of road net adjacent to SR 161
- Coordinate and optimize signals
- Increase transit services
- Construct Park and Ride lots

PROGRAMMED IMPROVEMENTS ON MERIDIAN AVENUE E

WSDOT has a number of projects programmed for implementation on Meridian Ave E. Among the more notable are described below:

176TH ST E TO 128TH ST E

A $9.2 million dollar project would provide sidewalks, street illumination, improved/interconnected traffic signals, additional turn lanes at intersections, and street trees. Engineering work for this project is funded; however, right-of-way funds have been deferred.

204TH ST E TO 176TH ST E

This project would widen Meridian Ave E within these limits to five lanes. The total project cost for this project is $13.3 million.

234TH ST E TO 204TH ST E

This project would also widen Meridian Ave E within these limits to five lanes. Engineering and right-of-way work has been completed.
**COUNTY ROADWAY DEFICIENCIES**

The description and analysis of the County’s roadway functional classification system strongly suggests a need for additional roadway connections. The absence of higher functionally classified roadways to move traffic north/south combined has contributed to congestion not only in the state roadway, but also has delayed operations on County roads. In applying a methodology now being developed as part of the County’s traffic impact fee system, only one roadway within the community plan area, 94th Avenue E, is currently listed as being deficient in its ability to carry traffic. If no improvements were made to the current roadway network by 2025, a number of roadways would be deficient within the South Hill area, inclusive of:

- 94th Ave East, from 144th St E to 116th St E,
- 160th St E – various sections between Canyon Road E to Meridian Ave E,
- 176th Street East - throughout the South Hill area, 122nd Ave E/Military Rd E/ Shaw Rd E, and
- Old Military Road

The “deficiency” method cited here may be perceived by many as a conservative measure for determining the adequacy of roadways. For example, this method may not identify those traffic issues associated with intersections.

**PUBLIC TRANSIT**

Pierce Transit provides transit service in the study area. Route 402 provides daily service between South Hill and Graham via SR 161 (Meridian Ave). Routes 400, 410, and 413 also serve the South Hill Mall Transit Center, providing service between South Hill and Puyallup, Midland, and downtown Tacoma on SR 161.

**PUBLIC SCHOOLS**

The Puyallup School District encompasses the majority of the South Hill Community Plan area with two small exceptions. The Franklin Pierce School District serves a small subdivision, approximately 25 homes, in the southwestern portion of the plan area, and the Orting School District entails approximately 675 vacant acres in the southeast portion. All ten schools located within the plan area are the Puyallup District's facilities.

The Puyallup School District's schools are comprised of six elementary schools (Brouillet, Firgrove, Hunt, Pope, Ridgecrest, and Zeiger), 2 middle schools/junior high schools (Ballou and Stahl), and 2 senior high schools (Rogers and Emerald Ridge) within the plan area. The recent enrollment for some of the schools has been greater than forecasted. This reflects the district's overall capacity of 17,688 students and actual 2002 enrollment of 19,355. If the capacity remains stagnant, the deficiency will escalate with the 2008 student forecast of 21,742 students. The result of this deficiency is the placement of portable units, larger class sizes, the use of non-classroom space and students being bussed bused to schools outside their neighborhoods.
The Puyallup School District has the responsibility to alleviate the capacity deficiencies. The district utilizes various funding sources for the construction of needed facilities. Although minimal to the overall costs of new construction, the district started to collect impact fees associated with new residential building in 1996. The current fee is $1,475 for single-family units and $750 for multifamily units. Although this fee amount represents approximately 1/4 of the district’s costs to accommodate new growth, it is the proportionate amount deemed appropriate by Pierce County.

SANITARY SEWER

Prior to 1985, the South Hill Sewer District provided sanitary sewer service to the neighborhoods in and around Sunrise Terrace in the northeastern portion of South Hill. A small number of community septic systems were serviced by Pierce County Public Works at that time. Since then, flows from existing and developing subdivisions have been redirected to Pierce County’s Chambers Creek Regional Wastewater Treatment Plant.

The South Hill community is serviced by approximately 48 miles of interceptor and collection lines. The majority of these lines (87.5%) are gravity with the remainder being force mains. The sewer infrastructure is comprised of approximately 27 miles of collection lines and 22 miles of interceptor lines.

Pierce County Sanitary Sewer Administrative Code and Tacoma-Pierce County Board of Health Regulations for On-Site Sewer Systems require properties within 300 feet of an existing public sewer line to connect to the sewer system when proposed for development.

Current regulations require vacant properties within 300 feet of an existing sewer main to connect to the sewer system when proposed for development. Existing developed property within 300 feet does not have to connect unless there is a proposal to change the use, a septic failure, or an addition to a structure that would substantiate additional bathrooms.

In the late 1990’s Pierce County adopted regulations that require new subdivisions which do not connect to the sewer system to construct dry-line sewer infrastructure in addition to an interim septic system. The premise of this regulation is that when sewer lines are extended past the project in the future, the interim septic systems will be disconnected and the dry-line infrastructure will be connected to the sewer system. The costs of constructing an interim septic system and dry-line infrastructure, maintenance, and the engineering challenges have encouraged developers to connect projects to the sewer system, with limited exceptions. Please see Map J-24: Sewer Infrastructure.

STORMWATER MANAGEMENT

As natural vegetative cover is replaced with homes, businesses, parking lots, and roads, surface water runoff (stormwater) tends to increase both in volume of runoff and rate at which the water drains off the land. Stormwater that has not been properly addressed can result in flooding, water quality and habitat degradation, and erosion.
The drainage system within South Hill is comprised of stormwater pipes, man-made channels, stormwater ponds, and infiltration facilities. This system has not been adequate for all areas within the plan area. In the recent past local home and business owners have experienced stormwater problems as a result of poor soil characteristics, lack of maintenance to facilities, and inadequate engineering specifications.

Portions of the South Hill community are within a closed depression drainage basin where stormwater flows to a series of potholes. No natural surface water outlet is present in these potholes and the only means of exit is evaporation and infiltration. Because this type of topography lends itself to frequent flooding, regulatory modifications and infrastructure investments had been prioritized since the mid-90’s to address these situations. Developments within the closed-depression areas are now required to retain all of their stormwater flows and volume on-site to prevent further build up of stormwater within the pothole. Pierce County has also obtained property and constructed regional stormwater ponds to alleviate stormwater-related problems in existing developed pothole areas. Developers may inquire with Pierce County Public Works and Utilities about connecting into the regional stormwater ponds. The regional ponds identified below are in addition to the approximately 55 publicly owned retention/detention ponds associated with individual substations.

### Table J-11: Regional Stormwater Facilities

### Basin Planning

To assist in future decision making associated with stormwater issues, a series of basin plans are being prepared by Pierce County to address all aspects of surface water management. Three such plans are being written that include portions of the South Hill Community Plan area - Clover Creek, Mid-Puyallup River, and the majority within Clear/Clarks Creek. Implementation
of the plans’ recommendations will help ensure that actions taken to improve stormwater drainage in the County are in compliance with federal and state laws and regulations, particularly the federal Clean Water Act and Endangered Species Act.

**Potable Water Supply**

South Hill residents receive their potable water (or drinking water) from one of several types of public water systems operating under different ownership arrangements (i.e., a municipal system, a mutual or an investor-owned system). The majority of residents receive their drinking water from a Group A water system, or a system serving more than 15 connections, operating under different ownership arrangements. Few South Hill residents receive water service from a Group B system, or a water system with between 2 and 15 connections. Finally, a portion of South Hill residents obtains their water from an individual well. Of the eight Group A water systems operating in the South Hill community, the majority of residents receive service from one of four systems: Fruitland Mutual Water, Southwood Water, Tacoma Water, or Firgrove Mutual Water.

The Washington State Department of Health (DOH) has regulatory responsibility over Group A water systems while the Tacoma-Pierce County Health Department (TPCHD) has primary regulatory responsibility over Group B systems, in conjunction with DOH. TPCHD is responsible for permitting individual wells. Water systems meeting certain conditions (i.e., size) are required by DOH to prepare water system plans. Such plans are required to be consistent with growth and zoning conditions contained in the relevant jurisdiction's comprehensive plan.

The Central Puget Sound area faces significant challenges in meeting the water needs for people and fish habitat with available resources. At current levels of water use, additional water supplies will be needed to meet both near-term (through 2020) and long-term (through 2050 and beyond) water demand in the region. While many of these systems would prefer the ability to drill for new sources of groundwater within their service areas, the likelihood of doing so is questionable. Instead, water systems are beginning to recognize the need to seek a regional water source to supplement existing sources of supply, which is reflected in several new regional planning efforts, such as the Central Puget Sound Water Initiative and ESHB 2514 planning processes.

At the local level, several Pierce County water purveyors operating within the urban growth boundary are in need of new sources of supply to serve anticipated new growth. Currently, both Fruitland Mutual Water and the Southwood Water, each serving a portion of the South Hill community, are reaching capacity in terms of their water rights. Both systems have recognized the need for a new water source in their current individual water system plans and each is actively pursuing alternatives for additional sources. For example, Southwood Water is currently acquiring additional water rights through the purchase of existing wells with water rights and transferring the rights into the system capacity and has formalized a request to the City of Tacoma to enter a wholesale water contract. The majority of the Southwood Water system service area in the South Hill community is within the Silvercreek development.

According to the Southwood/Sound Water System Plan, August 29, 2001, service to the
development has already been committed. Fruitland Mutual Water is currently analyzing an intertie with the Lakewood Water District. See Map J-25: Water Systems.

**Pierce County Airport (Thun Field)**

The Pierce County Airport is a publicly-owned facility operated by Pierce County. Airport and aircraft provisions located on the 150-acre site include support services for activities associated with accommodating small piston and turbine-engine aircraft, airport patron, tenants, and the general public. These support services include a single non-precision instrument lighted runway and a full-length taxiway, with exit and crossover taxiways to the terminal area facilities. The terminal area building and facilities are used and occupied under lease by aircraft operators and private and commercial enterprises. Airport hangars are owned and operated by a mix of county and private entities and provide for various uses, including individual aircraft storage, transient storage, commercial maintenance/repair, leased business and office areas. Hangar storage currently totals 138 units, with an on-demand hangar waiting list of over 35 planes. In 2001, Pierce County adopted an updated master plan that details future improvements to the airport.

The Pierce County Airport was developed in 1944 by a group of local businessmen. Initially, low-density residential sites and agricultural operations surrounded the facility. As time proceeded, the airport ownership transferred to various private individuals/partnerships. Airport improvements attracted more civilian-based aircraft and an increase in aircraft operations, growing from approximately 25,000 annual operations in the 50’s to roughly 49,000 annual operations in 1980. The residential community surrounding the airport began to grow also, but not to the extent as in the 80’s and 90’s.

In the late 70’s, the FAA encouraged a local government to sponsor the facility to assure continued aircraft recreation activity. Pierce County acquired Thun Field in 1980 with participation from the FAA and Washington State DOT, Aeronautics Division. The manager of the County Park, Recreation, and Community Services Department assumed the initial administrative sponsorship of the facility. In 1994, the airport's management was transferred to the County Department of Public Works and Utilities.

Residential construction skyrocketed around the airport in the late 80’s and throughout the 90’s. By 2002, it is forecasted that there will be a total of 170,000 operations. With the combination of residential and aircraft operation growth, various neighborhoods have an increased sensitivity towards safety and noise issues.

**Description of Desired Conditions**

Community residents emphasize that their quality of life is dependent on the level of service for certain facilities and infrastructure. Increased access to public services and additional oversight of the Pierce County Airport are also desired. Agency coordination, regulatory modifications, and public investment highlight strategies to successfully accomplish the community's goals. Map J-23: Capital Facilities Element was developed during the visioning process. The map identifies numerous facilities and services desired by the citizens.
Public Parks

The objectives, policies, and standards focus on the acquisition and development of property for public parks and a community trail system. Strategies identify possible funding mechanisms and public agency partnerships. Additional policies address park and trail design to ensure associated amenities provide visitors various opportunities for enjoyment.

Existing utility corridors are identified as potential community trail segments. Pierce County is directed to enter into discussions with the Bonneville Power Administration, Tacoma Water, and Williams Natural Gas to negotiate conditions associated with the development of a trail system. The trail system would fulfill a dual role, providing pedestrian connections between residential neighborhoods and the Meridian commercial districts, and providing passive recreation opportunities.

Five new sites are identified as possible parks. The vast majority of these sites are existing publicly owned properties or dedicated undeveloped tracts within established neighborhoods. Policy also directs the County to explore the acquisition of the property located southwest of the intersection of 144th and Meridian for a public commons area if it becomes available on the real estate market. Although a site has not been specified, the need for a multi-purpose community center has also been identified. Possible uses for this type of facility may include community holiday functions, senior activities, service organizations, etc.

Identified Public Park Sites

- Horse Haven Creek Park and Trail
- Hopp Farm/Hemlock Pond Park and Trail
- Ates Pond Park and Trail
- Reservoir Park and Trail
- Half Dollar Park (94th Avenue and 124th)

Stormwater Management

The objectives, policies, and standards strive to manage stormwater to ensure existing neighborhoods are not flooded by runoff from new development and to more effectively integrate stormwater facilities into the natural landscape. General strategies are recommended to address the contributing factors of flooding episodes: Purchasing properties that have experienced repeated flooding episodes; discouraging development in areas that are susceptible to flooding; and properly maintaining public and private stormwater facilities. The community plan should be updated with more specific recommendations once local basin planning is completed.

Sanitary Sewer

Limited policy direction is provided to Pierce County to consider revising sewer regulations to increase the required hook-up distance for formal plats beyond 300' of a main to decrease the
development of new septic systems. The desire to fully sewer the entire community should be balanced with the need to recharge the aquifer.

**Potable Water**

Acknowledging the finite resource that it is, the policy focus for potable water is placed on aquifer recharge, resource protection, and conservation. These efforts require cooperation between public agencies, water purveyors, and community groups. Due to the limited available information about the aquifers, the planning and monitoring efforts for the Chamber-Clover Creek water resource area and other regional water resource management efforts should also be supported.

**Public Schools**

Most children and young adults spend six hours a day, nine months a year in a public school. In addition to providing core education, school programs provide students with social interactions, exposure to the arts, and sports opportunities. Although the Puyallup School District has a high reputation for providing a quality education experience, the recent residential growth is straining the district's ability to provide the desired school space for students in the South Hill community.

It is recognized that the Puyallup School District is the responsible entity to address the core issues. Policies strive for increased coordination between the County and the district to develop strategies to address student capacity deficiencies. Specifically, the district is encouraged to actively pursue an increase in impact fees that are collected through the County’s building permit process. Additional coordination is also needed between the two entities to ensure students have safe walking routes from their residential neighborhoods to schools.

**Pierce County Airport (Thun Field)**

Heated debated occurs when pilots and residents living around the Pierce County Airport are convened in the same forum. Residents complain of the noise generated and acrobatic maneuvers performed by individual aircraft. Pilots respond with reference to FAA regulations, but concede that some individuals have not always complied with them. Through the planning process, both sides of the issue have recognized that a lack of productive dialogue has escalated the tension.

The primary emphasis of the policies is on the establishment of an airport advisory committee. Committee membership would represent both residential and aviation interests. In addition to updates to the master plan, the committee would explore good neighbor practices to implement at the airport. As a means to recognize the airport as a community facility, the airport master plan would be incorporated as a component of the South Hill Community Plan. This reference would require additional community review for future revisions to the master plan.
Additional policies encourage Pierce County to develop a marketing plan for available airport properties.

**PIERCE COUNTY OFFICES**

Residents and business owners are currently required to travel to the City of Tacoma to receive certain County services. The population in the community warrants some level of local access. Policies encourage the County to survey community residents and business owners to determine the appropriate services to be located in a potential Pierce County satellite service center. The County should identify existing public or private facilities in South Hill that could serve as a potential Pierce County satellite service center.

**TRANSPORTATION**

Improvements to the transportation system need to efficiently facilitate the existing and projected automobile traffic.

The policies strive to safely connect roadways, bike lanes, and trails to residential neighborhoods, schools, parks, community services and commercial areas. The community plan development is accompanied by appropriate infrastructure such as sidewalks, roads, and bicycle paths. A top priority is connections within neighborhoods, between neighborhoods, and throughout the community. Plan policies and action steps prioritize:

- sidewalk connections from schools to surrounding neighborhoods;
- sidewalk connections extending from one subdivision to another in a continuous fashion;
- sidewalk and bicycle connections from residential areas to commercial areas; and,
- pedestrian and bicycle facilities within commercial centers so the auto is not the only mode of travel.

**CAPITAL FACILITIES POLICIES**

**GOALS**

We envision a community with roadways, bike lanes, and trails that safely connect our homes with our schools, parks, community services, and commercial areas. Services such as police, fire, and County offices will be adequately staffed and easily accessible. South Hill will be an area where infrastructure such as sanitary sewers, effective surface water management...
facilities, and transportation improvements are available as developments are approved. Such facilities will allow safe, efficient access to goods and services at all hours of the day.

**GENERAL**

**GOAL SH CF-1**  The South Hill community has experienced tremendous residential and commercial growth in the past 10 years. As the community has become urban, the need for public facilities and services has increased to maintain a desirable quality of life. The policy statements in this element identify public facilities and service investments necessary to achieve the community’s vision.

**SH CF-1.1**  Explore opportunities for funding that may include special taxing districts, grant funding, and community fundraisers.

**SH CF-1.2**  Control impacts to traffic and transportation networks during construction projects.

**SH CF-1.2.1**  Utility providers shall be required to notify Central Pierce Fire and Rescue, school districts, and other utility providers regarding construction activities, schedules, and locations.

**SH CF-1.2.2**  Pierce County shall inform residents of road projects that may disrupt traffic in the South Hill area. Various communication methods should be employed to disseminate the information as quickly as possible.

**PUBLIC SCHOOLS**

**GOAL SH CF-2**  To communities such as South Hill, local schools provide the spirit of the community. Through its educational curriculum and facilities, the Puyallup School District has a high quality reputation. The residential growth in recent years has challenged the district in maintaining its quality educational environment. Elementary schools have reached their capacity even with the placement of module units. As a result, students are bused to schools outside their neighborhoods. Students that do attend local schools are either bussed or driven to schools because of the lack of safe walking routes. Acknowledging that Pierce County has a limited ability to address these issues, the intent of the school policies is to provide coordination with the Puyallup and Orting school districts.

**SH CF-2.1**  The location of schools should be considered in the planning and construction of future sidewalks and pedestrian paths.

**SH CF-2.2**  Coordinate with the Puyallup School District to identify and prioritize designated school walking routes in need of safety improvements.
THUN FIELD

GOAL SH CF-3 As a community airport, the Pierce County Airport (Thun Field) provides economic opportunities and facilitates aircraft-related training to various segments of Pierce County residents. South Hill residents recognize these positive contributions of Thun Field; however, an airport can also impede the quality of living of adjacent residential neighborhoods if appropriate mitigation measures are not put in place. The intent of the following policies is to foster communication between the aviation community, facility operators, and residents to pursue good neighbor practices.

SH CF-3.1 Improvements should be made to keep Thun Field operating safely and efficiently. Noise mitigation should proceed in conjunction with operational changes.

AIRPORT MANAGEMENT

GOAL SH CF-4 Ensure a responsive and qualified airport management team.

SH CF-4.1 A Thun Field airport advisory committee shall be formally appointed by the County Council.

SH CF-4.1.1 The membership of the committee shall be balanced to represent various segments of the South Hill community, including representatives from aviation interests, Thun Field building tenants, the South Hill Land Use Advisory Commission, surrounding homeowner associations, and the Federal Aviation Administration.

SH CF-4.2 Incorporate the Pierce County Master Plan for Thun Field as a component of the South Hill Community Plan. The master plan is hereby incorporated by reference.

SH CF-4.3 Property owners within the Pierce County Airport area of influence should be notified of proposed amendments to the Pierce County Airport Master Plan.

SH CF-4.4 Explore the possibility of creating a new Pierce County department to manage Thun Field and its operations.

GOOD NEIGHBOR PRACTICES

GOAL SH CF-5 Minimize impacts to surrounding residential neighborhoods by pursuing good neighbor practices such as:

SH CF-5.1 Occasionally scheduling airport staffing hours to extend into the evening during the summer months to monitor aircraft operations;

SH CF-5.2 Preparing and publishing a formal procedures document that outlines the steps airport officials will follow when responding to complaints;

SH CF-5.3 Establishing a formal complaint log documenting complaints associated with aircraft operations around the Pierce County Airport or management of facilities; and
SH CF-5.4 Posting airport regulations and contact information for officials serving on the advisory committee and airport staff at different facilities at the Pierce County Airport.

GOAL SH CF-6 Require Thun Field to include an architectural design plan within the master plan.

REVENUE SOURCES

GOAL SH CF-7 Thun Field shall strive to be a financially self-sufficient facility.

SH CF-7.1 Pierce County should develop a plan in consultation with the Pierce County Community Services Department - Economic Development Section and the airport advisory committee to market available commercial sites on the Thun Field property.

Pierce County Offices

GOAL SH CF-8 Residents of South Hill have various needs to access Pierce County offices ranging from applying for a building permit to attending a public hearing for a proposed subdivision. As the population of the community grows, the need for this access increases. Currently, South Hill residents have to travel between 30 and 60 minutes to a County office in the City of Tacoma. Policy direction encourages Pierce County to make the County's services more accessible.

SH CF-8.1 Access to Pierce County government services within the South Hill community.

SH CF-8.2 Encourage Pierce County to locate offices in South Hill to enable residents and business owners to attend County-related appointments and obtain permits without traveling to the City of Tacoma.

SH CF-8.2.1 Identify existing public or private facilities in South Hill that could serve as a potential Pierce County satellite service center.

SH CF-8.2.2 Survey various segments of the South Hill community to identify which services are desired in the community.

Parks and Recreation Policies

GOAL SH PR-1 Provide and maintain park lands and recreational facilities and services within the community that are accessible to adults and children and meet the recreational needs of an urban population.

SH PR-1.1 Develop recreational facilities identified and desired by the South Hill community.

SH PR-1.2 Actively pursue opportunities to acquire land for the following types of park and recreational facilities:

SH PR-1.2.1 Community multi-use trail system;

SH PR-1.2.2 Athletic fields;
SH PR-1.2.3 Picnic areas;
SH PR-1.2.4 A park that includes a community center for seniors equipped with kitchens and potentially gym facilities;
SH PR-1.2.5 Tennis courts; and
SH PR-1.2.6 Covered outdoor basketball courts.

SH PR-1.3 Support the development of an aquatic center in the Emerald Ridge High School neighborhood.

SH PR-1.4 Initiate discussions to revise the distribution of County monies that are raised through activities at other parks.

**TRAIL SYSTEM**

GOAL SH PR-2 Adopt a trail corridor map that identifies desired segments for a South Hill community trail system.

SH PR-2.1 Multi-use trails should incorporate existing utility corridors including gas, power, rail, and road rights-of-way.

SH PR-2.2 Design the community-wide trail system to connect residential areas located within one mile of schools.

SH PR-2.3 Explore strategies to remove various types of natural and built barriers to allow connections between existing subdivisions and commercial districts to a community-wide trail system.

SH PR-2.4 Promote development of the South Hill Heritage Corridor and its linkage to Naches Trail.

SH PR-2.5 Promote development of a trail link between the Rogers/Zeiger Athletic Complex and the 9th Street Pit/Half Dollar Park along 90th Avenue East.

SH PR-2.6 Promote development of a trail link between the South Hill Community Park, the property located southwest of the intersection of 144th and Meridian, Hemlock Pond/Hopp Farm, and the Tacoma Public Utilities Reservoir site along 144th Street East.

SH PR-2.7 To increase state and federal funding opportunities, the trail system should connect commercial/retail centers with residential areas and activity centers.

SH PR-2.8 Identify segments of the trail where a par course for exercise and recreation is warranted and feasible. Distance markers should be placed along the trail for walkers and runners.

GOAL SH PR-3 Actively pursue opportunities to develop a community-wide trail system.

SH PR-3.1 Pierce County should enter into discussions with the Bonneville Power Administration, Tacoma Water, and Williams Natural Gas to negotiate conditions associated with the development of the trail.
Developing a trail network should be pursued in the listed order of priority:

- Tacoma Water pipeline right-of-way;
- Bonneville Power Administration right-of-way; and
- Williams Natural Gas right-of-way.

Trail segments that connect residential areas and schools should have a higher priority for local funding.

Pierce County should initiate discussions with area school districts to develop linkages between residential areas and schools.

Provide incentives for development projects that incorporate connections to the trail identified in the adopted South Hill trail plan.

Amend the Pierce County Park, Recreation, & Open Space Plan to analyze feasibility and pursue active and passive park/recreational uses in the following priority:

- Horse Haven Creek Park and Trail;
- Hopp Farm/Hemlock Pond Park and Trail;
- Ates Pond Park and Trail;
- Reservoir Park and Trail; and
- Half Dollar Park (94th Avenue East and 124th Street East).

If the property located southwest of the intersection of 144th Street East and Meridian Avenue becomes available for sale, Pierce County should explore acquisition for a park and recreation site with community facilities, such as a senior center.

Park design should incorporate amenities that provide visitors various opportunities for enjoyment.

Incorporate a multi-purpose community center with indoor kitchen and gymnasium facilities into an identified park site. The facilities should be designed to accommodate activities for all segments of the community.

Recognize the need for both passive and active recreation in parks in the South Hill community.

Incorporate amenities into passive parks that provide added enjoyment for visitors, such as interpretive signage, trails, and picnic tables.
SH PR-4.4.3 Explore the development of an off-leash dog park.

SH PR-4.5 Incorporate regulation standard athletic fields in the design of the Rogers/Zeiger Sports Complex.

SH PR-4.5.1 Athletic fields should be designed to meet baseball, softball, football, and/or soccer regulation specifications for area and materials, including those items reasonably necessary for play during daytime and evening hours for all ages.

TRANSPORTATION POLICIES

TRANSIT FACILITIES AND SERVICES

GOAL SH T-1 Develop public transportation as a viable alternative to the automobile to reduce roadway congestion, maintain air quality, conserve energy resources, and support the economic vitality of the community.

SH T-1.1 Provide fixed route and/or demand responsive transit services between the centers of the South Hill area and regional major destinations. These services should be coordinated between Pierce Transit and Sound Transit fixed bus route and commuter rail services.

SH T-1.2 Transit services should serve a number of areas and roadways including:

SH T-1.2.1 70th Avenue /Woodland Avenue East;
SH T-1.2.2 86th Avenue East;
SH T-1.2.3 94th Avenue East;
SH T-1.2.4 Meridian Avenue East;
SH T-1.2.5 122nd Avenue/Military Road East/Shaw Road East;
SH T-1.2.6 112th Street East;
SH T-1.2.7 122nd Street East;
SH T-1.2.8 128th Street East;
SH T-1.2.9 136th Street East;
SH T-1.2.10 144th Street East;
SH T-1.2.11 152nd Street;
SH T-1.2.12 160th Street East;
SH T-1.2.13 176th Street East; and
SH T-1.2.14 Sunrise Parkway East/Sunrise Boulevard East.

SH T-1.3 The State should investigate the possibility of high capacity transit and preference for high occupancy vehicles along the Meridian Avenue corridor.
SH T-1.4 The State should pursue the potential of adding additional through lanes on Meridian Avenue East from 176th Street East to 112 Street East.

SH T-1.5 Work with homeowners' associations, colleges, businesses, and other community groups to encourage participation in vanpool programs.

SH T-1.6 The State, Pierce Transit, and Pierce County should coordinate the selection of park-and-ride sites.

SH T-1.6.1 A site should be considered for the southern boundary of the community plan area at 176th Street East and Meridian Avenue.

ROADS

GOAL SH T-2 Develop a roadway network that balances the regional mobility needs with the local access needs of the community.

SH T-2.1 The highest priority roadway capacity projects should address the north/south corridors, while the next highest capacity projects should reflect those projects that provide access to the east/west corridors.

GOAL SH T-3 Develop and implement plans and regulations that will create additional connectivity between neighborhoods.

SH T-3.1 Develop regulations that require new subdivisions to be designed in a manner that maximizes opportunities for connectivity.

SH T-3.2 Review the roadway and nonmotorized facilities connectivity needs created by new development and require the construction of the facilities that meet these needs.

GOAL SH T-4 Geographically distribute roadway capacity improvements through the larger Pierce County neighborhood.

SH T-4.1 The highest priority corridor improvement projects should circulate traffic around rather than through the South Hill area.

SH T-4.1.1 Support specific projects that would help to achieve this such as the implementation of the Canyon Road East corridor improvements (inclusive of the north and south extension), Meridian Avenue East Improvements, the widening of 176th Street E., development of the Shaw Road Avenue E./Military Road E./122nd Avenue E. corridor, and the development of the Cross Base Highway.

SH T-4.2 Orient new residential areas away from proposed and existing new major and secondary arterial roadways.

GOAL SH T-5 Implement planned roadway improvements that may play a role in the evacuation of the city of Orting residents in the event of a natural disaster.

SH T-5.1 Construct the planned 176th Street East extension to the city of Orting.
Nonmotorized Facilities

Goal SH T-6
Plan, program and construct nonmotorized facilities throughout the South Hill community.

SH T-6.1 Priority shall be given to providing pathways within a one-mile radius of schools.

SH T-6.2 Bike facilities, where appropriate, should be provided along roadways such as:

SH T-6.2.1 70th Avenue/Woodland Avenue East;
SH T-6.2.2 86th Avenue East;
SH T-6.2.3 94th Avenue East;
SH T-6.2.4 Meridian Avenue East;
SH T-6.2.5 122d Avenue/Military Road East/Shaw Road East;
SH T-6.2.6 112th Street East;
SH T-6.2.7 122nd Street East;
SH T-6.2.8 128th Street East;
SH T-6.2.9 136th Street East;
SH T-6.2.10 144th Street East;
SH T-6.2.11 152nd Street East;
SH T-6.2.12 160th Street East;
SH T-6.2.13 176th Street East; and
SH T-6.2.14 Sunrise Parkway East/Sunrise Boulevard East.

SH T-6.3 All new subdivisions, planned development districts, and multifamily developments along arterials shall provide pedestrian facilities within the development and along the arterial.

SH T-6.4 All new commercial developments shall provide sidewalks or pedestrian connections between businesses and a sidewalk along the frontage road.

SH T-6.5 Pedestrian facilities and bicycle facilities that are required should be built when new road corridors or road widening projects occur.

Meridian Avenue

Goal SH T-7
Complete improvements to Meridian Avenue that support the desired land use pattern and allow the corridor to be more pedestrian accessible while still conveying regional transportation.

SH T-7.1 Improve the Meridian Avenue corridor by providing nonmotorized facilities, transit services and facilities, and access management strategies.
Focus County, state, and local citizens’ efforts to improve Meridian Avenue.

Encourage the Washington State Legislature to prioritize roadway improvements to Meridian Avenue that support the community plan goals and further define centers and districts.

To prioritize improvements on Meridian Avenue East, WSDOT should:

Establish a committee of citizens, business owners, Pierce Transit, County staff, and WSDOT staff to identify needed improvements and potential funding sources;

Adopt a corridor management plan that details the planned improvements; and

Propose revisions to state transportation programs and/or budgets to ensure improvements are implemented.

WSDOT, Pierce Transit, the County, and the community shall coordinate state, regional, and local plans for Meridian Avenue East.

Connect commercial development along Meridian Avenue with the larger community around it, becoming integrated into a total destination where people can participate even when they are not shopping.

Encourage Meridian Avenue development that considers pedestrian use and the retrofitting of existing land.

Require existing strip malls and commercial development along Meridian Avenue to provide access to adjacent property when improvements are made to the existing business.

Develop model site plans that demonstrate techniques to retrofit existing commercial strip malls.

Structure zoning along Meridian Avenue to encourage denser forms of development that can be reached by multiple access modes.

Allow diverse land uses along Meridian Avenue in ways that encourage walking and discourage driving for short trips and errands.

Connect new plats, subdivisions, multifamily complexes, and manufactured home parks to schools, parks, other subdivisions, neighborhoods, and the rest of the community. Connectivity must be improved and provided throughout the community. Citizens, and children in particular, must have the ability to move from one location to another in a safe, efficient manner. Neighborhoods must be connected to schools and shopping districts.

Connections between new developments and existing neighborhoods shall be provided via sidewalks, bicycle paths, trails, or roads.
**SH T-8.2.2** The County should actively explore opportunities to connect existing subdivisions and neighborhoods with surrounding subdivisions and the larger community. Connections should be included in transportation programming where possible.

**SH T-8.2.3** New subdivisions, new multifamily complexes, and new manufactured home parks that are adjacent to a nonmotorized route within the Pierce County Transportation Element shall provide direct access to the route.

**SH T-8.2.4** Allow nonmotorized connections through wetland buffers and other sensitive areas where road connections cannot occur.

**SH T-8.2.5** Connectivity between new residential subdivisions shall be provided between abutting parcels having subdivision potential where there are no unreasonable geographic, environmental, or legal barriers.

- **SH T-8.2.5.1** Roadway connectivity should be implemented through construction of carefully planned road stub-outs that consider the level of projected traffic volumes, address possible impacts of increased traffic on subdivision residents, and review how the connection locations may affect plat design and the developable land in each affected subdivision.

- **SH T-8.2.5.2** Roadway connectivity should be accomplished through the design and connection of local road feeders or local road minors, rather than cul-de-sacs. Local road feeders are recommended for safely accommodating the projected traffic volumes while minimizing impacts of this through traffic to those residing in the subdivision prior to the connection. Local road minors may be utilized for connectivity of small subdivisions under low volume, low speed situations.

**SH T-8.2.6** New developments located adjacent to or containing a project included in the Pierce County Transportation Plan or Six-Year Transportation Improvement Program should be planned and designed to accommodate the projected improvement, such as:

- **SH T-8.2.6.1** Dedicating or setting aside right-of-way for the project;
- **SH T-8.2.6.2** Providing appropriate location and design of development access; and
- **SH T-8.2.6.3** Incorporating portions of the proposed improvement within the development when appropriate.

**SH T-8.2.7** Through-roads shall be provided when feasible to increase connectivity for the community.

**SH T-8.2.8** Cul-de-sacs or dead-end roads should be allowed when critical areas inhibit the possibility of a through-road. When a cul-de-sac or dead-end road is allowed, it should be designed as a loop or circular road design with a private open space, recreational, or artistic area in the center. There shall be provision of adequate emergency access in the cul-de-sac design.
Integrate transportation and land use along Meridian Avenue.

Pedestrian rest islands or median breaks should be provided along Meridian Avenue.

Control access through the use of medians and curbs with few breaks. Provide vehicular and pedestrian circulation between businesses within a block.

Plan for traffic volume and capacity to accommodate the needs of both through and destination traffic.

Transportation solutions must be scaled to the specific nature of Meridian Avenue, and the districts located along the avenue, and balanced to serve multiple needs and multiple markets.

Require shared parking among uses.

Street-scale lighting shall be placed in center medians while pedestrian-scale lighting shall be placed along sidewalks.

**Transportation System Management**

**GOAL SH T-9** Monitor the South Hill transportation roadway network for potential applications of transportation system management strategies (TSM).

**SH T-9.1** Monitor the need and apply where appropriate such TSM strategies as:

**SH T-9.1.1** Signal interconnect systems, signal coordination and synchronization, transit signal priority, and other signal improvements to facilitate smooth traffic flow;

**SH T-9.1.2** Turn lanes and turn pockets to allow turning vehicles to move out of through traffic lanes; and

**SH T-9.1.3** Off-street truck loading facilities, where appropriate, to separate goods loading/unloading from goods and people movement, and provide for the efficient movement of goods and traffic.

**Coordination**

**GOAL SH T-10** The County, state, Pierce Transit, and utility companies shall coordinate their respective projects on a particular roadway to minimize traffic disruption.

**SH T-10.1** When scheduling and permitting construction activities, Pierce County Public Works should minimize delays on alternate roadways that are within close proximity of one another.

**Community and Neighborhood Connectivity**

**GOAL SH T-11** Pierce County shall evaluate all publicly-owned land and rights-of-way to determine pedestrian linkage opportunities.
SH T-11.1 The County shall provide regulatory measures for new development to implement the road projects and priorities identified in the transportation portion of the Transportation Element.

SH T-11.2 The County shall investigate alternate means to prevent future development from encroaching on the potential right-of-way of future roadway projects.

SH T-11.3 Require developments generating more than 50 pm peak hour trips to have a minimum of two points accessing different public roadways. Consideration should be given in those circumstances where this standard cannot be met.

GOAL SH T-12 Ensure traffic flow is safe for pedestrians and cyclists.

SH T-12.1 The County, after designating a crosswalk location, should consider differentiating the major, secondary, and collector arterials crosswalks from the street through the use of brick pavers, stamped concrete, or other visual and physical means.

SH T-12.2 Work with the County Public Works department to allow on-street parking on its roadways.

**Utilities Policies**

**Stormwater**

GOAL SH U-1 The intent of the following policies is to reduce the effects of flooding episodes, improve the function of existing stormwater facilities, and to more effectively integrate stormwater facilities into the natural landscape.

SH U-1.1 Maintain the predeveloped hydrology of a site and reduce reliance on traditional surface water management techniques.

**Frequently Flooded Areas**

GOAL SH U-2 Reduce flooding in the South Hill community.

SH U-2.1 Properties with development limitations due to standing water and high groundwater tables should be included as *sending sites* in a Transfer of Development Rights program to provide a financial return to the property owner and preserve the natural functions of the site.

**Sewer Facilities**

GOAL SH U-3 The Planning and Land Services Department and Public Works and Utilities Department should consider revising sewer regulations to increase the required hook-up distance for formal plats beyond 300 feet of a main to decrease the development of new septic systems.
WATER SYSTEMS

GOAL SH U-4

The provision of adequate domestic water supplies is a crucial component of supporting population growth. The intent of the following policies is to ensure that adequate water supplies are available to support projected population growth and water conservation measures are enacted.

SH U-4.1 Encourage land uses and programs that promote aquifer recharge and an adequate water supply within the plan area.

SH U-4.1.1 Ensure landscape regulations promote water conservation.

SH U-4.1.2 The design of new public parks and their facilities in South Hill should allow for water re-use.

SH U-4.1.3 Encourage Pierce County, Pierce College, WSU Extension office, and community groups to develop a contest or demonstration garden to increase public awareness of water conservation issues, alternatives, and xeriscaping.

SH U-4.1.4 Solicit South Hill businesses and community groups to sponsor an annual yard maintenance workshop that teaches homeowners proper fertilizer and pesticide application methods.

SH U-4.2 Pierce County should seek to amend state laws to allow water to be transferred among pressure systems and water purveyors to accommodate growth and development.

GOAL SH U-5

Coordinate watershed planning processes for the Chambers-Clover Creek Water Resource Inventory Area (WRIA), conducted under State law Engrossed Substitute House Bill (ESHB) 2514, with other planning efforts in Pierce County.

SH U-5.1 Utilize the Chambers-Clover Creek Watershed Plan in future updates to the South Hill Community Plan.

SH U-5.2 Consider the results of the water availability analysis conducted under ESHB 2514 when making future land use decisions within the WRIA.

SH U-5.3 Support monitoring of groundwater through the ESHB 2514 Chambers-Clover Creek Watershed Plan process.

IMPLEMENTING ACTIONS

The following is a list of actions that need to be completed in order to implement the policies contained within this plan. They are arranged according to the timeframe within which each should be completed: short, medium, or long term. Short-term actions should occur within one year of plan adoption. Mid-term actions should be completed within 2-5 years. Long-term actions should be completed within 5-10 years of plan adoption. The parties responsible for leading the effort to complete the action item are listed in parenthesis following the action. Actions are assigned to the South Hill Advisory Commission (SHAC), Pierce County Planning and Land Services (PALS), Pierce County Economic Development (EC), Pierce County Parks and
Recreations (Parks), Pierce County Public Works (PW), Airport Advisory Committee (AAC), and Tacoma-Pierce County Health Department (TPCHD).

**SHORT TERM ACTIONS**

1. Appoint a Thun Field Advisory Committee to work with the County, airport managers, and users to ensure good neighbor practices. (Pierce County)

2. Develop an urban essential public facility PUD for the Pierce County Airport. (PALS, Public Works, Pierce County Airport Advisory Commission)

3. Identify existing public or private facilities that could serve as a potential Pierce County satellite service center. (SHAC)

4. Augment each school district’s effort to identify, program, and implement improved nonmotorized connections to their local schools. Review the existing and future needs for improving existing connections between the schools and neighborhoods using such information as the individual School Walk Route Plan. Develop strategies for implementing such connections. (PWU, PALS)

5. Appoint a committee to investigate and recommend solutions to the Thun Field Area of Influence and Employment Center. The committee should consider safety records, compatibility issues, the need for industrial lands, and the viability of Thun Field as an Employment Center. Members of the committee should include WSDOT Aviation Division, Pierce County Public Works and Utilities, Pierce County Economic Development, Puyallup School District, property owners within the EC zone, property owners within Zone 6, and representatives from the CPB and the SHAC.

**Parks**

6. Develop and adopt a detailed plan for the South Hill Community Trail that:
   - links to schools, parks, neighborhoods;
   - promotes or links to the Heritage Corridors where possible;
   - provides educational and fitness resources;
   - includes interpretive signs. (PALS, SHAC)

7. Pursue community trail development through discussions/negotiations with Bonneville Power Administration, Tacoma Water, and Williams Natural Gas. (PALS, SHAC)

8. Conduct a study to determine the feasibility of the acquiring and developing the parks listed in this Element with the desired amenities and water reuse systems. (Parks and Recreation, SHAC)

9. Amend the Pierce County Parks and Recreation Plan to include the active and passive park/recreational uses in accordance with plan priorities and results of the feasibility study. (Parks and Recreation)

**Transportation**

10. Amend parking requirements for parks where adjacent to school sites. (PALS)

11. Develop and implement measures for traffic calming and speed control facilities to be utilized to increase safety. Consider revising road design standards or functional classifications in order to implement traffic calming measures. (SHAC, PALS, PW)
12. Revise the transportation concurrency method to reflect the congestion on the roadway network and relate to the methodology of the traffic impact fee program. (PWU, PALS)

13. Augment each school district’s effort to identify, program, and implement improved nonmotorized connections to their local schools. Review the existing and future needs for improving existing connections between the schools and neighborhoods using such information as the individual School Walk Route Plan. Develop strategies for implementing such connections. (PWU, PALS)

14. Amend the Pierce County Transportation Plan projects and 6-year Transportation Improvement Plan to reflect the projects and priorities of the South Hill Community Plan. (PALS, PW)

15. Develop and adopt incentive-based regulations that provide for density incentives in exchange for a public benefit, such as dedication of rights-of-way, to help achieve the goals of the community plan. (PALS, PW)

**Mid-Term Actions**

1. Establish annual workshops with adjacent cities and communities to establish coordination and communication for establishing services and facilities. (Pierce County, SHAC, AAC)

2. Explore opportunities for funding for services and facilities that may include special taxing districts, grant funding, and community fundraisers. (PALS, SHAC)

3. Explore opportunities to co-locate community facilities and services. (PALS, SHAC, PW, AAC)

4. Establish a system by which utility providers are required to notify Central Pierce Fire and Rescue, Puyallup School District, and other utility providers regarding construction activities, schedules, and locations. (Public Works)

5. Identify properties that need to be acquired to preserve existing flood plains and construct CIP projects. (Public Works, SHAC)

6. Educate the public about the County's Floodplain Preservation and Property Acquisition Program. (Public Works, SHAC)

7. Formalize an educational program to communicate the tenets of sustainable development techniques to the South Hill community. (Public Works, SHAC)

8. Develop an inspection program for existing public and private stormwater ponds within subdivisions to enforce existing maintenance agreements on private stormwater facilities. Where the responsible homeowners' association is not responsive to the maintenance of the private stormwater facility and public resources are necessary to complete the maintenance, fees and liens on property should be applied. (Public Works)

9. Develop a contest or demonstration garden to promote water conservation measures. (SHAC, WSU, Water Purveyors)

10. Sponsor a yard maintenance workshop to instruct homeowners on the proper use of fertilizers and pesticides. (SHAC, Water Purveyors)

11. Pursue amendments of state law in order to allow water to be transferred among pressure systems and water purveyors. (PALS, TPCHD)
12. Review local water purveyor’s ability to serve the expected densities and 20 year growth projections. Recommend service area revisions to problem areas. (Public Works)
13. Update the South Hill Community Plan with revisions from the Basin Plan. (PALS, Public Works)
14. Coordinate with local school districts to increase impact fees. (SHAC)
15. Coordinate with local school districts to identify and prioritize designated walking routes to school. (SHAC)
16. Coordinate roadway and utility related construction activities in order to minimize the delays on alternative roadways within close proximity of one another. (PWU)

Parks
17. Conduct public forums to discuss the formation of a local park taxing district or service area to fund park/trail acquisition and maintenance. (SHAC, Parks and Recreation)

Transportation
18. Assess the demand and operational feasibility for fixed route and demand responsive transit services in the South Hill area and to the outlying areas. Services for these areas should be implemented if they are operationally viable and aid in the reduction of traffic congestion in the South Hill area. The assessment should include the following roadways: (Pierce Transit, Sound Transit)
- 70th Avenue/Woodland Avenue East
- 86th Avenue East
- 94th Avenue East
- Meridian Avenue East
- 122d Avenue/Military Road East/Shaw Road East
- 112th Street East
- 122nd Street East
- 128th Street East
- 136th Street East
- 144th Street East
- 152nd Street East
- 160th Street East
- 176th Street East
- Sunrise Parkway East/Sunrise Boulevard East

19. Assess the need, benefits, costs, and implementation strategies for providing significant capital and operational improvements on and along Meridian Avenue East inclusive of the addition of through lanes on Meridian Avenue East from 176th Street E to 112th Street E and the implementation of access management strategies. WSDOT should develop and prioritize these strategies by:
- establishing a committee of citizens, business owners, County staff and WSDOT staff to identify needed improvements and potential funding sources;
- adopting a Corridor Management Plan or EIS that details the planned improvements; and
• proposing revisions to state transportation programs and/or budgets to ensure improvements are implemented. (WSDOT, PWU)

20. Site, coordinate, and implement the selection of one or more park and ride sites that will serve the South Hill area. A site should be considered near the southern boundary of the community plan area such as 176th Street East and Meridian Avenue. (WSDOT, Pierce Transit, Pierce County)

21. Establish a system by which South Hill residents will be informed of road projects that may disrupt traffic in the area. (Public Works, SHAC, Pierce Transit)

22. Coordinate roadway and utility related construction activities in order to minimize the delays on alternative roadways within close proximity of one another. (PWU)

23. Develop a neighborhood speed control program by:
   • Approving a budget to develop and implement the program.
   • Hiring staff to produce administrative procedures to evaluate and prioritize options for interested neighborhoods.
   • Considering the use of speed control methods inclusive of bulb outs, traffic circles, and speed humps. (PWU)

24. Implement the nonmotorized plan by including priority projects in the 6-year Transportation Improvement Plan. Investigate and implement methods to fund the comprehensive system.

LONG TERM ACTIONS

1. Develop and implement a marketing plan for commercial sites at the airport. (Pierce County Economic Development, airport advisory committee)

Parks

2. Develop an internal process that facilitates private land donation opportunities. (Parks)

South Hill Community Plan
Chapter 7: Plan Monitoring

**Purpose**

The 1990 State Growth Management Act (GMA) requires jurisdictions planning under GMA to report on progress made in implementing the Act, and to subject their comprehensive plans to continuing evaluation and review. As part of the County’s Comprehensive Plan, the South Hill Community Plan is subject to this requirement. One mechanism for conducting this evaluation and review is to monitor the development standards, regulations, actions, and other programs called for in the plan for the purpose of determining their effectiveness in fulfilling the vision of each of the six elements of the plan.

This section provides a framework both for monitoring the various actions undertaken to implement the plan and for offering recommendations to make adjustments to the actions in order to achieve the vision of the plan. Actions may include the development and implementation of regulations and design standards, working with South Hill to coordinate the provision of facilities and services, developing educational programs and handouts, acquiring parks, preserving open space, and other actions. This framework for monitoring provides a means for measuring the effect of each action, identifies participants and their roles in monitoring the actions, lays out time frames for monitoring, and specifies how the monitoring program should be documented. Information obtained from the monitoring program will be used to offer recommendations to decision makers as to what changes to the community plan may be needed in order to attain specified goals and meet the visions in the plan.

**How to Measure the Effects of Standards**

The South Hill Community Plan identifies actions that need to be implemented to meet its vision, goals, objectives, principles, and standards. Monitoring evaluates the effectiveness of the actions in fulfilling the plan policies. The monitoring program outlined here includes several steps which are intended to identify actions taken, the ease with which they can be used, and whether the actions actually meet the objectives they were intended to achieve.

To do this, the monitoring program is divided into five steps: Actions, Inputs, Process, Outputs, and Outcomes. Each of the steps and the responsible participant are discussed briefly here.

**Phase 1 – Actions:**

Phase 1 monitoring would consist largely of reviewing the policies and standards stated in the plan and identifying all the actions that need to be undertaken to be consistent with the plan. The actions should be grouped according to the objectives they are intended to meet. PALS staff and the South Hill Advisory Commission (SHAC) would be the primary participants in this activity.
Phase 2 - Inputs:

Phase 2 monitoring would determine whether actions called for in the plan have actually been undertaken and completed. PALS staff would evaluate if regulations and design standards have been adopted. Review to determine if other actions have been completed and could be done by the SHAC or other County departments.

Phase 3 - Process:

Phase 3 monitoring would evaluate whether an action is straightforward, understandable, or easy to use. In the case of regulations and design standards, those persons who have submitted permit applications requiring compliance with the regulations and design standards would need to be involved in the evaluation. The Pierce County Hearing Examiner and the SHAC, which review such applications, as well as PALS staff, would need to be included in the monitoring. PALS staff would coordinate the monitoring and could conduct interviews or distribute questionnaires to persons who have submitted or reviewed permit applications subject to the regulation being monitored.

Phase 4 - Outputs:

Phase 4 monitoring would determine whether the action has been carried out as stated in the plan. For example, monitoring would determine whether a regulation or design standard has been complied with and identify reasons for any noncompliance. In regard to non-regulatory activities, monitoring would determine whether the objectives of the activity have been met. Participants would include residents, property owners, the SHAC, and PALS staff.

Phase 5 - Outcomes:

Phase 5 monitoring would evaluate the extent to which each action results in the desired effect on the community. The primary participants are the residents and property owners in the plan area. Assistance would be provided by the SHAC and PALS staff. PALS staff would assist in organizing public meetings, preparing and distributing questionnaires, and using other means to gather this information.

Timeline

It is anticipated that the South Hill Community Plan will take a substantial period of time to be implemented. There are a number of actions that can be accomplished within a short timeframe, some will take much longer, and others will involve ongoing actions with no specific completion date. It is important that monitoring be done on a continuing basis with specific actions monitored at different times.

In regard to monitoring the development and implementation of regulations and design standards, it would be appropriate for monitoring to be phased over time as the five phases...
outlined above are accomplished. Phase 1 would begin almost immediately upon the plan adoption. Phase 2 would take place within two years following the plan adoption. This would provide adequate time for the County Council to adopt implementing regulations called for in the plan. Phases 3, 4, and 5 would occur within two to three years following completion of Phase 2. This would allow time for the regulations to be applied to a number of development projects. Phase 3 analysis of how understandable the regulations are, and the ease to which they can be applied, would then be based on the application of the regulations to those projects developed within that time period. Phases 4 and 5 monitoring would be done simultaneously with Phase 3 monitoring. The total time for initial monitoring for Phases 1 through 5 would be about five years. As changes are made to regulations and design standards, the monitoring cycle would need to be repeated to address the changes.

Other actions that do not involve the implementation of regulations or design standards would be monitored on a similar timetable. Phase 1 and Phase 2 would occur within two years of adoption of the plan, while Phase 3, 4, and 5 monitoring would occur within five years of plan adoption.

As amendments are made to the plan, monitoring would need to continue to determine how effective the changes are in carrying out the goals in the plan. In addition, it would be appropriate to continue monitoring all actions in the plan every five years to evaluate whether the actions continue over time to effectively carry out those goals.

**DOCUMENTATION**

A review of baseline information is necessary to effectively monitor whether the goals of the South Hill Community Plan are being met. Information regarding community attitudes, visual characteristics of the community, community services, infrastructure, business climate, land uses, permitting activity, and other community characteristics would be evaluated.

As each phase of monitoring is completed, a report should be prepared by PALS staff which identifies the action being monitored, the specific purpose of the monitoring, methods used in monitoring, data collected, analysis of the data, and recommendations for further action. The report should be submitted to the SHAC for review and comment and to the County Council for its consideration.

**RECOMMENDATIONS FOR FURTHER ACTION**

In addition to determining the effectiveness of the plan in fulfilling the goals of the community, a key component to monitoring would be the recommendations for further action. These recommendations should clearly identify the specific goals being addressed, how the recommended action corrects a deficiency in the plan, how the recommended action will contribute to fulfilling the goal in question, and a timeline for completing the proposed action.
Appendix K: Upper Nisqually Valley Community Plan

The Upper Nisqually Valley Community Plan’s narrative text and policies are in addition to the Countywide Comprehensive Plan narrative text and policies and are only applicable within the Upper Nisqually Valley Community Plan Boundary.

- “Current” or “Existing” conditions are in reference to conditions at time of adoption (Adopted Ord. 99-66s, Effective 1/1/2000).
- “Proposed” or “Desired” conditions are those which required Council action and may have also been amended over time through a Comprehensive Plan Amendment (amendments are reflected in this document).

Chapter 1: Introduction

Overview of the Plan Area

The Upper Nisqually Valley Community Plan area is located in southeast Pierce County, Washington. The plan area is approximately 18 miles in length beginning slightly north of Alder Dam and extending eastward along the State Road 706 highway corridor through the communities of Alder, Elbe, and Ashford, terminating at the Nisqually entrance to Mt. Rainier National Park. The southern border of the plan area is the Nisqually River and Lewis County.

The northern border follows the northern boundary of the Upper Nisqually River Watershed. Major highways within the plan area are SR 7 and SR 706. The plan area consists of approximately 27,000 acres. Roughly 50 percent of this area is public lands held by the Federal, State, or local government. The majority of the public lands are designated forests which provide significant recreational opportunities and conservation of wildlife habitat. Population in the plan area is approximately between 1,100 - 1,200 persons. Population density is approximately 28.1 persons per square mile.

The Upper Nisqually

The community of Alder, at an elevation of 1,220 feet, is characterized by a series of homes, the Alder General Store, Alder Church and Alder Community Club, and a Washington State Department of Transportation maintenance facility. Alder is located on a gently sloping hillside above Alder Lake at the entrance to Alder Lake Park. The first vista of Mount Rainier from within the plan area for east-bound travelers is visible as one leaves Alder heading east. The west end of the valley consists of rolling foothills with a combination of open pasture and hardwood and coniferous forests.

The Cascade foothills occupy the northern edge of the plan area and begin just east of Alder Hill. The central valley contains large pasture areas which provide beautiful views of Mount Rainier. The highway corridor throughout the central valley is characterized by tall evergreen trees that align the roadway. The east end of the valley is a combination of forests, pastures, and commercial nodes. The entrance to Mount Rainier National Park borders the easternmost end of the plan area. The south side of the plan area is bounded by the Nisqually River which divides Pierce and Lewis Counties.
ALDER, ALDER LAKE AND LA GRANDE RESERVOIR

The west end of the plan area is dominated by two man-made bodies of water, Alder Lake and La Grande Reservoir, which were formed by the Alder and La Grande Dams, respectively. The dams were built for hydroelectric generation and include powerhouses at Alder Dam and at La Grande, downstream from La Grande Dam. The dams are owned and the reservoirs managed by Tacoma Power under license from the Federal Energy Regulatory Commission.

ELBE

The Elbe area is distinct because the Cascade foothills fall steeply to the shore of Alder Lake, allowing only enough room for SR 7. The community of Elbe, at an elevation of 1,210 feet, serves as the western terminus of the main portion of the Nisqually River Valley floor. The unincorporated community of Elbe lies between the steep hillside of the Cascade foothills to the north and east and Alder Lake and the Nisqually River to the south and west. Elbe is comprised of a platted townsite with small residential home sites along streets off SR 7 and primarily tourist-oriented commercial development along the SR 7 corridor through the community. The community is dominated by the train-oriented facilities located between SR 7 and Alder Lake.

The train facilities include lodging, a restaurant, and the terminus for an excursion train that runs approximately six miles south to Mineral in Lewis County. There is a dinner train operating from Elbe. The historic Elbe General Store and the Elbe Evangelical Lutheran Church provide two more unique sites in the community. Several other commercial businesses, a second church and a fire hall are also located in Elbe. Elbe sits at the junction of SR 7, which runs west to Tacoma and south to Morton, and SR 706 which runs east to Mount Rainier National Park. The southern highway entrance to the plan area is by way of the SR 7 bridge over the Nisqually River at Elbe.

The hills above Elbe to the north and east are part of the DNR's Elbe Hills State Forest, an area of recreational trails for hikers, horseback riders, and cross-country skiers, in addition to being an active commercial forest. The Elbe Hills State Forest contains two identified trail systems: the Sahara Creek/Nicholson Horse Trail System for horseback riders and hikers, running along lower slopes of the Elbe Hills from Elbe east approximately six miles to the Sahara Creek Campground; and the Elbe Hills Off-Road Vehicle (ORV) Trail System for jeeps, motorcycles, and mountain bikes, located higher up in the Elbe Hills.

ASHFORD AND NATIONAL

The Ashford community is located along SR 706 at an elevation of 1,769 feet. It is characterized by a mix of homes, restaurants, stores, lodging, a post office, fire hall, small to medium sized residential lots, and vacant, wooded lots. The hillside above the west end of Ashford, to the north, has a large recent clearcut. The area between the highway and the Nisqually River contains homesites with pastures and a large clearcut.
The community of National has not existed for decades but, at one time was the site of a large timber mill. The area currently consists of large, vacant tracks of land which are mostly owned by the Washington Department of Natural Resources. The water district also has some facilities in the area. The road system within National is currently comprised of dirt and gravel logging roads.

The east part of Ashford is characterized by two motels, one of which includes several cabins and a restaurant. A large subdivision composed of 305 small lots (Echo Valley) is located on the southeast side of Ashford. Over half of the lots within Echo Valley are vacant. Along Mount Tacoma Canyon Road is a moderate-size subdivision of 55 small lots (High Echo), the majority of which are vacant.

**PARK ENTRANCE**

For about one mile from Goat Creek to the entrance to Mount Rainier National Park, at an elevation of 2,000 feet, there are visitor-oriented commercial activities and small residential home sites. The commercial development is characterized by restaurants, an inn, a motel, commercial cabins, RV park and camping facilities, and a few retail businesses. Near the entrance to the Park is a large subdivision of 145 small lots (Nisqually Park), which is only about half developed. The eastern entrance to the plan area is at the gate to Mount Rainier National Park.

**MOUNT RAINIER NATIONAL PARK**

The campaign to establish a national park emerged in the 1880s when several influencing factors converged to give the park movement momentum. Among those who played important roles were the local commercial interests in Tacoma and Seattle that aggressively promoted tourism to the future park area, especially through the operations of the grand Northern Pacific Railroad hotel, *The Tacoma*, which opened its doors in 1884. No less significant were the string of small hotels and inns stretching between Tacoma and Longmire Springs, and the discovery of Paradise Valley as a popular destination point. Organized political pressure to create the national park came from various individuals and groups.

Mountaineering clubs, local newspapers, commercial clubs, and national scientific and geographic interests lent their weight. Notable individuals, particularly prominent European visitors to Mount Rainier, and John Muir who climbed the mountain in 1888, gave the park movement strong support through newspapers and other publications. With the creation of the State of Washington in 1889 and the Pacific Forest Reserve in 1893, the proposal to create the nation’s fifth national park moved a step closer to reality. Conservation was, for the first time in American history, a priority of the federal government in the 1890’s, and local congressmen joined Interior Department officials in pushing for the establishment of a park area surrounding Mount Rainier within the larger Pacific Forest Reserve. Throughout the 1890s the park proposal in Congress was introduced six different times and finally passed on March 2, 1899.
Mount Rainier National Park is predominantly a one-day visitor park, and the overwhelming majority of visitors enter at the Nisqually Entrance on the southwest corner of the park. Along the 19-mile road between the entrance and Paradise Valley there are hotels, campgrounds, overlooks, and trailheads. At Paradise, 5400 feet in elevation, is the park’s major visitor center and the 126-room historic Paradise Inn which opened in 1917. The Stevens Canyon Road, a paved highway, connects Paradise Valley with the east side at State 123. In the northeast section of the park a highway off State 410 climbs to Yakima Park, elevation 6400 feet, with limited services during summer months.

**Gifford Pinchot National Forest**

The USDA Forest Service (USFS) manages an area along the eastern edge of the plan. The National Forest lands are technically part of the Mount Baker-Snoqualmie National Forest, but are administered by the Gifford Pinchot National Forest. Congressional action would be necessary to formally transfer the lands between the two forests. The Gifford Pinchot National Forest runs from Mount Rainier south to the Columbia River Gorge and from Mount Saint Helens east to Mount Adams and the crest of the Cascade Mountains. The Gifford Pinchot National Forest is responsible for administering 1,371,720 acres, including the portion of the forest within the plan area. The forest is managed through the Forest Land and Resource Management Plan (hereafter referred to as the "forest plan") of 1990 as amended by the Northwest Forest Plan of 1994 which guides all natural resource management activities and establishes management standards for the forest. The forest plan establishes multiple use goals, management direction for future activities, the allowable sale quantity for timber, and the identity of lands suitable for timber management.

The forest plan was revised by Amendment 11 in February 1995 to institute changes resulting from the development of President Clinton's 1994 plan for managing habitat for species found in late-successional and old-growth forests in the range of the northern spotted owl.

The forest contributes to the quality of life for the people of the Upper Nisqually Valley and the greater Puget Sound region. Outdoor recreation opportunities, including backpacking, hiking, and mountain-biking, are readily available. Old-growth trees provide aesthetic and recreational value. Scenery includes snow-capped mountains, glaciers, lakes, streams, waterfalls, and rock outcrops. The forest has a diverse population of plant and wildlife species.

**Washington State Department of Natural Resources Elbe Hills State Forest**

The Washington Department of Natural Resources (DNR) manages approximately 23,000 acres of land as the Elbe Hills State Forest which is located within the plan area. Elbe Hills State Forest is part of an original 1889 land grant from the Federal government. The DNR manages the State forest for both timber production and recreational use.

In January of 1997, the Federal government signed agreements allowing for implementation of the DNR's Habitat Conservation Plan (HCP) for managing lands containing northern spotted owl
habitat. The HCP is a way for the State to obtain relief from the prohibition on removing habitat of species covered under the Endangered Species Act, including the northern spotted owl and marbled murrelet. An HCP is a plan generated by a landowner, in this case the DNR, that provides long-term conservation measures for a listed species in exchange for the right to take a portion of its habitat. The HCP offsets the harm to individually listed animals with a plan that promotes conservation of the species as a whole. The DNR's approved HCP provides mitigation for removal of habitat through timber harvest by providing habitat areas for the northern spotted owl and marbled murrelet.

The HCP manages land to minimize the harm done to the habitats of seven other listed species within the range of the spotted owl. The HCP conserves habitats for numerous unlisted species west of the crest of the Cascade Range, including western Washington runs of salmonids. In addition to the protection of northern spotted owl, marbled murrelet, and aquatic habitat, the HCP identifies and protects cliffs, caves and cave passages, oak woodlands, and talus fields that provide habitat for various other species.

**History of the Upper Nisqually Valley**

Native American groups inhabited the Upper Nisqually Valley for thousands of years. The Nisquallys were the primary group that occupied the area and had many permanent villages along the Nisqually River. Other groups, from both the west and east sides of the Cascades, used the mountain as a hunting ground and considered it sacred. After the Indian War of 1855-1856, the Nisquallys were not allowed to return to their villages.

European settlement of the Pacific Northwest did not occur until the early part the nineteenth century. The original impetus for settlement was the desire to control areas for fur trapping. The Native Americans showed the early settlers where to find and how to utilize wild plants that provided food such as potatoes, onion, carrots, water lily roots, and skunk cabbage roots.

In the latter half of the 1890's through the early 20th century, the Klondike gold rush in Alaska created a boom in the Seattle area as a center for outfitting and supplying prospectors on their way to the mines. Although gold and silver mining in the Cascades was fairly limited, coal was extracted from mines near Mount Rainier including Wilkeson, Carbonado, Mineral, and just north of Ashford. Numerous mine claims in and around Mt. Rainier were established beginning in 1898. Coal mining declined when hydropower generated electricity and oil replaced coal as energy resource in the 1920's.

Prior to the establishment of a national park in 1899, residents in the Puget Sound area traveled to Mount Rainier during the summer to recreate. Although mountain climbing expeditions were most notable, many groups also traveled to the Mountain to horseback ride, fish, and camp. The railroad companies and local residents recognized the potential for tourism and invested in various endeavors to accommodate visitors from the Puget Sound region.

German immigrants and homesteaders settled at the Elbe town site in the late 1800's. A plat for the town of Elbe was filed in 1903. In the early days, the town functioned as a market center where loggers, Native Americans, and farmers came to exchange goods and produce. The town hall, completed in the 1890's, functioned as a gathering place for the surrounding communities
and drew people from Longmire to Tanwax when there were special events such as elections, dances, or holiday celebrations.

The first logging and milling operation in Elbe started in the early 1900’s. Many mills were in operation by the time Tacoma Eastern Railroad reached Elbe in 1904. In 1936, the passenger railroad service stopped with the completion of the Mountain Highway. During the depression of the 1930's, youths came from all parts of the country to work on the construction of trails, roads, and buildings within Mount Rainier National Park. One of the compounds erected to house the workers was located near Elbe.

**The Ashford and the Hershey Family c. 1915**

Mining prospects initially attracted settlers to the Ashford area. Although some coal mining occurred, the logging and milling industry soon became the economic focus. The town became an important log-shipping center. In 1904, anticipating growth in the valley, Walter and Cora Ashford platted the townsite in their name. In the same year, the Tacoma Eastern Railroad Company extended its railroad line to Ashford. By the early 1940's, with the decline of the logging industry, the town’s economy relied on recreation and tourism.

The Pacific National Lumber Company established the town of National in 1905. This company-owned town rented housing to its employees in addition to operating a general store. The employees of the company either worked as loggers or as part of its milling operation. The company holdings were sold and eventually bought by the Weyerhaeuser Company in the 1950's. By this time the town began to decline.

Homes were bought by individuals and moved off the site. The Washington State Department of Natural Resources now owns the properties. Farm settlement began in the Alder area in the early 1890's. After the Tacoma Eastern Railway lines reached La Grande and became available to transport milling equipment and logs, a shingle and saw mill located at the north fork of Alder Creek. Shortly after railroad spurs were built to reach the new mills, a hotel and store were built by the Alder Mill Company. The Alder Dam was completed in 1940's to supply electric power to the City of Tacoma. The Alder Lake (reservoir) covered more than 200 acres of farm land and the original town of Alder.
PLANNING HISTORY

COUNTY PLANNING

1962 PIERCE COUNTY COMPREHENSIVE PLAN AND ZONING

The first Pierce County Comprehensive Land Use Plan was adopted on April 2, 1962. The Pierce County Zoning Code, which implemented the Comprehensive Plan, was adopted on October 8, 1962. The 1962 Pierce County Comprehensive Plan designated the Upper Nisqually Valley, along with the rest of southern and eastern Pierce County, as “rural residential.” The purpose of the rural residential designation was to “…identify an area which lies outside the path of immediate urban expansion, and to delineate a boundary of suburban residential development which is consistent with adequate public service being provided.” Low density residential use was recommended in rural residential areas to: “…avoid premature and uneconomic extension of public facilities and services; reserve potential residential land in sufficiently large ownership parcels to permit proper subdivision at a future date; and provide areas within reasonable commuting distance of major employment centers where rural living can be enjoyed with a minimum of use restrictions.”

From 1962 until 1990, the plan area was zoned General Use, which allowed a wide range of commercial, industrial, residential, and resource uses. In July and November of 1990, the General Use Zone was amended to require multifamily residential and most commercial and industrial uses to go through the conditional use public hearing process. Also in 1990, per Ordinance No. 90-178S, the Pierce County Council approved an area-wide rezone of forest lands of long-term significance to a Forest Land zone, which primarily allowed the growing, harvesting, and processing of forest products. With regard to the plan area, the Forest Land zone encompassed most of the foothills and mountains north and east of Elbe. In 1993, per Ordinance No. 93-8452, most of the remaining plan area was rezoned from the General Use to General Rural zone. The General Rural zone required a minimum lot size for residential subdivision of land of 10 acres, as was the minimum lot size for non-residential uses. There were three areas of the Upper Nisqually Valley which remained zoned General Use: the Elbe area; the Ashford area, west of Mount Tahoma Canyon Road; and the Park entrance area, between Kernahan Road and Mount Rainier National Park.

1994 PIERCE COUNTY COMPREHENSIVE PLAN AND DEVELOPMENT REGULATIONS-ZONING

In 1990, the Washington State Legislature passed legislation referred to as the Growth Management Act (GMA). GMA required Pierce County to develop and adopt a comprehensive plan which would control residential, commercial, and industrial growth. Thirteen goals are listed in GMA to guide policy development in nine required elements. The required elements include land use, housing, capital facilities, utilities, rural, and transportation. Pierce County also elected to include four additional elements: environment and critical areas, economic development, community plans, and essential public facilities. Each of the nine GMA required elements must conform to specific standards set in the legislation. The rural element...
requirements in the originally adopted GMA contained very general standards. It stated that “...Counties shall include a rural element including lands that are not designated for urban growth, agriculture, forest, or mineral resources. The rural element shall permit land uses that are compatible with the rural character of such lands and provide for a variety of rural densities...”

In 1997, the Growth Management Act was amended to provide more flexibility and detail in the type of development allowed in the rural areas of counties. The new provisions recognize that rural characteristics and land use patterns are different between counties across the State. Counties are now allowed to consider local circumstances in the development of policies and regulations for a designated rural area. As a consequence, limited areas of more intensive uses may be planned. The new requirements specifically addresses infill development, recreational and tourist uses, and cottage industries.

In 1994, per the requirements of the Washington State Growth Management Act, Pierce County adopted a new Comprehensive Plan. The 1994 Pierce County Comprehensive Plan replaced the 1962 Pierce County Comprehensive Plan in its entirety. The 1994 Comprehensive Plan identified the entire Upper Nisqually plan area as “rural.” The new plan contained the following land use designations for the valley: Rural 10, which encompasses the floor and western end of the Upper Nisqually Valley; Rural Neighborhood Centers, in Ashford and Elbe; Designated Forest Land, in the hills and mountains north and east of Elbe; and Rural 20, which encompasses a narrow buffer along the western edge of the Designated Forest Land—east of the Eatonville Cut-off Road.

These land use designations are further described within the Land Use element of this plan. In July 1995, per Ordinance No. 95-79S, the Pierce County Council adopted the Pierce County Development Regulations-Zoning which implemented the 1994 Pierce County Comprehensive Plan. The Development Regulations-Zoning created zoning districts which mirrored the names and locations of the Comprehensive Plan designations.

Projects received by Pierce County Planning and Land Services are vested under the rules and regulations that apply at the time the development application is submitted. There are several projects in the Upper Nisqually Valley that are presently undergoing County review that were received before the community planning process had even begun. The community plan policies and regulations do not directly apply to these projects and cannot be used to influence the types of uses allowed.

COMMUNITY PLANNING

Pierce County Comprehensive Plan policies found in the Community Plans Element address community autonomy, community character, new community plans, consistency with the Comprehensive Plan, consistency with the Development Regulations-Zoning, transition strategies, and joint planning agreements.

The Community Plans element of the 1994 Pierce County Comprehensive Plan envisions a local voice in how the Comprehensive Plan and its Development Regulations will be carried out in communities. Community plans exemplify how the objectives and policies of the
Comprehensive Plan play out when applied to detailed and specific conditions. They indicate specific land use designations, appropriate densities, and the design standards that should apply in community planning areas. Preserving and building community character while ensuring an efficient and predictable development approval process is a central theme. Community plans are a unifying force for communities. They identify local characteristics. They survey population, employment, transportation, building, and social attributes. Community plans help citizens decide what they want to nurture and what they want to change at the local level, where citizens live and interact.

Although the Growth Management Act (GMA) does not require comprehensive plans to provide for community plans, Pierce County Ordinance 90-47S directs County officials to prepare a Community Plans element of the Comprehensive Plan. The majority of unincorporated County population resides in community plan areas. The Community Plans element spells out how to coordinate consistency between community plans and the Comprehensive Plan. Community plans must be consistent with the Comprehensive Plan and the GMA. Flexibility exists only in the interpretation of how Comprehensive Plan policies apply in a given community or in areas where the Comprehensive Plan is silent on an issue or does not provide detailed guidance. Ensuring such consistency requires comparing proposed community plan policy and land use designations against each policy of the Comprehensive Plan. If a community plan policy would mean that a Comprehensive Plan policy could not be met in the community planning area, the policies would be incompatible and therefore inconsistent.

If a community plan vision or policy can be determined to have County-wide value, then the Comprehensive Plan policy may be altered. Otherwise, modifications to any inconsistent community plan policy will be necessary until it meets the consistency test. Changes to any community plan will be developed collaboratively by citizens with County staff and adjacent jurisdiction’s staff for adoption by the County Council. To avoid unnecessary and undesired inconsistencies between a community plan and the Comprehensive Plan, the unique values and community desires reflected in individual community plans should be reflected, built upon, and incorporated into the Comprehensive Plan.

**UPPER NISQUALLY VALLEY COMMUNITY PLANNING EFFORTS**

In the summer of 1996, Pierce County Planning and Land Services Department began to develop an integrated community plan and environmental analysis for the Ashford/Elbe community. This effort was the first sub-area plan to be initiated since the adoption of the County’s GMA comprehensive plan. But prior to Pierce County’s involvement, the community had already begun outlining visions for the future. These visions, articulated in the 1992 Upper Nisqually Community Report and the 1994 Upper Nisqually Community Workshop Report, became the basis for the visions and policies of the Upper Nisqually Valley Community Plan.

**1992 UPPER NISQUALLY COMMUNITY REPORT**

In the spring of 1992, students from The Evergreen State College conducted a community survey and in person interviews with the Upper Nisqually community. The students’ efforts
resulted in the Upper Nisqually Community Report, also known as the “Evergreen Study.” The students mailed approximately 1,100 surveys out to the community and received back 226 completed survey forms, a 20.08 percent return rate. In addition to the analysis of the survey results, the Community Report includes anecdotal history and opinions from valley residents. Three proposed visions for the future were identified by the students: no change, bedroom community, and tourist service community. The survey showed the community would like to see future growth directed into towns or centers.

### 1994 Upper Nisqually Community Workshop Report

In the winter and spring of 1994, the Rivers, Trails, and Conservation Assistance Program of the National Park Service, along with a non-profit facilitation organization known as the Sonoran Institute, worked with the Upper Nisqually community to develop two community visioning workshops. The workshops were held in June 1994. The residents attending the workshops identified and prioritized values the community held, visions the community had for the future, and actions to implement the top priority visions and values of the community. This effort also lead to the formation of the Upper Nisqually Community Forum. This group of community representatives was responsible for carrying out the actions identified in the visioning process. As the County’s planning efforts materialized, this group eventually disbanded.

### Scope of the Community Plan

#### Legislative Authority to Develop the Plan

In the Community Plans element of the 1994 Pierce County Comprehensive Plan, the Upper Nisqually Valley, i.e., Ashford-Elbe area, was identified as a community for which a future community plan would be developed. Pierce County Resolution R96-68S, passed June 11, 1996, directed the Pierce County Planning and Land Services Department to develop an integrated community plan and environmental analysis for the Upper Nisqually Valley, i.e. Ashford-Elbe community. The resolution establishes that the community plan should seek to: maintain the rural character and natural beauty of the area which draws both residents and visitors and to encourage appropriate tourism and provide economic opportunities for community residents.

In March 1996, Pierce County Planning and Land Services was awarded a grant which partially funded the community planning effort for the Upper Nisqually Valley area. The state legislature made the grant monies available through its Planning and Environmental Review Fund. The Washington Department of Community, Trade, and Economic Development administers the grant program. The intent of the grant funding was to assist communities that are attempting to integrate environmental analysis into growth management planning efforts. The State hoped that the communities using these grant monies would develop plans that could serve as models for other communities in Washington State.
PURPOSE AND USE OF THE COMMUNITY PLAN

The Upper Nisqually Valley Community Plan will give residents, property owners, business people, and Pierce County government a clearer, more detailed sense of how the community wants to develop in the future and what standards could be utilized to create and maintain the look and feel identified in the community plan through goals, objectives, principles, and standards.

The Upper Nisqually Valley Community Plan develops a vision for the entire Upper Nisqually Valley region of Pierce County; develops a vision unique to each community within the valley; refines the Pierce County Comprehensive Plan to more closely reflect the needs, concerns, and desires of those in the valley while making sure that what the valley community desires will still fit well with the big picture for all of Pierce County in terms of County-wide policies; and identifies actions necessary to implement the community plan, including: adopting or revising land use regulations; identifying priorities for use of public funds to develop physical improvements such as sidewalks, street landscaping, street lights, water-related improvements, and park development; social programs; and economic programs.

The community plan has been prepared with the expectation that growth can occur within the Upper Nisqually Valley and can bring vitality to Ashford and Elbe while continuing to retain rural character throughout the area. This growth may occur at the rate which is accommodated in the plan or may occur more slowly than anticipated in the plan. Growth, and the rate at which it occurs, will largely depend upon the actions of the local community such as marketing of services and coordination of activities with public land managers.

The policies contained in the plan are distinguished as goals, objectives, principles, and standards.

**Goals** are a general vision statement by the community.

**Objectives** are statements of what is desired to be achieved in the future or statements of what conditions should exist in the community.

**Principles** set a particular course of action to accomplish objectives.

**Standards**, quantitative or qualitative, are specific benchmarks or targets to be accomplished in the ongoing development of the County.

All of the policy statements were developed through citizen comment and represent the will of the people translated into decision oriented statements. When applying the policy statements, each should be afforded equal weight and consideration.

CONSISTENCY WITH THE 1994 PIERCE COUNTY COMPREHENSIVE PLAN

The goals, objectives, policies, and standards in the Upper Nisqually Valley Community Plan are consistent with the provisions in the Pierce County Comprehensive Plan. Although the community plan proposes to change land use designations within the valley, the proposed
designations are already defined and policy direction included in the County Comprehensive Plan.

The plan does propose new zoning districts to implement the existing land use designations. The regulations associated with the zoning districts conform with the general provisions of the existing land use designations.

**PUBLIC INVOLVEMENT**

**THE GATEWAY COMMUNITY ADVISORY BOARD**

The development of the Upper Nisqually Valley Community Plan could not have been accomplished without the Gateway Community Advisory Board (GCAB). The GCAB, appointed in June of 1996, consisted of a nineteen member group representing a variety of interests and geographic locations of the community. Representatives included: Tacoma Power; National Park Service; U.S. Forest Service; Department of Natural Resources; Nisqually Indian Tribe; Visitor Convention Bureau; the local service providers; environmentalists; development interests; recreationalists; business interests; forestry; and local residents from both Pierce and Lewis Counties.

The GCAB was charged with three main responsibilities: 1) serving as a sounding board for the community; 2) guiding the development of policies and map changes that address community concerns while remaining consistent with the Comprehensive Plan; and 3) identifying regulations to implement the policies of the Upper Nisqually Valley Community Plan.

The efforts of the GCAB were exemplary and cannot be understated. Members attended over 45 meetings, 2 open houses and workshops, and donated over 135 hours of their personal time to see the visions of the community brought to fruition through this document.

**VISIONING**

Visioning is the process of defining the hope and dream of what the community could be in the future. Visioning is typically completed through a series of public meetings or workshops structured to allow the community to articulate hopes for the future. Statements, thoughts, and ideas brought forth in the visioning process become the basis for the visions, goals, objectives, and principles of the community plan.

Many of the visions and policies found in the Upper Nisqually Valley Community Plan were developed in the workshops and surveys of the 1992 Upper Nisqually Community Report conducted by Evergreen State College and the 1994 Upper Nisqually Community Workshop Report conducted by the National Park Service.

To add to the information provided by Evergreen State College and the National Park Service, Pierce County Planning and Land Services and the Gateway Citizen Advisory Board sponsored a community open house and workshop in October 1996. The main purpose of the open house was to provide information to the community about the planning process and to get feedback.
from the community on the results of the 1992 Evergreen Study and 1994 Community Visioning Workshops. The public was asked to provide written comments about the planning process and their community. A week after the open house, a workshop was held to gain specific feedback from the community on certain land use issues and to survey the community’s attitude toward different types of development. At the workshop, participants discussed various issues in small groups and participated in a visual preference survey.

Throughout the first part of 1997, the Gateway Community Advisory Board (GCAB) utilized the information from the 1992, 1994, and 1996 visioning processes to formulate an overall vision statement for the community plan and five individual vision statements for each of the plan elements. These six vision statements echo the desires articulated by the community throughout the years by emphasizing the importance of: the natural environment and resources; a small, close-knit community composed of unique and creative individuals; the rich history and heritage of the valley; locally owned and operated businesses that are the strength of the economy; the value in being situated close to the National Park, National, and State forests; and the rural lifestyle that provides a valuable haven to residents and visitors.

**Open Houses and Workshops**

The National Park Service held two workshops in June of 1994 which resulted in the Upper Nisqually Community Workshop Report. One hundred one participants attended on June 5, and 82 participants attended on June 6. The workshops laid the groundwork for the visions and policies articulated in the Upper Nisqually Valley Community Plan. In October 1996, an open house and a workshop were held to inform the public about the County planning process and receive feedback on how the community envisioned the future of the valley. On March 5, 1998, over 150 people attended an open house that was held to present the GCAB’s preferred alternative to the public and receive feedback on the proposal.

**Surveys**

In addition to the visioning process, the community was asked to complete surveys on several occasions. Surveys are a useful tool for canvassing more of the community. Many people are uncomfortable with speaking publicly but if allowed to comment privately will do so. Surveys were used as part of the study completed by The Evergreen State College, the 1996 workshop, the Draft Environmental Impact Statement of the Preferred Alternative, and at the March 1998 open house. The residents of the Upper Nisqually Valley respond well to surveys and usually have a 20-30 percent return rate.

**Summary of the Upper Nisqually Valley Community Plan**

The proposed Draft Upper Nisqually Valley Community Plan contains policies and implementing regulations for five subject areas or elements: Land Use Element, Community Character and Cultural Element, Natural Environment Element, Economic Element, and the Infrastructure and Services Element.
The Land Use Element addresses what and where land uses and intensity of land uses would be allowed. It includes zoning and regulations that govern land uses. The community plan directs residential and commercial growth into three centers and maintains the rest of the community in large tracts of land that may be used for homes or natural resources activities such as farming or forestry.

The Land Use Element establishes three commercial centers and designates each of these centers as a Gateway Community. These three centers are Elbe, Ashford, and the Park Entrance.

Commercial and residential uses are allowed through the application of three new zoning classifications:

1. Village Center Zone:
   Allows a mix of activities including civic, lodging, all services, and natural resources-based light industrial manufacturing for employment in historical locations. Encourages pedestrian orientation. Residential allowed at 3 units per acre, employee housing also allowed. All of Elbe and a portion of Ashford are zoned Village Center.

2. Village Residential Zone:
   Allows residential at 1 unit per 10 acres, senior housing, and group homes. Education facilities and day-care also allowed. A portion of Ashford, including Echo Valley and High Echo subdivisions, are zoned Village Residential.

3. Tourist Commercial Zone:
   Allows restaurants, lodging, and sales of general merchandise and rental of recreational equipment up to 5,000 square feet. Residential allowed at the same density of the surrounding rural residential zone. The Park Entrance and a portion of Ashford (Hewitt Field properties) are zoned Tourist Commercial.

The majority of the plan area remains as zoned in the 1994 Comprehensive Plan which promotes a rural land character of large tracts of land containing single family homes or resource-based activities. The existing rural zones contained within the plan area are: Rural 10, Rural 20, Forest Lands, and Rural 40. The Rural 40 zone is new to the Upper Nisqually Valley plan area and allows only one unit per 40 acres with no bonus density provisions. The Rural 40 zone is located immediately adjacent to the Nisqually River and encompasses all of the Case II Volcanic Hazard Areas.

The Community Character and Cultural Element addresses community character, heritage, and social interaction. The policies contained within the Upper Nisqually Valley Community Plan promote and enhance historic preservation through education and restoration of historic properties, encourage views and viewsheds are maintained throughout the Valley, and establish design standards and guidelines for buildings, site design, signs, and landscaping.

Design standards contained within the community plan are intended to improve the overall appearance of the community through quality design in architecture and site layout. The standards promote a rustic mountain-oriented appearance such as log cabins or a turn-of-the...
The residents of the Upper Nisqually Valley are committed to retaining local ownership and do not want to be controlled by outside wealth. Reliance on or use of standardized corporate or franchise styles is prohibited. The design standards are required for all commercial and multifamily development within the three centers. All signs throughout the plan area are required to meet the standards. Standards address Site Design, Building Design, Signs, Planting Design, Lighting, and Street Furniture.

The Natural Environment Element includes consideration of the natural resources found in the Upper Nisqually Valley. Natural resources such as wildlife, clean water, forests, and open spaces are an integral and valued part of the community. The policies contained within the Natural Environment Element of the Upper Nisqually Valley Community Plan promote protection of critical areas, encourage preservation of natural vegetation, and address special topics such as waste disposal, air quality, and pesticides.

The Economic Environment looks at the economy of the Valley and considers a myriad of opportunities to diversify the economic base and capture more tourism dollars. The policies contained in the Upper Nisqually Valley Community Plan promote tourism, mountaineering, and sustainable forestry, and encourage coordination and marketing of recreational lands and resources.

Infrastructure and Services addresses the basic facilities needed to keep the whole system functioning. Infrastructure includes capital facilities such as roads, trails, sewage disposal, parks, and utility lines. The policies within the Upper Nisqually Valley Community Plan identify the capital improvements that are necessary to support the community plan (septic, water, rest area, sidewalks, etc.) and discuss potential partnerships and sources for funding opportunities.

The proposed Draft Upper Nisqually Valley Community Plan also contains amendments to the Pierce County Comprehensive Plan and Pierce County Development Regulations-Zoning so that the plan may be implemented upon adoption. Finally, the community plan contains a monitoring program that addresses how to measure the effectiveness and impacts of the plan over time.

**VISION STATEMENT**

Manage growth in the Upper Nisqually Valley, focussing on a rustic, mountain-oriented appearance in keeping with the historic and rural character of the area, while respecting private property rights.
Chapter 2: Land Use Element

**INTRODUCTION**

The purpose of the Land Use Element is to articulate a direction for future growth and development within the Upper Nisqually Valley. The adoption of policy statements forms the basis of land use regulations for the community and provides direction to residents, the business community, and investors. The Land Use Element also serves as a guide to decisions by the planners, Planning Commission, Hearing Examiner, and elected officials over private development proposals and the location of public facilities. The visions, goals, objectives, and policies of the Land Use Element of the Upper Nisqually Valley Community Plan direct growth into three centers. Two centers, Ashford and Elbe, are intended to serve the needs of local residents and tourists, while the Park Entrance is intended to cater to tourists. Directing commercial activity and higher density residential uses into centers allows the rest of the valley to retain its rural character and natural resources. Opportunities for home occupations, cottage industries and resource-based activities continue to be encouraged throughout the valley.

**DESCRIPTION OF CURRENT CONDITIONS**

As we approach the millennium, the Upper Nisqually Valley is a place where a rural way of life still prevails. Commercial business are small and locally owned, open space and expansive views are plentiful, and the population is not burgeoning. The following information provides background information on the existing land development patterns, population, and housing within the valley. Additional detailed information is available in the Draft Environmental Impact Statement, Community Growth Alternatives, Ashford/Elbe (Upper Nisqually) Gateway Community Plan, May 1997.

**CURRENT COMPREHENSIVE PLAN DESIGNATIONS AND ZONING CLASSIFICATIONS**

The plan area currently has four zoning classifications: Rural Neighborhood Center, Rural 10, Rural 20, and Designated Forest Land. In the 1994 Comprehensive Plan, the zoning for the County was the same as the Comprehensive Plan designations. Table K-1 shows how many acres are found in each zoning classification. Map K-2: Historic Land Use Designations/Zoning illustrates the locations of these designations/zoning.
Under the 1994 Pierce County Comprehensive Plan, Ashford and Elbe were designated Rural Neighborhood Centers (RNC). This designation is intended for small scale and light intensity commercial uses. RNCs are intended to provide limited convenience shopping and services which meet the daily needs of the residents of the surrounding area. All new development within this designation should retain a scale and intensity appropriate for maintaining rural character. Commercial uses are limited only to those which serve the surrounding local community. High density housing is not allowed.

<tr>
<td>Designated Forest Land</td>
<td>11,900</td>
</tr>
</tbody>
</table>

The Rural 10 (R10) designation is found throughout many areas of Pierce County. The designation is intended to maintain rural character and open space. It allows opportunities for resource-based industries such as agriculture, forestry, or mining provided these uses do not require urban-level services. Gas stations, stores, and retail shops are not allowed in the R10 designation. Residential densities allow a basic density of one dwelling unit per 10 acres. However, if at least 50 percent of the property is designated as open space, a density of two dwelling units per 10 acres is allowed. If at least 75 percent is designated as open space, a density of 2.5 dwelling units per 10 acres is allowed. The minimum lot size for any newly created lot cannot be less than one acre. Existing parcels that are less than 10 acres and are zoned R10 can be built upon as long as the other criteria such as septic, water, critical areas and other county requirements are met.

The Rural 20 (R20) designation is a fairly small portion of the plan area. It is located adjacent to Forest Lands and is intended to function as a transition zone between the R10 and Forest Land designations. The R20 designation, similar to R10, is intended to maintain rural character and open space. It allows the same opportunities for resource-based industries and the same bonus density incentives as the R10 designation. Existing parcels that are less than 20 acres and are zoned R20 can be built upon as long as the other criteria such as septic, water, critical areas and other county requirements are met.

The Forest Land designation is found on both public and privately owned land used for timber production. The designation is intended to preserve lands which are utilized for long-term timber production and minimize potential conflicts with other land uses. Uses are largely limited to resource-based industries and recreational activities, although residential homes and lodging are also allowed. The allowable residential density in the Forest Land designation is one unit per 80 acres, no bonus densities are allowed.
CURRENT LAND USES

A land use inventory was conducted for the Upper Nisqually Valley in early 1997 and updated in the summer of 1998. Using the Pierce County Assessor-Treasurer’s data for each tax parcel, information was gathered on current uses, acreage, and ownership. Table K-2 summarizes current land uses within the valley, and Map K-3: Historic Assessed Land Uses illustrates these land uses. Review of this information shows that most land development has occurred along SR706. Commercial uses tend to be concentrated in Alder, Elbe, Ashford, or the Park Entrance; however, there are a limited number of commercial activities between these centers.

The vast majority of the Upper Nisqually Valley Community Plan area is undeveloped; however, not all of these lands are available for development. Of the undeveloped lands, 58 percent of them are owned by either the State of Washington or the U.S. Forest Service. This land is managed strictly for timber harvest or recreational uses such as hiking, mountain biking, and cross-country skiing. Although the locations of these lands are primarily in the northern portions of the plan area, there are lands along SR 7 which are under State and Federal government ownership.

The Forestry category accounts for the privately owned lands which are in the County’s open space - timberland taxation program, are commercially harvested, or which are associated with forestry activities and services. Although there are numerous private individuals who own these lands, a little more than 50 percent are owned by either the Plum Creek Timber Company (roughly 950 acres) or the Champion Pacific Timber Company (roughly 1,500 acres). Champion provides recreational opportunities through cross-country ski trails and a fee access program.

The lands in the Forestry/Recreation category are owned by either the State of Washington (Department of Natural Resources) or the U.S. Forest Service. While much of this land is managed as productive timber land, the two agencies do provide various recreational opportunities such as hiking, mountain biking, and cross-country skiing.

Source: Pierce County Assessor/Treasurer’s Office data

*Because the northern plan area boundary is a ridge line and does not follow parcel lines, the acreages for the Forestry, Forestry/Recreational, and Open Space categories should be viewed as general estimates.

Vacant land makes up the second highest type of land use within the area. The Vacant category accounts for unimproved parcels and includes properties which have had dwellings removed or have abandoned activities such as farming.

Single-family residential development represents the majority of the developed environment. The single-family developments range from homes on large lots (five+ acres) to cabins on small lots in recreational subdivisions. The single family category, which includes both stick-built and mobile homes, is the primary type of residential land use.

The Agriculture category accounts for lands which are either in the County’s agriculture open space tax program, operating as farms or ranches, or grassland pasture. Although these lands are scattered throughout the plan area, the majority are located in the western portion and comprise the fourth highest type of land use.

The Transportation, Communication, Utilities land use category includes parcels which are primarily used for railroad right-of-way, highway and street right-of-way, automobile parking, telephone communication facilities, utility right-of-way, electrical substations or water utilities. The Alder Dam is the primary activity associated with these lands and is the reason this category results in the fifth most common type of land use.

A mix of other land uses are presently found within the plan area including education, public assembly, and open space (such as parks). It is important to recognize that commercial land uses presently occupy only 114 acres of the plan area. Commercial activities operated from a residence are not accounted for in this category. Most commercial activities are located near Alder, Elbe, Ashford, or the Park Entrance, with the exception of bed and breakfast facilities. A couple of commercial businesses are located between Ashford and the Park Entrance, including Guest Services Incorporated which is the concessionaire for the National Park and one of the largest employers in the valley.

**Commercial Businesses**

In 1995, an inventory was conducted of existing commercial businesses within the plan area. Table K-3 identifies each business and associated parcel size, floor area ratio, and square footage. Home occupations and cottage industries are not included in this inventory. As Table K-3 shows, there are approximately 87,000 square feet of commercial space in existence within the plan area. The majority of commercial businesses are in the lodging industry which caters to tourists and visitors to the National Park and surrounding Cascade amenities. The largest
commercial building is the Nisqually Lodge at 12,788 square feet. The lodge occupies less than 1/3 of an acre, and is almost 50 percent bigger than the next largest building which is the Gateway. The average size of a commercial building is approximately 3,200 square feet which is reflective of the rural character of the plan area.

### Housing

**Inventory**

The Pierce County Assessor-Treasurer’s records, as of November 1996, identified 613 homes in the plan area. Of the total, 570 homes are considered the primary use of the parcel. Of the remaining, 37 homes are associated with resource lands, such as farms and timber lands, and six homes are accessory to commercial uses. Sixteen properties contain two or more dwellings on one parcel. All of the homes are single family, with approximately 80 percent being stick-built and 20 percent being either single-wide or double-wide mobile homes.

The majority of the homes are located in the southern section of the plan area within the highway corridor. Thirty-seven percent of the homes are within eight subdivisions: Alpine Meadows, 30; Ashford, 25; Echo Valley, 57; Elbe, 9; High Echo, 7; Holiday Hill, 18; Lutkens 1st, 12; and

This information is based on census tract, census block, or census block group information. (Because existing census tracts and block groups include areas greater than the Plan Area, the information and trends described may not precisely reflect current conditions.) Approximately 27 percent of the population and households in Census Tract 732.00 live in the plan area. As a result, specific information for the plan area cannot be provided for 1970 and 1980. However, a comparison of the census tract does provide important information about the changes occurring in southern Pierce County, many of which are reflective of the plan area. Nisqually Park, 69. Paradise Estates, a subdivision in Lewis County, contributes another 150 homes to the area. Even though they reside in Lewis County, the Paradise Estates residents work, go to school, receive mail, and 911 protection from Pierce County.

A substantial number of homes are owned by individuals who live outside the plan area and use them for summer and weekend recreation. In the past few years, more of the recreational homes are being rented on a nightly basis to visitors. Although there is not a lot of documented
information available, it appears to be very difficult to find year-round or even long-term seasonal rental housing.

Compared to the urban portions of Pierce County, housing in the plan area is affordable for the average Pierce County resident. However, because of unavailable information about the annual incomes of the local residents, homes which are not available for year-round occupancy, and rental figures, it cannot be determined if the housing is affordable to the local community.

Approximately 85 percent of the housing is valued at less than $100,000 and 10 percent is valued less than $25,000.

**Vacancy**

The nature of the housing market makes it difficult to determine the current housing vacancy rate. Rental homes in the plan area are not typically managed through a professional property management company. Instead, private individuals manage their own homes or have an informal agreement with a private party to manage them. Information gathered from personal conversations with private parties indicates there are very few vacant homes available for year-round occupancy. In past years, a trend has emerged to rent homes on a nightly or weekly basis to tourists and visitors, rather than renting the homes for year-round occupancy.

According to census data, in 1990 the number of homes in the plan area totaled 469. A high percentage of residents owned their homes. Of the total 391 occupied homes, approximately 74 percent were occupied by owners and 26 percent by renters. The vacancy rate is 16.6 percent. However a large portion (41 percent) of those vacant homes was used for seasonal, recreational, or occasional use. The vacancy rate without subtracting seasonal and recreational housing is 6.9 percent.

**Demographics of the Upper Nisqually**

**Population Characteristics**

Who are the people of the Upper Nisqually Valley? A certain amount of information can be derived from the 1990 census information which shows the population in the plan area as 1,036 persons. Table K-4 illustrates a range of population estimates for 1996. The estimates in Table K-4 differ because of a varying year-round vacancy rate. Each of the estimates assumes: a total of 613 residential units; 26 percent of the residential units are used for seasonal use reflecting the total number of absentee homeowners; and 2.68 persons per household. The low estimate assumes a 6.9 percent vacancy rate for units available year-round. This assumption coincides with the conditions identified in the 1990 census. The medium estimate assumes a 2.0 percent vacancy rate for units available year-round. This assumption reflects the community's perception of available year-round rental units based on discussions with local residents and rental unit owners. The high estimate assumes there are no additional vacant year-round residential units available for rent or sale. This assumption also incorporates the community's perception based on discussions with local residents, but to the extreme limits. During the
summer months when the seasonal/recreational homes are likely occupied, the residential population in the plan area may increase by more than 400 people.

Source: Pierce County Planning & Land Services

The 1,036 people living in the plan area in 1990 reflect a very sparsely populated community. The gender ratio was split with males accounting for 52 percent of the population and females accounting for 48 percent. The dominant race category was white with 96 percent of the population. The American Indian category had the next highest portion with 1.8 percent, and the remaining race categories (black, Asian, other) each accounted for less than 1 percent.

The Upper Nisqually community has experienced a moderate amount of growth in the past 20 years. Between 1970 and 1990, the population of the census tract increased by a higher annual growth rate (2.5 percent) than the rest of Pierce County (1.7 percent) during the same time period. The population growth that has been occurring seems to be a result of in-migration, rather than new births and the "baby boomer" population is increasing at a faster rate than the younger population.

The 1990 census information shows that approximately 43.6% of local residents of the Upper Nisqually have a 30+ minute commute to work. This may be due to the limited employment opportunities in the Valley or it may be because housing is more affordable.

### Household Characteristics

Households are grouped into two categories; family and non-family. A family consists of an individual who is head of the household and is related by birth, marriage, or adoption to one or more other persons living in the same household. Not all households contain families since a household may comprise a group of unrelated persons or one person living alone. Seventy-four percent of the households in 1990 were categorized family households. The plan area contains an average of 2.64 persons per household which closely reflects Pierce County's average.

### Description of Desired Conditions

### Proposed Designations and Zoning Classifications

The community plan proposes five land use designations in the Upper Nisqually Valley to achieve the community’s goals: Rural 10, Rural 20, Rural 40, Forest Lands, and Gateway Communities.
Map K-1: Land Use Designations illustrates the proposed designations for the valley. The Rural 10 designation applies to the majority of the plan area and is not a new designation for the valley. The Rural 20 designation applies to land uses adjacent to designated Forest Land. The Rural 40 designation applies to an area in the southeastern portion of valley along the Nisqually River and is a new designation for the valley. The Forest Lands designation applies to timber lands owned by either the Washington State Department of Natural Resources or a major timber company. Most of the Forest Lands are located in the northeastern portion of the plan area. The Forest Lands are currently designated under the 1994 Comprehensive Plan and no changes to this designation are recommended.

The Gateway Communities designation applies to three proposed commercial centers: Elbe, Ashford, and the Park Entrance. Each of these three centers have a new zoning classification. The zones found in the Upper Nisqually are: Rural 10, Rural 20, Rural 40, Forest Lands, Village Center, Village Residential, and Tourist Commercial.

The Rural 10, Rural 20, Rural 40, and Forest Lands zones are the same as the comprehensive plan designation. The Village Center, Village Residential, and Tourist Commercial zones implement the Gateway Community designation and represent the first time the zone differs from the designation under the 1994 Comprehensive Plan.

Land use designations provide the boundaries for generally defined land use activities, such as commercial or residential. The zoning classifications that implement the designations provide the detail as to the type or scale of activity which is permitted. For example, within the Gateway Community designation, several zoning classifications may be established for different types of uses such as housing, commercial business, or industrial activities.

---

**The Rural 10 Designation and Zone**

The Rural 10 designation primarily accommodates low density single family residences. One zoning classification implements this designation--Rural 10. The Rural 10 is presently in existence throughout most of the plan area. There are no proposed changes to the allowed uses within this designation; however, there is less area zoned Rural 10 in the community plan. The Rural 10 designation encompasses approximately 11,360 acres as compared to the existing Rural 10 at 14,139 acres. Farming, ranching, and timber harvesting are allowed in this zone.

The policies and associated regulations for Rural 10 encourage accessory commercial or manufacturing activities if the operations do not negatively impact the character of the rural community. Although many small parcels exist within this area, the base density for new land subdivisions is 1 unit per 10 acres. Up to 2.5 units per 10 acres may be reached if specific open space provisions are met. Existing parcels that are less than 10 acres and are zoned R10 can be built upon as long as the other criteria such as septic, water, critical areas and other county requirements are met.

---

**The Rural 20 Designation and Zone**

The Rural 20 designation primarily accommodates low density single family residences. One zone implements this designation--Rural 20. The properties within Rural 20 are adjacent to...
Forest Lands. There are presently 510 acres of Rural 20 in existence in the plan area; this would not change under the community plan. There are no proposed changes to the allowed uses which are the same as the Rural 10 zone. The density for new subdivisions is 1 unit per 20 acres. Up to 5 units per 20 acres may be reached if specific open space provisions are met. Existing parcels that are less than 20 acres and are zoned R20 can be built upon as long as the other criteria such as septic, water, critical areas and other county requirements are met.

**The Rural 40 Designation and Zone**

The Rural 40 designation primarily accommodates low density single family residences. One zone implements this designation—Rural 40. This is a new designation within the plan area. The density for new land subdivisions is 1 unit per 40 acres. The properties subject to the Rural 40 designation/zoning are within Case II Volcanic Hazard Areas. The types of uses and activities allowed on properties are the same as Rural 10. The Rural 40 designation encompasses approximately 2,450 acres in the valley. The designation begins south of the highway at Elbe and continues to the entrance of Mount Rainier National Park. A few of the properties are on the north side of the highway. Although 95 percent of the existing parcels are already less than 40 acres in size, the parcels which may be further subdivided account for approximately 53 percent of the total acreage within this designation. Existing parcels that are less than 40 acres and are zoned R40 can be built upon as long as the other criteria such as septic, water, critical areas and other county requirements are met.

**The Forest Land Designation and Zone**

The Forest Lands designation applies to areas that have long-term significance for the commercial production of timber. These lands are regulated for the long-term production of timber and to ensure that the use of adjacent lands does not interfere with the continued use of timber harvesting. One zone implements this designation—Forest Lands. The density for new subdivisions is 1 unit per 80 acres. The types of uses and activities allowed on properties are related to commercial timber harvest operations and wood products.

The Forest Land designation encompasses approximately 11,900 acres in the valley. The designation begins northwest of Elbe and continues east to the boundaries of Mount Rainier National Park. Roughly 67 percent of the parcels within this designation are 80 acres or greater in size.

**The Rural Gateway Community Designation**

The Rural Gateway Communities designation provides for a mix of commercial, light industry, and higher density residential housing. The types of uses and activities allowed within the designation varies depending on the implementing zone. This designation applies to three historical commercial nodes in the valley which include Elbe, Ashford (including National), and...
the Park Entrance. Combined, these areas encompass approximately 847 acres within the valley.

Design standards for signs, building architecture, site design, landscaping, and street furniture would apply within each of the Rural Gateway Community centers. The standards would ensure the present character and uniqueness of the Upper Nisqually Valley is carried into the future. Design standards seek to bring forth the turn-of-the-century character, historic significance, or the rustic mountain log cabin character. They also ensure sites are developed with the least amount of environmental impacts as possible. Huge parking lots are prohibited through the standards, and buildings within the village centers would be located closer to the road with sidewalks connecting businesses. Signs throughout the valley are required to meet design standards.

Three zoning districts implement this land use designation. The implementing zones are: Village Center, Tourist Commercial, and Village Residential. The types of uses and activities allowed within each district vary. Table K-5 shows the zoning of each of the Gateway Community centers and how many acres are contained within each zone.

**Village Center Zone**

All of Elbe and portions of Ashford are zoned Village Center. The Village Center zone is intended to serve both residents and visitors to the valley. The Village Center zone provides for a mix of commercial, light industrial, and residential uses and activities. The commercial uses allowed within this zone are intended to provide an opportunity to property owners to establish businesses which encourage residents and visiting tourists to buy products within the Upper Nisqually Valley.

Commercial uses include but are not limited to: grocery stores; building materials and garden supplies; bulk fuel dealers; business services; eating and drinking establishments; distilleries, wineries, breweries, locally bottled waters; lodging; motor vehicles and related equipment sales, rental, repair and service; personal services; pet sales and services; rental and repair services; and sales of general merchandise.

The Village Center zone also allows for civic uses such as libraries, post offices, and medical offices which are not allowed within other zones. Locating civic activities within the same area as the commercial and residential uses is a mechanism to encourage residents to come in contact with each other more often to socialize and discuss community issues. The types of civic uses permitted include but are not limited to: administrative government services; day-
care centers; community and cultural services; education facilities; health services; religious assembly; public safety services; transportation; and utility and public maintenance facilities.

The Village Center zone is contained within a limited area. It is intended to be a compact mix of businesses and residential uses within an area connected by pedestrian facilities. Drive-through fast food restaurants are not allowed in this zone; customers would be required to get out of their vehicles to order and purchase products and services.

The transportation infrastructure created to serve the forest products industry of the last century still exists and can be utilized to serve the needs of the locally produced and manufactured natural resources abundant in the valley and re-establish the rail option to serve the increasing number of visitors of Mt. Rainier National Park.

The Village Center zone allows the highest residential density within the Upper Nisqually Valley—up to three units per acre. The absence of minimum lot sizes permits housing developers to cluster units together on smaller lots and create affordable housing opportunities within walking distance of shopping and employment opportunities. Dormitory-style employee housing is allowed to provide for long-term and short-term affordable housing for valley employees.

The plan proposes to rezone approximately 164 acres (144 parcels) to the Village Center zone in Elbe and Ashford. Ashford accounts for roughly 85 percent (approximately 184 acres) of the land in this district. Table K-6 shows the current land uses located within the Village Center zone and the number of parcels found in each type of use. The table demonstrates that in both Ashford and Elbe at the present time the majority of land is used for residential housing. Under the proposed Village Center zone, these lands may be developed as commercial or residential. Although the residential uses in Elbe are already on small lots, in Ashford 27 percent of the residential parcels are greater than 1 acre in size and account for 90 percent of the total residential land.

</tr>
</tbody>
</table>

*Vacant includes any lands that may be developed to commercial or residential uses under the community plan although these lands may presently be listed with the Assessor-Treasurer as a different use such as forestry or open space.

**Tourist Commercial**

The Tourist Commercial zone primarily provides commercial uses and activities oriented toward tourism. Although residents of the valley would also purchase goods and services from businesses within this zone, the uses are typically the types of businesses that would not survive without tourist shoppers. The types of commercial uses and activities allowed within
the Tourist Commercial zone include eating and drinking establishments, lodging; rental of recreational equipment, and sales of general merchandise. Rental of recreational equipment and sales of general merchandise are limited to 5,000 square foot shops. Employee housing is also allowed within the Tourist Commercial zone.

The Tourist Commercial zone applies to six parcels within the Ashford Gateway Community. The zone begins at the area known as Hewitt Airfield extending to the Overland Restaurant along the north side of SR 706. The Tourist Commercial zone also applies to 31 parcels located at the Park Entrance. The zone begins just east of Goat Creek at the Growley Bear Bed and Breakfast and continues on the north side of SR706 for approximately 1/4 mile, then continues on both sides of SR 706 to the entrance of Mount Rainier National Park.

The Tourist Commercial zone allows for residential uses, however, the density within the zone is the same as the surrounding rural residential zone. The Tourist Commercial zone at Ashford has a base density of 1 unit per 10 acres, reflecting the Rural 10 zone. The Tourist Commercial zone at the Park Entrance has a base density of 1 unit per 40 acres, reflecting the Rural 40 zone.

The plan proposes to rezone approximately 116 acres (37 parcels) to the Tourist Commercial Zoning district in Ashford and at the Park Entrance. The Park Entrance accounts for approximately 88 percent of the lands in this zone. Table K-7 shows the current land uses located within the Tourist Commercial zone and the number of parcels found in each type of use. The table demonstrates that, at the present time, in both Ashford and at the Park Entrance the majority of land is commercial.

**Table K-7: Tourist Commercial - Major Existing Land Uses**

</tbody>
</table>

*Vacant includes any lands that may be developed to commercial or residential uses under the community plan although these lands may presently be listed with the Assessor-Treasurer as a different use such as forestry or open space.

**Village Residential**

The Village Residential zone primarily allows for low density residential uses. Limited civic and commercial uses such as day-care facilities, and home-based businesses are also permitted. The base residential density is 1 unit per 10 acres. Up to 2.5 units per 10 acres may be reached if specific open space provisions are met. Table K-8 shows the current land uses located within the Village Residential zone and the number of parcels found in each type of use.

</tbody>
</table>

*Vacant includes any lands that may be developed to commercial or residential uses under the community plan although these lands may presently be listed with the Assessor-Treasurer as a different use such as forestry or open space.

The Village Residential zone would apply to 356 parcels and 148 acres within the Ashford Gateway Community designation. Approximately 75 percent of the parcels within this zoning district are vacant. Only 13 existing parcels are greater than one acre and of the 13, only one parcel is greater than 10 acres. The table reflects the large number of vacant lots found in Echo Valley subdivision.

**Future Land Uses in the Upper Nisqually Valley**

**Overview**

The pattern of land use in the Upper Nisqually Valley under the designations and zoning classifications would continue to reflect a rural development pattern with open space, natural areas, and large tracts of land. The most noticeable change would be the concentration of commercial businesses within the three rural commercial centers of Elbe, Ashford, and the Park Entrance. Because commercial uses are restricted to centers, there would be no new commercial businesses locating between the centers along the highway; therefore, strip development would not occur along SR 706. Existing commercial uses that are currently located along the highway, such as Copper Creek, would be allowed to expand as nonconforming uses in accordance with the Pierce County Code.

The most noticeable changes would be the growth of the Village Centers in Ashford and Elbe. These centers are intended to be the focal point of activity; pedestrian-friendly places where the community and visitors congregate, shop, and relax. A mix of commercial, light industrially zoned, and residential uses would be allowed and could be combined on a single parcel. No minimum lot size would be required. Residential uses would be allowed a gross maximum density of three homes per acre and could include multifamily housing. Employee housing would be allowed with no density limit. Residential housing would be allowed as an accessory to commercial uses. A community septic system would be considered for wastewater treatment in Ashford. In order to help create a community atmosphere and attract people to the centers, Tahoma Woods and the concessionaire would consider relocating employee housing to the village centers.

Over time, commercial businesses and light industry such as wineries and breweries, water bottling, etc would become the major land use within the Village Centers. Residential uses would likely follow close behind. Infrastructure and services such as sidewalks and crosswalks would support and encourage pedestrian use of the village centers. Design standards would ensure the present architectural character of the valley would be represented in the future.
Outside of centers, the Upper Nisqually Valley would not be expected to experience significant change. Homes, some with accessory commercial businesses, would continue to exist on large lots. The residential land use pattern in the Upper Nisqually Valley will continue to reflect a low density rural landscape. Some of the existing subdivisions will experience new home construction. Resource-based activities such as farming and forestry would continue throughout the rural zones.

Other significant changes to the valley would occur along the Hewitt Airfield strip and at the Park Entrance. The area known as Hewitt Airfield, extending to the Overland on the north side of SR 706, would be developed as tourist-related businesses. It is anticipated the existing residential homes and vacant properties will be redeveloped as restaurants, lodging accommodations, or other tourist-related commercial services. The existing businesses may be expanded to incorporate accessory tourist services. This business district is not required to have a pedestrian orientation.

The uses currently located at the Park Entrance are not anticipated to experience much change. However, some vacant land exists within this zone and would likely be developed with tourist-related businesses over time. Uses are restricted in this area to lodging, restaurants, sales of general merchandise, and rental of recreational equipment.

**Residential**

The proposed residential densities would maintain an overall density throughout the valley of one unit per seven acres. This overall density allows the community to retain a rural character while recognizing the demands and responsibilities of being a community that, simply by location, is a gateway to the National Park and numerous recreational public lands.

There will be more mixed residential/commercial uses on properties within centers. Within the centers, living areas could be an accessory use to commercial uses such as an apartment over a restaurant. More people are expected to reside within the village centers than currently reside in these areas; however, the rest of the valley will experience residential growth. In the rural zones of the valley, commercial activity would be an accessory use to residential homes as is presently the case.

The existing small lot subdivisions throughout the valley will slowly transform from seasonal recreational properties to year-round residences. More lots within these subdivisions will be developed with homes. Through the next 20 years as property owners retire, it is expected that a segment of them will relocate to the Nisqually Valley as permanent community members. In
addition, as the employment opportunities increase in the valley and the Eatonville area, the existing vacant lots in these subdivisions would be available to accommodate the associated growth at a lower cost than the larger lots. It is also acknowledged there will always be seasonal recreational property in the valley.

An increase in employment opportunities in the valley and Eatonville area may encourage property owners to subdivide existing agricultural and forest lands for residential purposes. The large residential lots (15 acres and greater) may also be further subdivided into smaller parcels, eight to ten acres.

The majority of homes built on these lots will be year-round residences with a few built as recreational homes. As a result of the open space density incentive provisions, homes associated with these properties may be clustered together to retain open space.

**Commercial Businesses**

New commercial development will be limited to the historical commercial nodes; Elbe, Ashford, and the Park Entrance. The type of commercial businesses in each of these centers would differ for each center. The Park Entrance would provide associated tourist lodging and other related services. Elbe and Ashford, located in the heart of the valley, would provide for a range of commercial services for both the local residents and tourists.

Commercial businesses are expected to become the dominant land use within each of the centers. Each of the centers contains a significant amount of vacant land and this change to the dominant use could happen quickly or slowly over time. New commercial businesses could be larger in scale than is commonly found in the valley at the present time. The square footage of individual buildings is expected to increase over the current building sizes. Size of new commercial buildings has generally not been limited in the community plan, except by that which is presently allowed throughout the rural area. These sizes generally allow up to 30,000 square foot store sizes. There are a few size limitations contained in the plan including sales of general merchandise and rental of recreational equipment in the Tourist Commercial zone is limited to 5,000 square feet.

New development would also influence the look of the valley because design standards would be required. These standards help the valley coordinate a cohesive character in new commercial and light industrial building that reflects the historic pattern of the area—porches, board-and-baton siding, log cabins, and use of natural materials such as timber, stone, and wood products.

**Public Facilities**

Public facilities may include roads, community centers, parks, and utilities. These facilities will be constructed on existing vacant properties or through redevelopment of existing structures. The majority of this change will occur within Ashford.
Housing

Overview

The number of single-family residential homes within the Upper Nisqually Valley is expected to increase over the next 20 years. The majority of new homes are expected to locate within the eight existing subdivisions or within the Village Center zone. The subdividing of property within the Rural 10 and Rural 20 zones is expected to continue at the current rate. Accessory dwelling units would be allowed throughout the plan area but would not significantly increase the number of homes within the valley. Employee housing, which is suited for seasonal, intermittent, or temporary employees may be constructed at a handful of locations.

The policies of the community plan allow and encourage housing that is affordable to valley residents. The community wants to ensure that with some new growth, local citizens will not be taxed out of their homes. Furthermore, the community would like to keep average housing prices within a reasonable range. As noted in the Existing Conditions text, presently approximately 85 percent of the housing in the valley is valued at less than $100,000. Housing prices and housing values are not anticipated to soar over the next 20 years.

New housing will occur throughout the plan area. Village Centers will accommodate some of the new housing, but existing subdivisions are expected to experience more development. In addition, lands zoned Rural 10, Rural 20, and Rural 40 are expected, in some instances, to be further subdivided and sold for single family homes. Residential housing is allowed throughout the plan area and all types of housing, whether located in a center or existing subdivision, are needed to meet growth projections.

The residential areas outside of the village core, including Echo Valley and High Echo, are not expected to change in character although are expected to see more buildout. The existing properties will not be further subdivided. There is the possibility of residents establishing home-based businesses, however, the limitations associated with operating a home occupation preserves the character of the single-family properties.

Employee Housing

The policies of the community plan and implementing regulations allow for employee housing. This type of housing is intended to provide an affordable means of housing for seasonal or temporary employees. There are restrictions placed on this type of housing so that it does not result in a low-cost permanent housing type. An applicant proposing to construct employee housing must demonstrate and document the need for the housing and have a mechanism to ensure the units are occupied by employees in the valley. Employee housing is distinguished by shared kitchen/dining areas as well as shared restroom/shower facilities. No more than 20 individual sleeping units per building shall be allowed with each unit requiring internal building access. Any provision for cooking facilities within an individual sleeping unit is prohibited.
**Projected Demographics**

Many variables make predicting the number of future residents in the Upper Nisqually Valley difficult. As in any type of projections, the smaller the geographical area and existing population base, the higher the margin of error will be over 20 years. Compounding the difficulty of completing projections is the existence of a large number of absentee homeowners and the proposed Mount Rainier Resort at Park Junction development. As a consequence, these projections should be evaluated every five years to review the assumptions and incorporate any new trends.

The projected year-round population for the Upper Nisqually Valley in 2018 is between 2,280 and 2,675 residents. This range of projections reflects an annual growth rate between 2.6 and 3.0 percent. The growth rate assumes increased year-round employment and a high percentage of homes being converted from recreational homes to year-round homes.

**Land Use Policies**

**Goals**

We envision a coordinated land use pattern which recognizes the constraints of the physical environment and directs growth into community-planned centers. We envision development that is scaled to a size and density that maintains the rural character of the valley as well as providing diversified employment opportunities with the centers for its residents.

**Gateway Communities**

Gateway Communities, and the zones that implement the designation, are intended to be the focal point of commercial activity in the Upper Nisqually. Any growth that occurs is intended to be directed to and contained within the three designated Gateway Communities. Rural Gateway Communities are not intended to sprawl in a linear fashion along a major arterial or highway, but be contained within a defined node. The three Rural Gateway Communities within the Upper Nisqually serve different and distinct purposes and therefore are implemented through three rural zones: Village Center, Village Residential, and Tourist Commercial. Each of the Rural Gateway Communities is required to comply with the adopted design standards.

**Village Center:** The intent of the Village Center zone is to provide for a compact mix of commercial, civic, light industry in locations where it has historically taken place, and higher density residential uses connected by pedestrian and transportation facilities. The zone serves both residents and visitors and is intended to function as a major attraction or main focus of the valley in which a hub of activities may be found.
Tourist Commercial: The intent of the Tourist Commercial zone is to provide limited commercial opportunities that are oriented to tourism such as restaurants, lodging, and rental of recreational equipment. The zone is not intended to provide civic activities or meet the daily shopping needs of residents.

Village Residential: The intent of the Village Residential zone is to recognize the existing subdivisions and land use patterns and to allow for residential uses to locate within a reasonable walking distance of commercial amenities such as shopping and services needed for everyday living. Limited civic activities such as daycares and home-based businesses are allowed.

GOAL UNV LU-1
Provide a coordinated land use pattern by directing growth and concentrated commercial and light industrial activities into community planned, pedestrian and transit oriented centers and allowing the rest of the Upper Nisqually Valley to maintain a rural character.

UNV LU-1.1 Designate a limited number of compact areas as Gateway Communities to accommodate the service and housing needs of residents, employees, and tourists.

UNV LU-1.2 A Gateway Community designation shall:

UNV LU-1.2.1 Have established commercial and other businesses catering to tourists and/or the local surrounding community; and

UNV LU-1.2.2 Have access onto a state route or major arterial, but not be developed in a linear pattern.

UNV LU-1.3 Respect the natural environmental constraints when designating Rural Gateway Communities and direct growth away from sensitive areas.

UNV LU-1.4 The Rural Gateway Communities should provide sufficient vacant and redevelopable land to allow new opportunities for growth and the market to determine sizes and uses consistent with the rural policies of the Comprehensive Plan.

UNV LU-1.5 A Rural Gateway Community shall be a compact and well-defined node.

UNV LU-1.6 Individual Rural Gateway Communities should be designated and sized to discourage the proliferation of commercial activity along the highway.

UNV LU-1.7 Rural Gateway Communities shall not allow for continuous linear strip development.

UNV LU-1.8 Commercial areas within the Rural Gateway Communities shall be consistent with the Limited Areas of More Intensive Rural Development.

UNV LU-1.9 Community goals shall be held above an individual’s interest when designating Rural Gateway Communities.
UNV LU-1.10 Elbe, Ashford, and the park entrance shall be designated as Rural Gateway Communities.

UNV LU-1.11 New Rural Gateway Communities within the Upper Nisqually Valley should not be designated within the 20-year planning period.

UNV LU-1.12 Within the existing Rural Gateway Community designations, properties that are currently zoned with a Rural Residential classification, may be rezoned to a Rural Center classification when:

- Environmental review is complete;
- It is an update to the community plan;
- The expansion area is contiguous with the existing center;
- The need to provide more land to reasonably accommodate development has been demonstrated;
- Infrastructure and services can be provided in the expansion area; and
- The size of the center will not negatively impact other areas in the community.

UNV LU-1.13 Rural Gateway Communities should not be expanded within the 20-year planning period to encourage infill development and redevelopment to provide opportunities for local employment.

UNV LU-1.14 Rural Gateway Communities shall not have more than one Village Center to focus development at the core and create a central place.

GOAL UNV LU-2 Identify the types of uses allowed within a Rural Gateway Community.

UNV LU-2.1 Allow commercial uses on the same parcel as residential uses within Rural Gateway Communities.

UNV LU-2.2 Uses allowed in commercial areas should encourage visitors to stop and get out of their personal vehicles.

UNV LU-2.3 Drive-through facilities should be discouraged.

UNV LU-2.4 Uses and activities which are land intensive and do not directly serve the community or tourists, such as agriculture or dairy farming, shall be prohibited in Rural Gateway Communities.

GOAL UNV LU-3 Develop zoning classifications which reflect the unique characteristics of the designated Rural Gateway Community.

UNV LU-3.1 The Rural Gateway Community designation shall be implemented through various zoning classifications.

UNV LU-3.2 The uses allowed in each zone should closely reflect the businesses, visitor-dependent businesses, natural resource manufacturing, and uses presently existing.
The Gateway Community designation shall be implemented through three types of zoning classifications: Village Center (VC); Tourist Commercial (TC); and Village Residential (VR).

The Upper Nisqually Advisory Commission, with community input, shall determine the optimum preferred alternative for National and revise the community plan to reflect the preferred alternative at the first update of the plan.

### Village Center

**GOAL UNV LU-4** The Village Center zone (VC) shall be located where the community has historically gathered, shopped, worked, and resided.

**UNV LU-4.1** The Village Center should be the focus of activity and create a central place.

**UNV LU-4.2** Encourage the Mount Rainier National Park and concessionaire to relocate employee housing to the Village Centers.

**UNV LU-4.3** Development located within the Village Center zone should be served by a community septic system and an authorized water purveyor such as a water district.

**UNV LU-4.4** Commercial, multifamily, subdivisions, and employee housing shall be required to provide pedestrian facilities such as crosswalks, boardwalks, and sidewalks.

**UNV LU-4.5** Maximum residential densities within the Village Center zone shall be 3 units per acre.

**UNV LU-4.6** Employee housing shall be allowed in the Village Center zone.

**UNV LU-4.7** Zone the Elbe Rural Gateway Community as a Village Center.

**UNV LU-4.8** Zone a portion of the Ashford Rural Gateway Community as Village Center.

### Tourist Commercial

**GOAL UNV LU-5** A Tourist Commercial zone shall be a small, clearly defined area that should not be allowed to expand within the 20-year planning period of this community plan.

**UNV LU-5.1** The Tourist Commercial zone (TC) shall be oriented to serve the needs of tourists with a focus on restaurants, general merchandise sales, rental of recreational equipment, restrooms, and lodging.

**UNV LU-5.2** Civic, industrial, recreational, office, business, and other such uses that do not directly serve a tourist population shall not be allowed in the Tourist Commercial zone.

**UNV LU-5.3** Residential densities in the Tourist Commercial zone shall be the same as the surrounding rural zone.

**UNV LU-5.4** Zone the Park Entrance Rural Gateway Community as Tourist Commercial. Maximum residential density at the park entrance shall be 1 unit per 40 acres due to the Case II Volcanic Hazard Areas. No bonus densities shall be allowed.
### Village Residential

**GOAL UNV LU-6**  
Village Residential shall be located where there is a predominance of existing residential uses in close proximity to a Village Center.

**UNV LU-6.1**  
Village Residential (VR) shall be a low density residential zone which provides open space within the Rural Gateway Community designation.

**UNV LU-6.2**  
The residential density in the Village Residential is one unit per 10 acres consistent with the surrounding Rural 10 designation.

**UNV LU-6.3**  
Zone a portion of the Ashford Rural Gateway Community as Village Residential.

### Residential and Resource Lands

Outside of the designated Rural Gateway Community, the Upper Nisqually Valley is not expected to experience much change. The valley is intended to remain as a mix of residential uses and resource-based uses. Residential uses would remain in large tracts of land; home-based businesses and cottage industries would continue to be allowed. Resource-based industries such as timber harvesting or agriculture would continue. The intent for zoning in the valley outside of Rural Gateway Communities, as Rural 10, Rural 20, Rural 40, or Forest Lands, is to allow for the rural character and large tracts of open space to continue into the future.

**GOAL UNV LU-7**  
Maintain the rural character of the Upper Nisqually Valley.

**UNV LU-7.1**  
Designate and zone areas outside of the Gateway Communities as Rural 10, Rural 20, or Rural 40 to encourage low density residential opportunities and maintain the rural character of the valley.

**UNV LU-7.2**  
The rural designations are intended to provide low density housing opportunities for residents of the Upper Nisqually Valley.

**UNV LU-7.3**  
High densities and intensive commercial uses shall not be allowed in the rural designations.

**UNV LU-7.4**  
Encourage rural business character by allowing home-based businesses and cottage industries.

**UNV LU-7.5**  
Encourage tourism by allowing bed and breakfast operations throughout the valley.

**UNV LU-7.6**  
Planned resorts shall not be allowed within the rural designations within the first five years of the community plan to allow for new development and redevelopment to occur within the designated Rural Gateway Communities.
**Rural 10 and Rural 20**

**GOAL UNV LU-8**  
Areas outside of any designated Rural Gateway Community and Case II Volcanic Hazard Areas shall be zoned Rural 10 or Rural 20.

**UNV LU-8.1**  
The base density of the Rural 10 lands should be 1 unit per 10 acres consistent with the Comprehensive Plan policies.

**UNV LU-8.2**  
The base density of the Rural 20 lands should be 1 unit per 20 acres consistent with the Comprehensive Plan policies.

---

**Rural 40**

**GOAL UNV LU-9**  
Areas outside of any designated Rural Gateway Community and within a Case II Volcanic Hazard Areas shall be zoned Rural 40.

**UNV LU-9.1**  
The base density should be 1 unit per 40 acres.

**UNV LU-9.2**  
Bonus densities shall not be allowed within Case II Volcanic Hazard Areas.

---

**Nonconforming Uses**

The intent of the nonconforming use policies is to recognize that the Upper Nisqually Valley contains a number of legally existing nonconforming uses that are allowed to continue operations.

**GOAL UNV LU-10**  
Recognize the importance of nonconforming uses consistent with the Pierce County Comprehensive Plan.

**UNV LU-10.1**  
Allow for continued operation and expansion of existing legal nonconforming uses.

**UNV LU-10.2**  
Recognize that Pierce County Development Regulations-Zoning allow for nonconforming rights of 10% expansion outright, up to 25% expansion with administrative review, and unlimited expansion with Hearing Examiner approval.

**UNV LU-10.3**  
Inventory and document existing legal nonconforming uses to expedite expansions.

**UNV LU-10.4**  
Expansions of nonconforming uses greater than 10% shall be required to meet design standards.

**UNV LU-10.5**  
Strive to bring illegally constructed businesses and buildings to code.

**UNV LU-10.6**  
Attempts should not be made to make all legally existing nonconforming businesses conforming.
### Affordable Housing

The intent of the affordable housing policies is to ensure housing remains within the means of the local citizens and the local wage scale. As growth occurs, residents do not want to be priced out of their homes and properties. The policies also recognize the need for special housing for seasonal, temporary employees.

**GOAL UNV LU-11** Encourage housing which meets the needs of the community and maintains community identity.

**UNV LU-11.1** Encourage housing that is affordable and attainable to all in the Upper Nisqually Valley.

**UNV LU-11.2** Higher density housing is to be located within Village Centers to maintain the rural character throughout the Upper Nisqually Valley.

**UNV LU-11.3** Allow for a density of 3 dwelling units per acre within Village Centers to provide opportunities for housing.

**UNV LU-11.4** Encourage housing as an accessory to commercial uses where commercial is located at the street front with residential above it.

**UNV LU-11.5** Develop procedures and regulations to allow employee housing within designated areas of the community.

**UNV LU-11.5.1** The intent of employee housing is to allow a low cost alternative for temporary employees and is particularly suited for a community that has seasonal employment housing needs.

**UNV LU-11.5.2** Employee housing shall not be implemented as multifamily housing; individual independent living quarters shall not be created, but common cooking and bathing areas shall be shared.

**UNV LU-11.5.3** Employee housing shall not be occupied by individuals who do not work in the Upper Nisqually Valley.

**UNV LU-11.5.4** Employee housing shall not be allowed in Case II Volcanic Hazard Areas.

**UNV LU-11.5.5** An applicant proposing to construct employee housing must demonstrate and document the need for the housing and have a mechanism to ensure the units are occupied by individuals who work in the Upper Nisqually Valley.

**UNV LU-11.5.6** Employee housing shall be required to be constructed and held in ownership by the company employing the workers or a cooperative of employers.

**UNV LU-11.6** Allow employee housing in the Village Centers and Tourist Commercial.

**UNV LU-11.6.1** Employee housing must be accessed through the inside of the building; cooking facilities and living spaces must be commonly shared by all with no provisions for cooking in any individual sleeping unit.
UNV LU-11.6.2 Employee housing shall not exceed more than 20 individual sleeping units per building.

UNV LU-11.6.3 Employee housing shall meet design standards.

UNV LU-11.6.4 Employee housing is encouraged to have commercial square footage on the first floor.

UNV LU-11.6.5 Monitor enforcement provisions for employee housing to ensure it is not used as rental units for tourists or other non-company employees living in the community.

IMPLEMENTING ACTIONS

The following is a list of actions that should be completed in order to implement the policies contained within this plan. They are arranged according to the timeframe within which each should be completed; short, medium, or long term. Short term actions should occur immediately or within one year of plan adoption. Mid-term actions should be completed within 2-5 years.

Long term actions should be completed within 5-20 years of plan adoption. The party or parties responsible for leading the effort to complete the action item is listed in parenthesis following the action. Actions are assigned to the Gateway Community Advisory Board (GCAB), the Upper Nisqually Advisory Commission (UNAC), or Pierce County Planning and Land Services (PALS). Those actions assigned to the GCAB are completed as part of the adoption and implementation of this plan.

SHORT TERM ACTIONS

1. Develop regulations to meet the intent of the goals, objectives, and policies of the community plan. (GCAB, PALS)
2. Amend the Pierce County Code to incorporate the regulations and zoning classifications for the Upper Nisqually Valley. (GCAB, PALS)
3. Amend the Pierce County Comprehensive Plan to designate and map Elbe, Ashford and the Park Entrance as Rural Gateway Communities. (GCAB, PALS)
4. Identify and map appropriate areas appropriate for expansion of zones within Rural Gateway Communities. (GCAB, PALS)
5. Designate and zone areas outside of any designated Rural Gateway Community and Case II Volcanic Hazard Areas as Rural 10. (GCAB, PALS)
6. Designate and zone areas outside of any designated Rural Gateway Community and within a Case II Volcanic Hazard Areas as Rural 40. (GCAB, PALS)
7. Establish a maximum residential lot size of 14,570 square feet in the Village Center zone to ensure compact development. (GCAB, PALS)
8. Develop regulations for employee housing. (GCAB, PALS)
9. The UNAC should consider whether to allow new Master Planned Resorts at the first update of the plan. (UNAC)
**Mid-Term Actions**

1. Develop procedures for amending the community plan. (UNAC, PALS)
2. Develop an official “Nonconforming Map” for those legally existing properties that are made nonconforming as a result of this plan. (PALS)
3. Develop a process which allows an allotted time period in which illegally constructed buildings and uses can be brought to the standards of the Uniform Building Code and Comprehensive Plan.
4. (PALS)

**Long Term Actions**

1. At each plan update, evaluate the provisions for employee housing to ensure the intent is met. (UNAC, PALS)

Chapter 3: Community Character and Design Element

**INTRODUCTION**

The communities within the plan area have developed over the years in close association with the abundant natural resources and natural beauty present in the Upper Nisqually Valley. This relationship is expressed in the development patterns, architectural styles, historic sites, commerce, and industry. These features create a unique environment for community identity and pride. Residents have determined a high priority should be given to recognizing and preserving the history and character of the area. The Community Character and Cultural Element addresses community character, heritage, and social interaction.

The Community Character and Cultural Element emphasizes the community's vision by setting forth goals and objectives related to the preservation of the historic, cultural, and natural characteristics of the area. It promotes the historic resources and seeks to renovate and preserve more historical sites in the valley. The element also outlines policies for design standards that will help bring out the unique architectural character of the valley. Social interaction is addressed to attempt to maintain the close-knit, stable community that is found in the Upper Nisqually Valley today.

**DESCRIPTION OF CURRENT CONDITIONS**

The Upper Nisqually Valley has a rich and colorful history that begins with Native American settlement and pioneer homesteading. In the 1880's, timber workers, miners, trappers, and farmers were attracted to the area. Because of the abundant forest resources, timber production became the primary economy and supplied the National Mill which was the nation’s largest mill west of the Mississippi. The virgin forests a century ago supplied the local mills with some of the largest trees on earth. Through the years, resource-based industries have continued to be a major component of the economy, however, tourism has also emerged as a significant economic component.

Residents of the Upper Nisqually Valley are independent, free spirited, creative, and respect the rights of individuals. Many businesses are independently owned and operated. The majority of business owners live in the Upper Nisqually Valley. The community is opposed to outside wealth invading their community and destroying their uniqueness with businesses and services.
as found throughout the rest of the United States. The community still works together and supports one another in any time of need. Residents are willing to volunteer on community projects and support community events. The citizens of the Upper Nisqually know the valley is a special place and want to ensure it continues to remain a special place in the future.

**HISTORIC RESOURCES**

Many historic sites exist within the Upper Nisqually Valley. Several historic properties in the community planning area are listed in the National or Pierce County Register of Historic Places. Historic properties are designated to historic registers only after determination is made that a property meets evaluation criteria concerning the property's historic significance and possession of integrity. However, even if properties are not eligible for the federal or county register, they may have local community significance.

In addition to individual historic significance, historic properties contribute to the overall character of the community. Each of the historic properties, including historic buildings and archeological sites, serves as physical evidence of the community's historical developmental pattern and the pride the citizens take in their past. The community's historic character provides linkages and continuity with the past and can also provide unifying themes for the community's future physical and economic development. The 20 properties described in Table K-9 are listed in the community plan to recognize local historically significant structures in the Upper Nisqually Valley. Four of the properties are either on the Pierce County or National Register of Historic Places.

These 20 properties were identified in an October 1996 workshop as having historical importance to the community. The top 20 properties were identified because they have the greatest potential of being placed on a historical register. Of the historic properties identified, ten were located in the Ashford vicinity, four in the Elbe vicinity, two in the vicinity of Alder, and three near the Nisqually entrance to Mt. Rainier National Park.
### Table K-9: Twenty Sites of Historical Importance

<table>
<thead>
<tr>
<th>Alder</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Alder Presbyterian Church, 50124 School Road, Alder.</strong> Built in 1920 and moved to the present location in 1947 as a result of construction of Alder Dam.</td>
<td></td>
</tr>
<tr>
<td><strong>Alder Schoolhouse (Alder Community Hall), South side on Highway 7, east of School Road, Alder.</strong> The four room schoolhouse was built in 1909 and a gymnasium was constructed four years later. Both were moved to the present site by the City of Tacoma due to the construction of Alder Dam. The schoolhouse is listed in the Pierce County Register of Historic Places.</td>
<td></td>

</tr>
</thead>
<tbody>
<tr>
<td><strong>Mount Rainier Lions Hall, 27726 Mountain Highway East, the Ashford vicinity.</strong> The hall is located where the town of National used to be. The building was built by the National mill workers as the union hall. Built before 1930's.</td>
<td></td>
</tr>
<tr>
<td><strong>Lovejoy's cabin, 54710 278th Ave. East, the Ashford vicinity.</strong> The cabin was the local speakeasy during the Prohibition Era of 1916 to 1933. Built date unknown.</td>
<td></td>
</tr>
<tr>
<td><strong>The National Mill Superintendent's House (Mountain Meadows Bed and Breakfast), 28912 Mountain Highway East, the Ashford Vicinity.</strong> Built in the early 1900's. Rexroth's House, 29805 Mountain Highway East, the Ashford vicinity. Built by the Rexroth Family in the 1920's. Mr. Rexroth was a local store owner in partnership with Mr. Butler.</td>
<td></td>
</tr>
<tr>
<td><strong>Mrs. Day Butler's House (Jasmer's), 30005 Mountain Highway East, Ashford.</strong> Built before 1920's.</td>
<td></td>
</tr>
<tr>
<td><strong>Butler's House, 30110 Mountain Highway East, the Ashford vicinity.</strong> Built by the Butler family in the 1920's.</td>
<td></td>
</tr>
<tr>
<td><strong>Ashford Tavern (Antique Store), 30027 Mountain Highway East, Ashford.</strong> The building was the local tavern, built in the late 1920's after the first tavern burned down.</td>
<td></td>
</tr>
<tr>
<td><strong>Von's General Store/Suver's General Store (Ashford Country Store), 30402 Mountain Highway East, Ashford.</strong> The store was built by Suvers in 1905 to serve Ashford.</td>
<td></td>
</tr>
<tr>
<td><strong>The Masonic Lodge, 30406 Mountain Highway East, Ashford.</strong> Built in the early 1920's. The lodge continues to be used by the local chapter of the Masons and a preschool.</td>
<td></td>
</tr>
</tbody>
</table>
The Ashford Mansion, 30715 Mt. Tahoma Canyon Road, Ashford. Built in 1903 by pioneers Walter and Cora Ashford. The mansion is listed in both the National and Pierce County Registers of Historic Places.

The Hershey Homestead, 33514 Mt. Tahoma Canyon Road, Ashford. The cabin was built in 1888 by homesteaders Peter and Emma Hershey. The cabin is the oldest structure still standing on its original site in the Upper Nisqually Valley. The homestead is listed in the Pierce County Register of Historic Places.

**Park Entrance**

Copper Creek Restaurant, 35707 Mountain Highway East, in the vicinity of the Nisqually entrance to the Park. The restaurant was converted from a 1935 gas station in 1946 by Rasalea Triggs and Hank Canty.

Mesler’s Inn (Alexander’s Country Inn), 37515 Mountain Highway East, in the vicinity of the Nisqually entrance to the Park. The Inn was built in 1912 by Alexander Mesler Junior. The Inn was one of the last road houses once located on the highway to Mount Rainier.

The Lodge, 38605 Mountain Highway East, near the Nisqually entrance to the Park. The lodge was built in the 1920’s by Tom Elliott.

**DESIGN**

Many of the commercial buildings and old homesteads in the Upper Nisqually Valley have a distinctive design and character that is representative of the different eras of development and economic dependence in the area. Although the architectural styles have changed decade by decade, the principles of historic design from the valley can be identified and applied to future development.

Several distinctive styles of design can be observed in the Upper Nisqually Valley. One of the most noticeable styles is that of pre-1900’s. Examples of such buildings are the Alder Presbyterian Church, Elbe Grocery, Elbe Lutheran Church, and the Ashford Country Store.

Another style is that of a mountain-oriented and rustic building character as is found in Whittaker’s Bunkhouse, Nisqually Lodge, Overland Inn, various rental cabin operations near Park Entrance, Gateway Inn, National Park Inn at Longmire, Paradise Inn, and Sunrise Lodge.

Finally, the Ashford Mansion and Alexander’s Country Inn are examples that represent a turn-of-the-century flavor. All of these styles contribute to the uniqueness of the area. There are several elements of design that are incorporated into many of the buildings, regardless of style, that serve to provide a sense of community. One of the common elements of good design present in the Upper Nisqually is the human component of many buildings and developments. These components make the building and property inviting rather than overwhelming or intimidating. Human components appeal to each of us and make us feel welcome. Soft lighting, covered porches, benches, and storefront windows invite people to shop, relax, and explore. Many buildings in the urban area are constructed of cement or cinder block and decorated with bright florescent lights. These colder elements are not inviting to people.

Parking lot design can be another element that can attract or deter people. Huge parking lots can be intimidating as cars dart around. Parking lots that are smaller with landscaping and
marked pedestrian pathways are more inviting to customers. Locating parking lots to the side or rear of a building can be helpful because a sea of parking does not have to be crossed to get to the destination. Very few buildings in the valley have large, intimidating parking lots.

The mass of a building also serves as an important design element. Large blank walls and massive buildings can make a person feel small and overwhelmed. Smaller buildings or walls that are detailed with dormers or windows can be more attractive to people. Most of the buildings in the Upper Nisqually are of a small scale (12,000 square feet or less) and have some kind of detail that encompasses the person rather than overwhelms.

The final design element that is unique to the Upper Nisqually is the signs. Most of the signs are handcrafted of natural materials such as timber logs or wood. Many signs are carved. Very few signs are internally lit or backlit. Whittaker’s Bunkhouse is an excellent example of a building which has incorporated many of the elements of good design. The building has soft, indirect lighting. There is a covered porch with benches that invites people to relax and spend some time. The building mass is broken up by the ‘L’ shape of the building that draws people in. The parking is located to the side. The sign is beautifully hand carved and is uniquely representative of Whittaker’s and the valley.

**VIEWSHEDS AND AESTHETICS**

Scenic views are almost constantly encountered as one passes through the plan area. Key scenic resources identified by the citizens of the area include Mt. Rainier, Cascade Mountains, Nisqually River, Alder Lake, Alder Dam, Nisqually River Canyon, heavily forested areas, pastoral settings, and open valley views. The State highways SR 7 and SR 706 provide the main travel routes for both residents and visitors in the plan area. Scenic views are part of what makes the valley special and set it apart from other areas in Pierce County.

**ALDER**

The Alder community has the appearance of a naturally evolved rural residential neighborhood with a small neighborhood store. The buildings are rustic and have a sense of a history. The first vista of Mount Rainier can be seen from just east of Alder Community Club and Alder General Store. When entering Alder, Alder Lake and the Nisqually River canyon can be seen from SR 7. North of SR 7 between the Eatonville Cutoff Road and the motel/RV park, pastoral settings characterize the landscape. East of Eatonville Cutoff Road going toward Holiday Hills, pastoral valley settings can be seen.

**ELBE**

The Elbe community has the appearance of a compact rural business district that serves the surrounding rural residents. The compact development pattern provides for a sense of place. Although there are a few modern looking buildings, the train creates a historic character for the Elbe community. From the SR 7 bridge, views of the Alder Lake inlet and the Nisqually River are seen. Views west of town showcase Alder Lake and mountains in Lewis County.
ASHFORD

With the absence of a centralized business district, the Ashford community has the appearance of a string of tourist businesses along a strip of highway. The vacant land, pastures, and rural residential housing patterns scattered among the businesses create a sense of unplanned development. Various locations in Ashford have views of the Cascade Mountains and their foothills. From the eastern area of Ashford, high Cascade peaks in Mt. Rainier National Park can be seen.

PARK ENTRANCE

Prior to entering Mount Rainier National Park at the Nisqually entrance, the roadway creates the illusion of a tunnel through a primarily undisturbed forested area. Although there is a string of tourist businesses along the roadway, the majority are situated away from the road in the trees and have a rustic appearance. The view west of the Park entrance from SR 706 looks upon the Cascade Mountains and Glacier View Wilderness area.

OTHER AREAS

Throughout the rest of the plan area, there is a mix of rolling foothills, open pasture, and hardwood and coniferous forests. Homes are scattered along the highway, many of which have a small business. One of the most beautiful views of Mount Rainier can be seen from the central valley in the area historically known as Park Junction.

CULTURE AND COMMUNITY RELATIONS

Like the pioneers that settled the Upper Nisqually, people of the valley today tend to be very private and individualistic people. Made up of mountaineers, entrepreneurs, and artisans, the citizens are creative and strong. People of the valley support one another and function as a cohesive community particularly in relation to outsiders such as tourists and other communities.

The community tends to be close-knit and generally people know one another. Sometimes the small, close-knit nature of the community amplifies disagreements among neighbors and has the potential to fracture the community if the issue is important enough.

The Upper Nisqually has very few community gathering places. Those that are available, the Alder Community Hall, the Lions Hall, the Masonic Lodge, the elementary school, and the fire halls, are too small to host a sizeable community function. The absence of a central gathering place, such as a community park or community center, is a concern to local residents.

There is not one particular group that speaks for the community, although there are several public interest groups in the area such as the Mount Rainier Business Association, Friends of the Ashford Park, Mount Rainier Lions Club, and Columbia Crest Parents and Teachers Organization. The community is divided on some of the more significant issues which creates difficulties for outside groups such as the County, the National Park, or the Forest Service to be of service.
DESCRIPTION OF DESIRED CONDITIONS

The citizens of the Upper Nisqually Valley want to preserve and build upon the assets that make the community unique: its rich and colorful history; its turn-of-the-century buildings, log cabins, and timber-built structures; its expansive views of the Cascade range, Nisqually River, and Alder Lake; and its ability to function and grow as a rural community. These are the elements that are addressed in the policies and regulations to ensure they are carried into the future.

HISTORIC RESOURCES

A rich and diverse history has shaped the Upper Nisqually Valley and contributes to the sense of community belonging found among the residents today. The people of the Upper Nisqually Valley want to ensure the history is preserved and conveyed to future residents and visitors through educating and promoting the history of events, people, traditions, unique structures, and artifacts.

The community plan supports the preservation of historic properties as well as finding ways to promote and teach that history to others. The policies and actions of the community plan call for emphasizing the importance of community history by developing a historic tour of properties, encouraging local businesses to have historic pictures or plaques, and increasing the number of properties listed on the historic register. The community also wants to educate visitors and citizens through the development of a museum or information center that contains historical context.

DESIGN

The community has numerous buildings that were built at the turn of the century or have a unique mountain-oriented character such as timber-built structures or log cabins. Examples of these unique buildings are discussed in the Description of Existing Conditions section of this chapter.

The community would like to have future buildings and development be constructed with the same styles and materials in order to enhance the existing character of the valley. The desired condition is to improve the overall appearance of the community, help provide a cohesive sense of community, and contribute to improving the economy by developing properties into more remarkable and inviting presentations.

Design standards contained within the community plan are intended to improve the overall appearance of the community through quality design in architecture and site layout. They will influence the architecture and site design in the valley and are intended to reflect the heritage
and existing historic character by utilizing rural, rustic, alpine, and/or Pacific Northwest/Cascadian design elements. The emphasis will be on craftsmanship, materials detailing, proportion, and mass of structural elements.

The goals of design standards are:

- to preserve, restore, and enhance the mountain-oriented, rustic, and rural qualities found in the Upper Nisqually Valley;
- to implement the goals and policies articulated in the Upper Nisqually Valley Community Plan;
- to encourage the enhancement and preservation of land or buildings of unique or outstanding scenic or historical significance;
- to encourage well designed buildings and sites;
- to size new buildings to the human scale;
- to provide a menu of design standards that allows a builder to choose from a variety of styles that fit the overall character of the valley; and
- to communicate to land use applicants the goals of the Upper Nisqually Valley Community Plan and the role that design review takes in implementing the plan.

The residents of the Upper Nisqually Valley are committed to retaining local ownership and do not want to be controlled by outside wealth. They value the locally owned, small businesses and cottage industries that are part of life and help to retain community bonds. The design standards discourage modern architectural styles such as big, box-type buildings with bright lights and large parking lots. Corporate or franchise style buildings that typically use tenant-specific motifs to promote a particular theme or to identify a specific tenant are prohibited within the Upper Nisqually Valley. Franchise businesses are welcome within the community plan area, but buildings must be designed to fit the unique historic character of the valley.

**VIEWSHEDS**

The Upper Nisqually Community is surrounded by beautiful views of the Cascade mountains and foothills and the Nisqually River Valley. The picturesque views found in the Upper Nisqually Valley provide a desirable transition between the urban areas of Puget Sound and Mount Rainier National Park. The visual corridor invokes pride in local residents. The desired condition is to maintain a natural and scenic environment that appeals to residents and visitors by protecting and enhancing views from SR 7 and SR 706. The community plan calls for consideration to develop viewshed guidelines to: retain or enhance positive characteristics; improve, remove, or screen negative characteristics; take advantage of opportunities to create positive visual diversity; and create vistas of attractive features where none exists. In order to achieve viewshed enhancement and protection, coordination with private timber companies, the DNR, and the forest service will need to be organized and pursued.

The community plan also contains polices to pursue abatement of illegally operating junkyards that detract from the natural aesthetics of the area. The residents of the Upper Nisqually Valley believe these business operations detract from the visual experience and, at a minimum, would like to investigate opportunities to screen junkyards from the roadways.
Preservation and protection of key open spaces and forest lands is another component of the Community Character and Cultural Element policies. The citizens would like to pursue opportunities to preserve and protect key open spaces such as those that provide habitat for wildlife, are historically important sites, or offer pleasing views of the Cascade range or the Nisqually River.

**CULTURE AND COMMUNITY RELATIONS**

The citizens of the Upper Nisqually Valley would like to improve opportunities for social interaction, cooperation, and information sharing within the community. In order to achieve this, the community plan calls for infrastructure projects that promote community interaction such as a community park, museum, and a community center facility. The citizens would also like to develop ongoing community events or periodic community forums which offer opportunities for dialogue.

The community plan also establishes an Upper Nisqually Advisory Commission (UNAC) that will be responsible for implementing the policies of the community plan and reviewing current development proposals for consistency with adopted policies, regulations, and design review. The Upper Nisqually Advisory Commission would be appointed by the Pierce County Council and would be comprised of a diverse group of individuals that represent the arts, business, environment, residents, forestry, and public lands. The UNAC should implement the community plan by working with citizens, local interest groups, the local business community, representatives of public lands, Pierce County, and other groups that may be necessary to aid with implementation steps. The UNAC would also work toward community education regarding the policies of the community plan.

**CULTURAL RESOURCES POLICIES**

The intent of the cultural resources policies is to emphasize the importance of history in providing a sense of place in the Upper Nisqually Valley and to preserve and prioritize historic structures, places, and traditions.

**GOAL UNV CR-1** Ensure the history of the Upper Nisqually Valley is conveyed to residents and visitors.

**UNV CR-1.1** Promote the history of events, people, traditions, unique structures, and artifacts.

**UNV CR-1.2** Promote the knowledge and presence of history in the community because it provides a sense of belonging and tradition for residents and visitors.

**UNV CR-1.3** Educate visitors and local citizens about the history of the valley.

**UNV CR-1.4** Weave historic themes into the economic development plans to encourage protection of historic character.

**UNV CR-1.5** Encourage the national park to provide historical interpretations of the relationship between the park and the local communities.
UNV CR-1.6 The UNAC should be afforded an opportunity to provide input into the review process when a nomination application to the Pierce County Register of Historic Places for a property located in the Upper Nisqually community is filed with the Pierce County Landmarks Commission.

UNV CR-1.7 Encourage local business decor to include historic plaques or pictures.

UNV CR-1.8 Develop a historic tour of important places and structures in the valley.

UNV CR-1.9 Develop standardized identification signs for historic tour properties.

UNV CR-1.9.1 Encourage property owners of historic properties and structures to be involved with the development of a tour.

UNV CR-1.10 Recognize that the valley contains many potential archaeological resources and ensure the provisions of RCW 27.53 are properly followed when development or site disturbance is proposed.

**DESIGN AND CHARACTER POLICIES**

**GOALS**

We envision a valley whose unique mountain-oriented, rural and rustic qualities are preserved and enhanced by using design to influence the character of the environment and by preserving places which are historically important to the community. We envision a close-knit, stable community that respects and values the individual while encouraging dialogue with one another.

**DESIGN**

The intent of the design policies is to ensure that new development enhances the visual quality and historic identity of the Upper Nisqually Valley while providing residents and visitors with a sense of place.

**GOAL UNV D-1** Preserve and enhance the unique characteristics of the valley through the influence of design.

UNV D-1.1 Improve the overall appearance of the community, help provide a cohesive sense of community, and contribute to improving the economy through the use of design standards and design guidelines.

UNV D-1.2 Design standards and design guidelines shall address:

UNV D-1.2.1 Signs (number, type, size, height, construction material, lighting);

UNV D-1.2.2 Lighting (type and design of parking and building lighting, intensity, direction);

UNV D-1.2.3 Street lighting (type and design, intensity, height);
Subdivision design (cluster design, orient away from valley roadways, reduce impacts on rural and mountain vistas);

Landscaping (require use of plants native or common to the valley and require preservation of a certain percentage of medium to large trees and the related understory in commercial centers, especially along roadway edges);

Site design (relationship between the buildings, parking, and roadways with environmental features of the site);

Streetscape (sidewalks, street furniture); and

Architectural design (roof pitch, building type, facade materials, colors, building appendages, window types).

UNV D-1.3

Require commercial development, light industry when adjacent to the highway visual corridor, employee housing, multifamily housing, mobile home parks, and signs to comply with design standards within centers.

UNV D-1.4

Require compliance with design standards for signs outside of centers.

UNV D-1.5

Design standards shall reflect the heritage and the existing historic character of the Upper Nisqually Valley by utilizing rural, rustic, alpine, and/or Pacific Northwest/Cascadian design elements.

UNV D-1.5.1

The emphasis should be on craftsmanship, materials detailing, proportion and mass of structural elements, and an organic quality.

UNV D-1.6

Modern architectural styles (1950s to present) such as large, box-shaped buildings are discouraged within the plan area.

UNV D-1.7

Store fronts should have covered entryways, walkways, roofs, or porch designs that protect pedestrians from the rain.

UNV D-1.8

Provide a set of incentives for new and existing structures to conform to the community’s design guidelines.

UNV D-1.9

While no single architectural style is required, reliance on or use of standardized corporate or franchise style is prohibited.

UNV D-1.10

Recognize the growing demands of tourist and the tourist industry by encouraging the development of existing properties into more remarkable and attractive presentations.

**VIEWSHEDS**

The intent of the viewshed policies is to recognize that views, viewsheds, and visual aesthetics are part of what sets the Upper Nisqually Valley apart from the rest of South Puget Sound. The policies are intended to emphasize to residents, visitors, and developers the importance of these aesthetics without creating burdensome regulations.

**GOAL UNV D-2**

Maintain a natural and scenic environment that appeals to residents and visitors.
UNV D-2.1 Recognize that the surrounding views of hillsides, mountains, the Nisqually River, majestic trees, and wildlife are part of what makes this valley unique by protecting and enhancing views from SR 7 and SR 706.

UNV D-2.2 Strive to achieve a corridor along SR 7 and SR 706, between Alder and the entrance to Mount Rainier National Park which is visually attractive to tourists, recreational visitors, local businesses, and residents.

UNV D-2.3 Roadways through the Upper Nisqually Valley should provide a pleasing diversity of residential, agricultural, commercial, light industrial, forest, and natural vistas.

UNV D-2.4 Recognize the visual quality of the corridor produces pride in local residents and creates a desirable transition from urban areas to Mount Rainier National Park.

UNV D-2.5 Consider developing viewshed guidelines to:

UNV D-2.5.1 Retain and/or enhance positive characteristics;
UNV D-2.5.2 Improve, remove, or screen negative characteristics;
UNV D-2.5.3 Take advantage of opportunities to create positive visual diversity where extensive areas of character exist;
UNV D-2.5.4 Create vistas of attractive features where none exist; and
UNV D-2.5.5 Guidelines should not be written with the intention of becoming regulation.

UNV D-2.6 Viewshed guidelines should provide recognition of positive accomplishments by landowners and managers.

UNV D-2.7 Coordinate with and inform the U.S. Forest Service, DNR, private timber companies, and business and property owners of the importance of maintaining attractive views.

UNV D-2.8 Pursue opportunities for creating new vistas or positive variations in visual character.

UNV D-2.9 Explore options to preserve and protect key open spaces and forest lands for natural aesthetic value.

UNV D-2.10 Work with public and private landowners to limit visual impacts on scenic resources.

UNV D-2.10.1 Discourage business activities associated with junkyards.
UNV D-2.10.2 Pursue abatement of illegally operating junkyards.
UNV D-2.10.3 Pursue opportunities to screen junkyards from the roadway.

UNV D-2.11 Recognize that the surrounding valley hillsides are part of working forests that can provide important views to Mount Rainier, the Cascades, and the Nisqually River.

UNV D-2.12 Identify key forest resource lands which should be preserved for viewshed protection.
COMMUNITY RELATIONS

The intent of the community relations policies is to emphasize the need for the community to speak with one voice and to work with public land managers for the betterment of the Upper Nisqually Valley.

GOAL UNV D-3 Improve opportunities for social interaction, cooperation, and information sharing within the community.

UNV D-3.1 Provide an atmosphere and infrastructure that promote community interaction.

UNV D-3.2 Provide central gathering places for the community through the implementation of Village Centers.

UNV D-3.3 Improve community cooperation, coordination, and communication through newsletters and periodic community forums.

UNV D-3.4 Support the development of a community park with a community center to meet recreational needs and provide a meeting place for local residents.

UNV D-3.5 Encourage local residents to participate in community events and volunteer activities.

GOAL UNV D-4 Establish an Upper Nisqually Advisory Commission to ensure that policies and actions of the community plan are implemented.

UNV D-4.1 The Upper Nisqually Advisory Commission (UNAC) should be comprised of a diverse group of individuals with representation from each of the Rural Gateway Communities, the arts and heritage, business, the environment, residents, forestry, public lands, and a non-voting member from Lewis County. The UNAC shall also contain a design professional, such as a landscape architect, architect, or planner.

UNV D-4.2 UNAC should implement the policies and action steps of the community plan by working with citizens, local interest groups, the local business community, representatives of public lands, Pierce County, and other groups that may be necessary to aid with implementation steps.

UNV D-4.3 The UNAC responsibilities should include:

UNV D-4.3.1 Implementation of the community plan and recommending policy changes to the Pierce County Council for final action;

UNV D-4.3.2 Review of development proposals to ensure that community character and standards are maintained and the policies of the community plan are put forth. The UNAC will complete findings and recommendations to the Hearing Examiner or Planning and Land Services Department director as appropriate; and

UNV D-4.3.3 Community education and coordination toward implementation of the community plan.

UNV D-4.3.4 Pierce County should assist and provide staff support to the UNAC.
IMPLEMENTING ACTIONS

The following is a list of actions that should be completed in order to implement the policies contained within this plan. They are arranged according to the timeframe within which each should be completed; short, medium, or long term. Short term actions should occur immediately or within one year of plan adoption. Mid-term actions should be completed within 2-5 years.

Long term actions should be completed within 5-20 years of plan adoption. The party or parties responsible for leading the effort to complete the action item is listed in parenthesis following the action. Actions are assigned to the Gateway Community Advisory Board (GCAB), the Upper Nisqually Advisory Commission (UNAC), or Pierce County Planning and Land Services (PALS). Those actions assigned to the GCAB are completed as part of the adoption and implementation of this plan.

SHORT TERM ACTIONS

1. Appoint members to the Upper Nisqually Advisory Commission ensuring a mix of representation. (PALS)
2. Set a regular meeting time and place for UNAC meetings. (UNAC)
3. Develop a two-year and five-year work program for policy implementation, public education, and plan monitoring. (UNAC)
4. Provide staff support for the UNAC in design review of proposed projects. (PALS)
5. Develop and adopt design standards for centers. (GCAB, PALS)
6. Develop and adopt design guidelines for use outside of designated centers. (GCAB, PALS)

MID-TERM ACTIONS

1. Convene a community forum to educate local property owners about the use of design standards and design guidelines. (UNAC, PALS)
2. Coordinate with and inform the Pierce County Landmarks Commission regarding adopted design standards and guidelines. (UNAC)
3. Periodically review the effectiveness of design standards and guidelines toward achieving the preservation of community character. (UNAC)
4. Adopt a set of incentives for compliance with design guidelines for new and existing structures by:
   • Researching possible incentives;
   • Developing alternatives;
   • Convening a community forum to solicit public comment; and
   • Completing any regulatory changes which would be necessary to implement incentives. (UNAC, PALS)
5. Work with individual businesses to suggest ways of improving site and building presentations.
6. Research the possibility of designating portions of the valley timberlands as a pilot project area as a means to provide research opportunities and preserve forested areas. (UNAC, DNR, USFS, National Park)

7. Within five years, adopt the list of Historically Important Features to be emphasized:
   - Identify all sites, events, people, traditions, structures, and artifacts of historical significance;
   - Develop educational brochures, tours, presentation to emphasize the historical list; and
   - Develop strategies to convey the historical information to the community. (UNAC, community)

8. Work with the National Park, historians, local citizens, and businesses to obtain historical photos and artifacts to place into local businesses as part of the decor. (UNAC, business association)

9. Publish periodic community newsletters and establish an Internet bulletin board to inform residents of upcoming community events, the history of the community, the status of community plan implementation, land use proposals under review by the Upper Nisqually Advisory Commission, introduction of new business people, or change in existing businesses, etc. (UNAC)

10. Hold periodic community get-togethers (e.g., picnics, ice cream socials) to introduce existing and new residents to one another. (UNAC, community, business association)

LONG TERM ACTIONS

1. Work with the U.S. Forest Service, the National Park Service, the Dept. of Natural Resources, and private landowners when considering development of a valley viewshed plan that maintains, enhances, or creates important views by:
   - Coordinating a forum which brings together community residents and public agencies to identify key forest resource lands which should be preserved; and
   - Develop visual quality objectives and viewshed guidelines for preservation of viewsheds; and,
   - Develop a five year assessment program to determine whether viewshed guidelines are effective. (UNAC, U.S. Forest Service, National Park, DNR)

2. Develop incentives such as residential density bonuses, tax incentives, or an incentive award program to encourage compliance with viewshed preservation and maintenance. (UNAC)

3. Work with the Department of Transportation to strengthen enforcement of existing scenic highway regulations for SR 7 and SR 706. (UNAC, Pierce County)

4. Work with the Washington State Department of Transportation's Heritage Corridors Program to develop a corridor management plan for SR 7 and SR 706 that articulates the community's vision and goals for the scenic roadway. The corridor management plan should document the resources of the corridor and specific action strategies designed to preserve and enhance them. (UNAC, Pierce County) Apply for a National Scenic Byway
and All-American Road designation at the Federal level which would recognize SR 706 for its outstanding qualities and amenities. (UNAC, Pierce County)

5. Coordinate with the National Park to develop a program to plant native wildflowers along SR 7 and SR 706 to beautify the trip to the mountain. (UNAC)

6. Identify and pursue acquisition of key open spaces and cultural sites:
   - Identify open spaces important to the community;
   - Prioritize the list of identified open spaces;
   - Investigate funding opportunities to purchase or preserve open spaces; and
   - Purchase property or development rights for property which has significant aesthetic, historic, or cultural value. (UNAC, Pierce County)

7. Work to expand the list of Historically Important Features, including archeological resources, for the Upper Nisqually Valley in the Pierce County Register of Historic Places. (UNAC, PALS)

8. Develop a historic property tour:
   - Compile an inventory of all the historical properties and structures in the Upper Nisqually Valley;
   - Solicit local residents to design a brochure which maps the historic properties and structures and provides its historic relevance;
   - Solicit funds to print and distribute the tour brochures;
   - Solicit local residents to design a standard sign to be placed at the historical properties and structures; and
   - Solicit funds and/or resources to construct the signs. (PALS, UNAC)

9. Disseminate information regarding tax incentives for rehabilitating or restoring historic properties. (UNAC)

10. Educate the community about the advantages of rehabilitating or restoring historic properties. (UNAC)

11. Pursue the development of a museum to illustrate, preserve, and centralize the community history. (UNAC, business association)

12. Develop a program that presents the history of the community to visitors, local schoolchildren, and residents. (UNAC)

13. Investigate the possibility of the Pierce County Landmarks Commission review and influence any proposed changes to or demolition of properties listed on the community plan list of historically important features until eligible properties on the community plan list are formally designated to the Pierce County Register of Historic Places. (UNAC, Pierce County Landmarks Commission)

14. Pursue the development of a community park with a community center. (UNAC, business association, Pierce County)
Chapter 4: Natural Environment Element

INTRODUCTION

The Natural Environment Element addresses the protection and conservation of the natural resources such as water, air, forests, vegetation, fish and wildlife, and other critical areas. The residents of the Upper Nisqually Valley value the surrounding natural environment and intact ecosystems as an integral part of who they are and what makes the community unique.

Residents believe the Upper Nisqually Valley is “blessed with some of the world’s most majestic scenery, favorable climates, abundant wildlife, pristine air, and soil and water”. The citizens want to “be the community that preserves and protects our special place for the experience and appreciation of others and future generations”.

Protection and preservation of critical areas, other environmentally sensitive areas, air and water quality, and sustainable natural resources are key components of the community's vision. A number of environmental protection strategies are identified within the element including establishing land use practices which protect critical areas, preserving the environment in its natural state to the greatest extent possible, maintaining or improving the quality of air and water resources, encouraging forest management which promotes sustainable harvests, limiting pesticide use, and developing educational and community outreach programs which further the awareness of environmental issues.

DESCRIPTION OF CURRENT CONDITIONS

The unique environment found in the Upper Nisqually Valley is one of the area's most defining characteristics. The majestic Cascade hillsides, expansive views, and dignified conifers can stir a mix of humility and awe. But it is more than this that makes the Valley unique--it is the lingering morning fog along the river, the fresh smell of cottonwoods on a summer’s evening, watching the elk quietly feeding in a pasture, all of the lush vegetation and greenery, seeing a thousand stars at night, and an ongoing peaceful solitude. This is what the residents of the Upper Nisqually want to preserve for future generations.
EARTH RESOURCES

LANDSLIDE AND EROSION HAZARD AREAS

The plan area contains a variety of slopes ranging from practically level to extremely steep. The portion of the plan area containing slight slopes, i.e., 0-8 percent, is located on the floor of the river valley, from Elbe to the entrance to Mount Rainier National Park. Moderately steep slopes, i.e., 15-30 percent, are found predominantly in the Elbe Hills, north and east of Elbe and on lower hillsides in the west end of the plan area. Isolated areas of moderately steep slopes are also found in the mountainous areas at the east end of the plan area. Steep slopes, i.e., 30-65 percent, dominate the Cascade Mountains north and east of Ashford and are common on the sides of the Elbe Hills, Alder Hill, Reliance Hill, and other outcrop hills in the west end of the plan area. The areas of very steep slopes, i.e., 65-90%, are mostly confined to the upper reaches of peaks and outcrops in the Cascade Mountains north and east of Ashford. Areas most susceptible to landslide and erosion hazards occur on steep and very steep slopes.

SEISMIC HAZARD AREAS

Areas vulnerable to seismic hazards which could result in severe damage to life or property typically include alluvial surficial geologic units or recessional outwash surficial geologic units. Maps released by the Washington Department of Natural Resources in 1987 show there are isolated areas of alluvium geologic units located at the east and west ends of the plan area. Alluvial deposits are found in three pockets along the shore of Alder Lake in the Cemetery Road area. A large area of alluvium is located in the Nisqually River and Tahoma Creek drainages to the east of the plan area boundary in Mount Rainier National Park, with the western end of the deposit located in the plan area at the Nisqually Park Subdivision. There are alluvial-based soils on the Nisqually River valley floor that may also be unstable.

VOLCANIC HAZARD AREAS

Portions of the plan area are subject to potentially catastrophic impacts from activities originating on the Mount Rainier volcano. Due to its height, frequent earthquakes, active system of steam vents, and extensive glacial system mantle, Mount Rainier is potentially the most dangerous volcano in the Cascade Range. There are several types of hazards associated with volcanoes such as Mount Rainier. These include ash eruptions, lava flows, pyroclastic flows, and lahars (also known as mudflows or debris flows). In addition, glacier caused mudflows and traditional mountain flooding are relatively common within the plan area. Lahars and mudflows can occur without any volcanic activity and with little or no warning. Lahar and mudflow hazards present the greatest risk to the inhabitants and visitors of the Upper Nisqually.

Mount Rainier and the Nisqually River Valley have experienced numerous debris flows in postglacial times (over the past 10,000 years). Mount Rainier poses the most severe debris flow risks of any volcano in the United States. The Upper Nisqually Valley has historically experienced a number of debris flows. Debris flows can be defined as slurries of sediment and
water that look and behave much like flowing concrete. A debris flow contains 60 percent or more sediment, with the remaining volume composed of water. There are two types of volcanic debris flows (lahars): (1) "cohesive," relatively high clay flows originating as debris avalanches; and (2) "noncohesive" flows with less clay that begin most commonly as meltwater surges.

**COHESIVE (CASE I) DEBRIS FLOWS**

The largest debris flows to occur on Mount Rainier have been cohesive flows that began as debris avalanches formed from huge volcanic landslides. The potential suddenness of these debris flows means little or no warning to those downstream. It would take less than two hours for one of these large debris flows to reach Ashford and Elbe. These lahars have occurred at Mount Rainier at a frequency of once every 500-1,000 years. The Electron Mudflow inundated the Puyallup River Valley, downstream to Sumner, to a depth of over 20 feet approximately 550 years ago. A similar event has a 10-18 percent probability of occurring within the next 100 years in the river valleys leading from Mount Rainier, including the Nisqually.

The U.S. Geological Survey, in analyzing the risk and impacts of debris flows on the river valleys surrounding Mount Rainier, has determined that a flow the size of the Electron Mudflow is a reasonable event to assume. In the case of the Nisqually River Valley, scientists estimate a debris flow the size of the Electron would inundate the valley floor and lower hillsides of the upper stretches of the valley, east of Elbe. The depth of the flow would range from approximately 50 feet at the base of the volcano to 22 feet at the lowland end of the debris flow. An Electron-size debris flow is estimated to have speeds of 11-49 miles per hour with an estimated arrival time at Alder Lake of between 0.6 and 2.5 hours.

**NONCOHESIVE (CASE II) DEBRIS FLOWS**

Noncohesive debris flows have occurred much more frequently at Mount Rainier than the cohesive debris flows, i.e., at a frequency of once every 100-500 years. A noncohesive debris flow has a 64 percent probability of occurring at least once in the next 100 years. Noncohesive debris flows most commonly originate as water surges from the melting of snow and ice by volcanic heat, lava, or pyroclastic flows. These flows begin as streamflow and gradually increase in bulk as sediments accumulate along the path of the flow until the flow contains a significant amount of sediment. The Nisqually River Valley has experienced several noncohesive debris flows in post-glacial times.

The largest noncohesive debris flow in the Mount Rainier area, the National Lahar, inundated the lower river valley all the way to Puget Sound. The U.S. Geological Survey, in analyzing the risk and impacts of debris flows has determined that a noncohesive debris flow the size of the National Lahar is a reasonable event to assume. In the case of the Nisqually River Valley, another debris flow the size of the National is estimated to inundate a portion of the valley floor, east of Elbe.

The valley portion of the plan area, east of Copper Creek, and within approximately 0.25-0.50 miles of the river, east of Elbe, would be the most susceptible area. The depth of flow would range from 15 feet at the base of the volcano to 8 feet at the lowland end of the debris flow.
Debris flows are estimated to have speeds of 7-18 miles per hour with an estimated arrival time at Alder Lake of between 1.6 and 4.2 hours.

**WATER RESOURCES**

**WATERSHED IDENTIFICATION**

The community plan area is located within the Nisqually River Watershed. All waters in the area eventually flow to the Nisqually River. The river originates at the Nisqually glacier on the south side of Mount Rainier and ultimately reaches the Nisqually Delta entering Puget Sound some 70 miles to the west. The watershed contains 720 square miles.

The Nisqually River serves as the boundary between Pierce and Lewis Counties. It is the fifth largest river entering Puget Sound and provides fifty percent of the discharge into the South Sound below the Tacoma Narrows. The upper 28 miles of the Nisqually River have been identified by the National Park Service as a potential wild, scenic, or recreational river. The Washington Department of Ecology has classified the whole river as having statewide significance under a state scenic waterway program and under the Nisqually River Management Plan.

Most tributaries to the Nisqually within the upper sub-watershed exhibit steep mountain stream characteristics, producing falls, cascades, and rapids with large rock or boulder stream bottoms. Most tributaries are surrounded with dense cover, usually deciduous trees and underbrush with some conifers. Goat, Copper, and Mueller Creeks are major tributaries within the plan area (see Map K-4: Water Resources). The principal land uses within the Upper Nisqually are rural residential homesites, timber harvest activities, and recreation. The area is rural in character with a few small communities such as Ashford and Elbe. Potential pollution sources include forest practices, stormwater runoff, and sewage disposal.

**WATER QUALITY**

The Nisqually River is relatively cool and well oxygenated. The river is clear much of the time. Glacial melt occurs sporadically during the summer and fall causing seasonally high suspended solids and turbidity. Logging activity may increase erosion and possibly lead to increases in turbidity during storm events. Upstream water temperature warms during July, August, and September, occasionally exceeding the State temperature standard.

Rainfall, snowmelt, and glacial melt provide the principal runoff to the Nisqually River. Glacial meltwaters, laden with rock flour (finely-ground rock formed when glaciers move over bedrock), cause seasonally high suspended solids and turbidity which reduce the clarity of the river. Fine glacial sediments give the river a milky green color in late summer. Washington Department of Ecology (WDOE) classifies the Nisqually River upstream of Alder Lake as having extraordinary water quality. Alder Lake water quality sustains resident fish populations and does not appear to be substantially degraded by sediment deposition. Nutrient concentrations are below EPA criteria. There is no evidence of toxic substances in lake sediments. Potential
sources of pollution in the area include stormwater runoff, erosion and sedimentation, agricultural runoff, and forest practice activity.

No specific data is available on the water quality of many smaller tributary streams to the Nisqually River. However, their quality is generally assumed to be excellent because their flows enter the Nisqually River which has extraordinary water quality.

**Flooding**

The powerful force of water rushing downstream causes rivers to move and change their course over time. The river has significantly changed course in the last 100 years since the Pierce/Lewis County lines were established. Flooding creates new channels in upland areas and erodes river banks, displacing homes and land.

Flow volumes in the upper half of the Nisqually, above Alder Reservoir, result solely from runoff and snow melt into the tributaries. The river experiences seasonal fluctuations in discharge; high flows in April, May, and June correspond to snowmelt, and high flows in November through February correspond to heavy rains. Lowest flows typically occur in August and September.

Occasionally, high flows occur in late summer or early fall because of rapid glacial melt in the headwaters of the river. These glacial outbursts, known as jokulhlaups, have historically caused flooding along the Nisqually. The outburst is caused by a sudden release of a large amount of water from the head of a steep mountain valley containing loose alluvial glacial deposits. The massive outpouring often results in one or more surges flowing downstream and carrying boulders, trees, mud, and huge amounts of debris. Floods caused by glacial outbursts are known to have occurred on the Nisqually in 1926, 1932, 1934, 1947, 1955, and 1986.

There is an extensive history of flooding along the Nisqually River. Pierce County records show a flood occurred in January 1959 that provided the impetus for construction of a dike that extends from Mount Rainier National Park to just beyond the Nisqually Park subdivision. The dike was built in 1961. In 1962, the Kernahan Bridge was damaged in a flood. In early December 1977, eight homes and twelve lots in the Nisqually Park subdivision were destroyed when a flood destroyed the dike. The Army Corps of Engineers subsequently rebuilt the dike. In February of 1996, the landward portions of the Kernahan Bridge (which had been rebuilt in 1994), were wiped out in a flood event.

Portions of the plan area reside in 100-year and 500-year floodplains. Most of the 100-year floodplains are associated with the Nisqually River and form some of the streams that empty off the hillsides into the river. Land in a 100-year floodplain is subject to a one percent or greater chance of flooding in any given year. The 500-year floodplains are minimal, but do exist near the Park Junction site and some of the streams near Kernahan Road.

**Hydroelectric Dams and Reservoirs**

Two large hydroelectric dams, located at Alder and LaGrande, influence the planning area. The dams and their associated reservoirs have significantly altered the flow of the Nisqually River.
Each facility consists of a dam, flowline, powerhouse, and an associated power transmission switchyard. Alder and LaGrande are considered part of the Nisqually Hydroelectric Project.

Tacoma Power owns the facilities and in 1996 applied to the Federal Energy Commission for relicensing. Approval of the relicensing occurred in early 1997. As part of the approval, several changes were made in regard to flows, fish, wildlife, and recreation. Tacoma Power is purchasing 3,350 acres of land to be set aside for wildlife habitat and protection. These lands are meant to help mitigate the impacts of lost habitat because of the reservoirs. In addition, the LaGrande bypass reach will be opened for recreational whitewater rafting several days a year.

**Wetlands**

The community plan area has a considerable number of wetlands. Most of the wetlands are associated with the Nisqually River or its tributaries (see Map K-4: Water Resources). There are several wetlands located north of SR 706 approximately two miles east of Elbe. There is a large wetland situated between Ashford and Elbe, approximately three miles west of Ashford and north of SR 706. Several more wetlands exist immediately west of Ashford. Wetlands in the Upper Nisqually watershed have experienced minimum disturbance and are in relatively good condition.

**Groundwater**

Most of the soils found in the valley are sandy loam, gravelly loam, or sand. Permeability of these soil types is moderate to high. Groundwater is generally more susceptible to contamination in areas with permeable soils because contaminants are not effectively filtered before reaching the aquifer. However, the valley floor is underlain by unconsolidated alluvial and mudflow deposits which rest upon bedrock consisting mostly of volcanic breccias and flows. Due to these deposits, the Nisqually Valley has a complex subsurface geology. At this time, no geohydrologic models exist which describe the horizontal and vertical characteristics of the subsurface geology of the Valley, thus making it difficult to assess the susceptibility of the aquifer.

In October of 1963, the Ground Water Branch of the U.S. Geological Survey was requested by the National Park Service to drill a well approximately 3-1/2 miles east of Elbe, in conjunction with plans for the new headquarters site. The report concluded that the amount of groundwater stored in the valley alluvium fluctuates in close response to precipitation and snow melt. Water quality analysis of samples taken during the pumping test showed that the water was of excellent chemical quality.

**Vegetation**

The plan area has a mix of forests, pastures, and river plains. The west end of the plan area, west of the Cascade foothills, contains a mix of pasture, farmfields, clear cuts, meadows, and mixed deciduous/coniferous forest. The Elbe area is characterized by forested hillsides to the north and east of the townsite. The stretch of valley floor extending east a couple of miles contains a mixed deciduous/coniferous forest. The central portion of the valley floor, from the Park Junction area to National, is characterized by broad openings, mature/second growth...
forest, and clearcuts. In the vicinity of National, the valley is characterized by pasture and farmfields on the north side of the highway and a mix of clearcuts and isolated mature/second growth forest on the south side of the highway. The Ashford area is characterized by broad openings of pasture and clearcuts on both sides of SR 706. Scattered deciduous and coniferous trees line the highway from the National area through the commercial area of Ashford. East of Kernahan Road, the valley floor is characterized by a thick mixed coniferous/deciduous forest, with pockets of mature/second growth forest south of SR 706, near Kernahan, and on both sides of the highway, east of Goat Creek.

The area contains a healthy mix of forest types and ages. Late-seral, or old-growth, coniferous forest occurs in the eastern end of the plan area, adjacent to Mount Rainier National Park. This type of forest is found primarily in the Glacier View Wilderness Area and in the Gifford Pinchot National Forest. The only old-growth forest identified in the valley floor exists south of SR 706, east of Kernahan Road, and between Goat Creek and the Park Entrance. Mid-seral, or mature/second growth, coniferous forest occurs throughout the plan area but dominates the foothills and mountain areas from north of and between Elbe and National. Smaller areas of mid-seral forest are located on the mountainsides from National to Kernahan Road. There are pockets of mid-seral forest also found throughout the valley floor. Early-seral, or young, coniferous forest is found primarily in combination with the mid-seral forest on hillsides and hilltops from Elbe to Ashford. Very little early-seral forest exists in the valley floor. Where it does occur, it is found in areas which have been clearcut.

In addition to the different seral stages of forest development outlined above, the plan area is also divided into different vegetative communities. The location of these different communities depends primarily on elevation. The western hemlock zone occupies the valley floor and lower hillsides, extending up to the 2,000 feet elevation level. The Pacific silver fir zone generally occupies hillsides at elevations of 2,000 to 4,250 feet in the plan area. The mountain hemlock zone is the highest forested zone and it is also the wettest and coolest. Elements of this zone can be found from 4,000 to 6,000 feet (timberline). Timberline is found about 5,100 feet. The alpine zone begins at timberline. Alpine vegetation communities are generally restricted to the higher mountains regions.

**Fish and Wildlife**

The community plan area is abundant with wildlife. The Nisqually River and associated wetlands, the land within the National Park and National Forests, and the numerous large tracts of vacant land all contribute to the rich diversity of wildlife found in the area. Forests provide habitat for birds and mammals. Forest canopies help shade streams and wetlands for a variety of fish species.

Riparian areas, such as those adjacent to the Nisqually River, provide essential corridors for wildlife movement. Riparian areas and wetlands provide nesting, migratory, and wintering areas for over 50 percent of the nation’s migratory bird species.

Vegetative cover plays a vital role in providing habitat for all species of wildlife. Forested areas within the plan area are utilized by wildlife for cover, foraging, and movement corridors. The
removal of forest cover from timber harvesting or land development activities can remove valuable habitat. Removal of forests near streams and wetlands can also impact water quality of surface waters upon which both fish and wildlife depend. Although limited removal of forested vegetation may improve habitat for some species (e.g., elk utilize open areas for grazing), the cumulative impacts of vegetation removal can be significant to wildlife. With losses in vegetation, most wildlife species have fewer places to use for food, water, cover, or nesting.

Many of the species found in the Upper Nisqually communities are large mammals such as cougar, bobcat, bear, elk, and deer. These animals need large home ranges and unrestricted movement corridors such as forest lands, open space, and parks. At this time, most of the Upper Nisqually is undeveloped and supports the habitat required for large mammal species.

### Species Found in the Community Plan Area

#### Fish

The Nisqually River is home to anadromous and resident fish populations. The river provides prime spawning habitat for anadromous steelhead, cutthroat trout, and four known species of salmon: Coho, pink, chum, Chinook, and possibly sockeye. All six species of salmonids are vital to the river’s ecology, but chum are perhaps the most important. The Nisqually Rivers’ annual chum migration is a unique late run which begins in December and continues into March. It is the single largest salmon run in the river. The wild (in contrast to hatchery raised) fish are the latest run of salmon in the State. There are no anadromous fish found above LaGrande and Alder dams.

No fish passage facilities are located at the dams. Table K-10 details the status, spawning habits, and origin of these anadromous species.

Information from 1992 Washington State Salmon & Steelhead Stock Inventory; WDOF, WDOW, Western Washington Treaty Indian Tribes

*All salmon and trout species found in the Nisqually are considered priority species by the Department of Fish and Wildlife.

The Nisqually River is also home to other species of fish such as kokanee salmon, rainbow and cutthroat trout. Information on resident fish species is limited. The small, self-sustaining population of kokanee are found above Alder dam. In the fall, the kokanee swim upstream to spawn in tributaries to the lake. The Nisqually River rainbow and cutthroat trout populations are also small, but are found in some of the tributary streams in the plan area. The May 1997
Draft Environmental Impact Statement contains detailed information on fish and wildlife species within the Upper Nisqually Valley.

**Wildlife**

The Upper Nisqually Valley is abundant with wildlife including large and small mammals, amphibians, reptiles, bird species, and invertebrates. Some species are declining in numbers and are protected through Federal or State laws. Federally endangered and threatened species that range within portions of the plan area are the gray wolf, spotted owl, grizzly bear, bald eagle, marbled murrelet, and the peregrine falcon.

The Washington State Department of Fish and Wildlife (WDFW) has established a Priority Habitats and Species Program which designates habitats and species as *priority* and represents a proactive measure to help prevent species from becoming threatened or endangered. The category of Priority Species includes all species that are presently State or Federal endangered, threatened, sensitive, or candidate. Priority Species also include species that the WDFW believes are vulnerable to future listing and species with recreational importance that are vulnerable to impacts because of lost or degraded habitat. The WDFW designates endangered and threatened species in Washington State pursuant to RCW 77.12.020. In addition, sensitive, monitor, and candidate species are recognized by the WDFW.

The Upper Nisqually Valley contains significant diversity of species. Most species utilize several different types of habitats throughout their life cycles and often use a different habitat for breeding, feeding, and cover. There are numerous habitat types found in the plan area including caves, cliffs, riparian areas, old-growth and mature forests, wetlands, snags, talus slopes, and meadows. Bald eagles, for example, utilize saltwater areas, lakes, and rivers particularly during feeding. Breeding territories are located in predominantly coniferous, uneven-aged stands with old-growth components usually with an unobstructed view of nearby water.

Table K-11 lists the Priority Wildlife Species that are likely to be found in or near the plan area. Certain species such as the grizzly bear and gray wolf may be only infrequent visitors to the plan area. Table K-12 lists the Priority bird species that are likely to be found in or near the plan area.

* Source: Washington Department of Fish and Wildlife

Many species found in the Upper Nisqually Valley are not on Federal or State listings. Coyote, red fox, mountain lion, bobcat, and black bear are common mammals that make the west side of the Cascades their home. River otter, muskrat, and beaver can be found along the Nisqually River and other animals such as shrews, voles, frogs, snakes, and birds can be found throughout the valley.

The Upper Nisqually Valley is home to elk species which are generally thought to be Rocky Mountain elk, but may also be a Roosevelt-Rocky Mountain cross. The elk are part of the valley pride of local residents. The winter range of elk often occurs at lower elevations along foothills, valley edges, and steep canyons, although actual use areas during a given year vary depending on the severity of weather, the accessibility of various vegetation types, and the amount of disturbance. Summer range consists of well-distributed, moderate-sized patches of forage openings and cover areas. If possible, elk will avoid sites with snow accumulation in excess of 46 cm. (18”). Elk can do well in the absence of traditional conifer cover as long as the elk are not disturbed. They are very sensitive to disturbance on open winter ranges. Elk calving habitat needs water within 300 m. (1,000’), occurs on terraces or slopes less than 15 percent, and is generally found on south or west slopes. Elk are particularly susceptible to human disturbance on calving grounds during the period from May 1 to June 30. Special features of elk habitat include travel corridors and wallows. These features are characterized by screening vegetation and lack of disturbance. Elk show reduced use of habitat areas adjacent to roadways. All human disturbance can impact survival and effective reproduction during crucial times of the year.
DESCRIPTION OF DESIRED CONDITIONS

EARTH RESOURCES

LANDSLIDE AND EROSION HAZARD AREAS

The valley contains slopes and hillsides that are susceptible to erosion and landslide hazards. Sluffing of slopes and erosion of hillsides is a concern to local residents because of the various impacts such as the loss of natural contours and topography, loss of stabilizing vegetation, increased site runoff, and increased sediment to streams and creeks. Erosion due to logging and development activities are of concern to the community. The desired condition is to minimize erosion and potential landslides and preserve the natural resources of the area. The policies of the community plan strive to ensure land use activities will not detrimentally impact hillsides and slopes. Development is to be located away from areas that might experience high erosion.

Design standards provide opportunities for development to work with the natural features and contours of a site as opposed to using large amounts of cut and fill. Finally, the plan actions include coordinating with the timber companies and forest agencies to work toward future consideration of developing viewshed guidelines that could help reduce erosion from logging activities as well as provide aesthetically pleasing views from the valley.

SEISMIC HAZARD AREAS

The valley does not contain a significant number of seismic hazard areas. Landslides and volcanic hazards are a greater potential threat to residents and visitors. The plan policies do not specifically address seismic hazards. The community wants to continue to follow County standards for seismic hazards.

VOLCANIC HAZARD AREAS

Due to its proximity to Mount Rainier, most of the valley is located within a volcanic hazard area. The community recognizes the greatest threat of volcanic activities occurs along the Nisqually River where debris flows, lahars, and jokulhlaups are likely to be more common. The desired condition is to protect property, residents, and visitors from the greatest threat by zoning Case II volcanic hazards areas Rural 40 which would allow one unit per 40 acres. All of the Case II volcanic hazard areas are located along the Nisqually River. The plan policies also address designing educational brochures and informational handouts to be distributed at kiosks and any visitor center, museum, or information center to inform visitors and residents about the risk of volcanic hazards. The community would also like to develop an evacuation plan for valley residents in the event of an emergency. Community plan policies call for the evacuation plan or emergency management plan to be in place by the year 2001.
**Water Resources**

Water resources are an important component of life in the Upper Nisqually Valley. The plan area contains the Nisqually River, Alder Lake, and numerous creeks and streams that feed into the Nisqually from adjacent hillsides. The Nisqually River and its tributaries are in good condition with extraordinary water quality and much vegetative cover intact. Flooding is a concern and a relatively frequent occurrence within the valley. There are a variety of wetlands and floodplains associated with the Nisqually River. The plan area appears to have abundant groundwater.

The policies in the plan describe the desired condition to be an ongoing maintenance of clean and abundant water resources. Development is to occur outside of floodplains, wetlands, streams, and creeks wherever possible. The community values the conservation of the natural resource over the potential economic benefit of development. The community also recognizes that building away from wetlands, streams, and particularly floodplains helps to ensure against loss of property as well. The plan policies also ask for further research into the current condition of water resources through the completion of a study to determine today’s baseline. This data can then be used to measure future impacts on the water resources and adjust community plan policies, zoning, or regulations where necessary.

**Vegetation**

The Upper Nisqually Valley is abundant with a variety of vegetation including old growth coniferous forest, mature/second growth coniferous forest, young coniferous forest, a mix of pasture, farmfields, clearcuts, meadows, and mixed deciduous/coniferous forest. The mix and abundance of natural vegetation contributes to the overall quality of life by contributing to diverse wildlife and excellent water quality in rivers and streams. Unlike urban areas of Puget Sound where the earth has been paved with development or other towns nestled in the Cascade foothills where mini-malls and parking lots have taken much of the natural vegetation and been replaced with manicured lawns, the Upper Nisqually Valley remains in a more wild, rustic state.

The maintenance and conservation of this environment is of upmost importance to the community. Policies in the community plan speak to the preservation of the natural vegetation and restrict the most intensive development to within four centers. All development is encouraged to retain as much natural site vegetation as possible. Design standards provide guidelines for integrating a development with the natural vegetative features of the site. If the natural features of the valley are denuded as development occurs, then much of the rural
character, privacy, and pristine surroundings that comprise that plan area will be considered lost.

**FISH AND WILDLIFE**

The Upper Nisqually Valley is abundant with fish and wildlife. The large tracts of land used for forestry, single-family, or left vacant contribute to a continuous habitat for species with a large home range. The National Park and Forest Service lands also provide a safe haven for many wildlife species. The people of the Upper Nisqually Valley choose to conserve and protect the local wildlife to maintain the health of the environment and preserve the enjoyment of the harmony of living with the wildlife for future generations.

The policies and practices in the community plan promote the management of forests and forest edges to provide habitat for wildlife. Policies within the Community and Cultural Element also ask for coordination between the local community, private timber companies, and public land managers to consider developing viewshed guidelines in the future. The viewshed guidelines could indirectly contribute to furthering wildlife conservation. The viewshed protection plan could indirectly contribute to furthering wildlife conservation. Natural Environment policies address waste disposal practices and problems that are harmful to fish. Upgrading failing septic systems and proper maintenance of septic systems are addressed through educational measures. Pesticides are a concern to local citizens and plan policies address reducing the use of unsafe pesticides that can harm human health and wildlife. This reduction is intended to be accomplished through educational measures. Finally the plan asks for further research into the current condition of wildlife habitat and inventory through the completion of a study to determine today’s baseline.

This data can then be used to measure future impacts on the fish and wildlife and adjust community plan policies, zoning, or regulations where necessary.

**ENVIRONMENT POLICIES**

**GOALS**

We envision a valley where healthy habitats exist for humans and wildlife; where clean air and unpolluted water resources are enhanced through responsible management of our natural resources.

**CRITICAL AREAS AND NATURAL RESOURCES**

The intent of the critical areas and natural resources policies is to recognize that current County regulations sufficiently protect critical areas and to emphasize the importance of conservation of unprotected resources such as vegetation.

**GOAL UNV ENV-1** Recognize that the community prefers to preserve the environment in its natural state to the greatest extent possible.
UNV ENV-1.1 Development proposals which have significant adverse impacts to critical areas that cannot be mitigated to less than significant levels shall be denied.

UNV ENV-1.2 Manage forests and forest edges realizing that they provide habitat for wildlife.

UNV ENV-1.3 Recognize that recent changes in forest practices help retain forest resources.

UNV ENV-1.4 Direct growth and commercial activities into planned community centers to reduce sprawl and preserve the natural environment and rural character.

UNV ENV-1.5 Protect the elk herds and habitat that are part of the important wildlife resources of the Upper Nisqually.

UNV ENV-1.6 Landowners are encouraged to retain a contiguous area of open space when developing and subdividing properties in the Rural 10 or Rural 40 lands for the purposes of providing elk corridors from the forest lands to the Nisqually River.

GOAL UNV ENV-2 Improve the information currently available on the quality and state of the natural resources, critical areas, and environmentally sensitive lands in the valley.

UNV ENV-2.1 Support the completion of baseline information and inventories about valley resources for the purposes of monitoring, scientific research, and enhancement.

UNV ENV-2.2 Investigate a partnership to complete the water resources study and the fish and wildlife resources study by contacting possible cooperative agencies such as the Nisqually and Puyallup tribes, Trout Unlimited, US Forest Service, State department of Natural Resources (DNR), National Park Service, private timber companies, local businesses, and other environmental interest groups.

PESTICIDES

The intent of the pesticides policies is to recognize that pesticide use can be detrimental to the health of the community and resources, and to educate businesses and landowners to best management practices for safe pesticide use.

GOAL UNV ENV-3 Protect the health of humans and the environment by minimizing the use of pesticides.

UNV ENV-3.1 Reduce the use of pesticides and herbicides in the valley and recognize they may damage the health of humans and wildlife, impact water resources, and destroy native vegetation.

UNV ENV-3.2 The use of pesticides within critical areas and their buffers shall not be allowed except under extreme circumstances.

UNV ENV-3.3 Initiate a dialogue with the Washington State Department of Transportation, U.S. Forest Service, DNR, Pierce County, City of Tacoma, and private timber companies to discuss the reduction of pesticide use for the general management of their resources.
IMPLEMENTING ACTIONS

The following is a list of actions that should be completed in order to implement the policies contained within this plan. They are arranged according to the timeframe within which each should be completed; short, medium, or long term. Short term actions should occur immediately or within one year of plan adoption. Mid-term actions should be completed within 2-5 years. Long term actions should be completed within 5-20 years of plan adoption. The party or parties responsible for leading the effort to complete the action item is listed in parenthesis following the action. Actions are assigned to the Gateway Community Advisory Board (GCAB), the Upper Nisqually Advisory Commission (UNAC), or Pierce County Planning and Land Services (PALS). Those actions assigned to the GCAB are completed as part of the adoption and implementation of this plan.

SHORT TERM ACTIONS

1. Amend the County’s official mine hazard map in the Ashford area to more accurately reflect the area of potential danger. (PALS)
2. Develop a procedure in which a property owner may use the Draft Supplement EIS for the Upper Nisqually Valley Community Plan (December, 1998) to minimize environmental review for a development within the commercial centers. (PALS)
3. Request local timber companies to have public meetings with the community when applying to the state or county for a timber cut within the plan area. (UNAC)
4. Designate and zone portions of the valley to allow for a variety of transportation modes and facilities. (GCAB, UNAC)
5. Designate and zone portions of the valley to allow for a variety of transportation modes and facilities. (GCAB, UNAC)
6. Work with the Nisqually Indian Tribe and the Department of Fish and Wildlife to establish Elk Management Corridors and migration routes which will link the forest lands to the Nisqually River. Specific geographic areas of concern include, but are not limited to, Section 25, R5E and the East ½ of Section 30, R6E and Section 30 of R7E. (UNAC)

MID-TERM ACTIONS

1. Work with the Washington State Department of Transportation to stop or reduce pesticide use along roadways. (UNAC)
2. Encourage the City of Tacoma to investigate cutting vegetation instead of pesticide spraying along the train right-of-way. (UNAC)
3. Investigate funding opportunities to assist homeowners in the upgrading of older or inefficient woodstoves. (UNAC)
4. Develop criteria to determine which residents qualify for assistance in replacing older stoves. (UNAC)
5. Publicly support development proposals which do not impact critical areas. (UNAC)
6. Develop a process to encourage developments which are integrated with the natural resources of the site and avoid critical areas. The process could include:
   - Bypassing UNAC approval;
   - Scheduling special or emergency UNAC meetings to facilitate process;
   - Demonstrating support for the project before the Hearing Examiner; or
   - Using the Supplemental Environmental Impact Statement for threshold determinations where possible. (PALS, UNAC)

7. Work with the U.S. Forest Service, DNR, National Park, private timber companies, and Pierce County to develop a public education program about sustainable management of natural resources including forest and agricultural lands. (UNAC)

8. Work with the public agencies to ensure enforcement of all provisions and mitigation measures of forest practice permitting. (UNAC)

9. Support land exchange proposals between private and government agencies which help preserve resource lands in the Upper Nisqually Valley. (UNAC)

10. Enter into a partnership with private organizations, public organizations, or local tribes to initiate a study and inventory of all water resources including streams, wetlands, groundwater, flooding areas, and water quality. (UNAC)

11. Enter into a partnership with private organizations, public organizations, or local tribes to initiate a study and inventory of wildlife resources which includes species, habitat location, and condition. (UNAC)

12. Investigate the possibility of allowing various school districts (elementary, secondary, or college) to use the Upper Nisqually Valley as a field laboratory for natural science classes or projects. (UNAC)

13. Establish an outreach program to educate landowners and correct failing septic and woodburning systems. (Pierce County, UNAC)

14. Work with the existing homeowner associations and property managers in educating absentee homeowners about the importance of maintaining septic tanks. (Pierce County, UNAC)

15. Develop a brochure which discusses the installation, maintenance, and operations of septic tanks and mail them to property owners. (Pierce County, UNAC)

16. Develop strategies to assist property owners in replacing or correcting failing systems. (Pierce County, UNAC)

17. Actively pursue correction of any septic tanks that are adversely impacting water resources. (Pierce County, UNAC)

18. Find a method of guaranteeing State Revolving Loans to ensure monies are available to those in need of septic corrections. (UNAC, Pierce County)

19. Review State grant opportunities and apply for funds if applicable. (UNAC, Pierce County)

20. Research non-profit organizations which may provide funding for environmental improvement projects. (UNAC)

21. Contact City, State, and Federal representatives to stop the dumping of sewage on the tracks and request holding tanks be placed on all trains passing through the valley. (UNAC)
22. Work with the National Park to develop transportation alternatives for Park visitors that shuttle groups from the Village Centers to the Park. (UNAC)
23. Develop educational materials for distribution at kiosks, local businesses, and schools about air resources and actions to improve air quality. (UNAC)

**LONG TERM ACTIONS**

1. Research and identify alternatives to the use of pesticides and share the information with residents, U.S. Forest Service, DNR, and private timber companies. (UNAC)
2. Investigate the type and extent of spraying occurring on forest service lands and work with private timber companies and the Forest Service to find natural alternatives to pesticide spraying. (U.S. Forest Service, UNAC)
3. Review proposed changes to the current Critical Area Regulations and provide comments to the County through the adoption/review process. (UNAC)
4. As new information is obtained, UNAC may propose or recommend regulations to the County Council to protect resources in the Upper Nisqually Valley after formal public comment and review. (UNAC)
5. Develop a rideshare program. (UNAC, Pierce County, Pierce Transit)
6. Based upon research and data resulting from the studies, increase public education or recommend regulatory changes to protect water and wildlife resources. (UNAC)
7. Review the completed studies and incorporate appropriate recommendations into community plan policies and regulations. (UNAC, PALS)
8. Establish a monitoring program to measure the impacts of development with established baseline data to determine whether community plan policies and regulations are effective. (UNAC, PALS)
9. Work with the State, County, National Park Service, and Puget Sound Air Pollution Control Agency to establish baseline air quality standards that can be monitored. (UNAC)
10. Incorporate air quality education in the public outreach forums conducted through campground programs. (UNAC, National Park)
Water Resources

- Wetland
- Watershed Boundary
- Water Course

The boundaries of wetlands are approximate and are intended only to provide an indication of the presence of wetland areas. Additional wetlands that have not been mapped may be present.

Upper Nisqually Valley Community Plan

Pierce County, Washington

Department of Planning and Land Services
Plot Date: November 26, 2007

Water Resources
Chapter 5: Economic Element

INTRODUCTION

While the Upper Nisqually Valley is abundant with natural resources and wildlife, it is scarce on jobs and economic opportunities for local residents. Balancing economic development and quality of life are key concerns in nearly every small town. Rural towns across the State have struggled with economic decline as their traditional resource-based industries of forestry, mining, and agriculture have declined. The Upper Nisqually Valley has been slow to diversify away from an economy dependent upon the forest industry which declined significantly in the 1940's and 1950's.

However, the slow growth has helped maintain some of the community's greatest assets--the pristine river valley, forest lands, steep slopes, abundant wildlife, and large tracts of open space. The community plan strives to conserve the natural environment while improving economic opportunities for local citizens by directing business and employment opportunities into three small community centers and diversifying the economy.

The residents of the Upper Nisqually Valley would like to diversify the economy and provide year-round family wage jobs to local residents. The community would like to make economic improvements that build upon the unique talents and historic strengths of local residents.

Enhancing the tourism industry, marketing mountaineering opportunities, capitalizing on changes in the forest products industry, and encouraging environmentally-appropriate natural resource manufacturing and businesses are key steps to achieving the community vision. The Land Use Element supports the Economic Element by directing growth into three centers (see Map K-1: Land Use Designations): two Village Centers which serve as the main focal points of the valley; and one center oriented toward serving tourists. All three centers in the plan area are targeted for development of commercial and, where appropriate, light manufacturing business.

Local ownership is another important component of the community plan. Many of the successful businesses in the valley are presently owned by local citizens and families. Cottage industries, home occupations, and bed and breakfast facilities are common throughout the valley. The community would like to see this trend continue as it provides a sense of cohesiveness among residents while promoting individualism and uniqueness. Design standards accompany the plan and do not allow corporate or franchise styles to be constructed.
The Economic Element emphasizes the community’s vision by setting forth the community’s goals and objectives related to economic development. The element is divided into three parts: the first part briefly describes the existing economic conditions in the valley; the second part describes the economic conditions desired by the community; and the third part sets forth the actions to be taken to achieve the community’s vision. In addition, a technical appendix to this plan provides a detailed economic analysis of the valley and a feasibility analysis of the action items.

**DESCRIPTION OF CURRENT CONDITIONS**

As with many small communities in the West, residents of the Upper Nisqually Valley are attempting to navigate the currents of change as they move from dependence on natural resource extraction to a more diverse economic base. The communities in the valley got their start as timber towns, helping to supply the raw materials for development of the western frontier.

During the second half of the twentieth century, the dominance of forestry in the local economy has declined, and there has been no organized effort to fill the void left by the changing timber industry. The changing economy has culminated in higher unemployment and lower business and personal income than in other parts of Pierce County and Washington State as a whole. In 1997, Chase Economics was retained to complete an economic analysis of the Upper Nisqually community. Chase Economics completed a series of reports which are included with the source documents for this community plan.

**LABOR MARKET AND EMPLOYMENT**

Based on the 1990 census, the 1996 labor force residing in the Upper Nisqually Valley is estimated at 511 persons. The employed workforce residing within the area is estimated at 463 persons, implying an annual average unemployment rate of 9.1 percent. In comparison, Pierce County’s 1996 unemployment rate was 6.2 percent. In addition, a large percentage (43.6 percent) of the employed residents commuted 30 minutes or more to work sites outside of the area. Although this high rate of commuting leads to the characterization that the Upper Nisqually is a bedroom community, these jobs bring in outside earnings (e.g., wages, salaries, and proprietors’ incomes) to the area. A sizable portion of the labor force is employed outside of the area or is unemployed. This large percentage implies that there is an overall lack of job opportunities within the local area.

Employment within the Upper Nisqually Valley is largely oriented toward service sector jobs such as government, wholesale and retail trade (e.g., eating and drinking establishments, souvenir shops, art dealers), and personal services (e.g., motels and lodges, tourist cabins). In 1990, the ratio of service-producing jobs to goods-producing jobs for the valley was 7.76, meaning for every one goods-producing job in the area, there were nearly eight service-producing jobs. The statewide ratio in 1990 was 3.43 which shows proportionately far more people working in the service industry in the Upper Nisqually Valley than statewide.
Table K-13 provides an illustration of employment and earnings in the valley. In 1996, average earnings for all jobs in the Upper Nisqually Valley was $21,379. In comparison, the 1996 average earnings per job in Washington State and Pierce County was $30,476 and $29,975 respectively.

Area workers employed by the Federal government garner the highest annual earnings followed by manufacturing (logging) and State and local government. The lowest annual earnings in the area were found in agriculture, trade, and services. For the latter two sectors, the reason for the low average earnings are due to the pronounced seasonality of employment in the valley.

While tourism-related services currently provide the majority of private-sector jobs and income in the Upper Nisqually, Federal, State and local governments account for more than half of all jobs and nearly seventy percent of wages generated within the valley. The majority of government jobs are found in the administrative headquarters for Mount Rainier National Park. The U.S. Forest Service and the Washington Department of Natural Resources also employ Valley residents.

</table>

Notes: Earnings include both wages & salaries and proprietor income; total employment include both full and part-time wage & salaried workers and self-employed. Earnings and employment is by place of work, i.e., employment and earnings associated with establishments located within the Upper Nisqually Valley. Sources: U.S. Bureau of Economic Analysis, Washington Employment Security Dept., Chase Economics.
**PERSONAL INCOME**

Per capita personal income for Valley residents in 1996 was approximately $14,773. In comparison, Pierce County per capita income for the same year was $21,728, a difference of 47 percent. Per capita income figures indicate that Upper Nisqually households and families are less affluent compared with the State and Pierce County. Not surprisingly, the Chase Economic Analysis showed the number of residents living in poverty is substantially above that of the State and Pierce County. Personal income consists of three major components, identified by earnings, property incomes, and transfer payments. Earnings accounted for 77.6 percent of the area’s total personal income in 1996. Labor earnings accounts for a far greater share (77.6 percent) to the Valley’s total income compared with Pierce County (67.8 percent) and the State (66.5 percent). Income from self-employment represent a greater share in the Valley’s total (8.3 percent) than in Pierce County (6.6 percent). The remaining 22.4 percent of personal income is split between dividends, interest, rent, and transfer payments. (Transfer payments are from the government to people for reasons other than payment of labor services.) The proportion of transfer payments related to retirement is smaller when compared to the rest of Pierce County and Washington State. Consistent with the relatively lower per capita income figures and smaller percentage of retirement-related transfer payments, there is also a higher incidence of poverty in the plan area and a greater proportion of households receiving some form of public assistance than in either the County or State taken as a whole.

**BUSINESS INCOME**

After rising steadily in the late 1980's and early ‘90's, gross business income for firms operating in the valley began to fall in the mid ‘90's. In addition, taxable retail sales for valley businesses increased an average of only .23 percent, after adjusting for inflation, from 1987 through 1997, and actually finished the period 3.84 percent lower than they started. That decline occurred at a time when retail sales for all of Pierce County increased by 29 percent, and 33 percent for all of Washington State. Several factors contribute to the business income trends including: seasonal weather patterns affecting visitation to Mount Rainier; road closures and construction projects, again affecting visitation to the Park; and the tendency of many local residents, especially those who commute to work, to travel to larger communities for shopping. Given that much of the local economy now relies upon tourist-related expenditures, this is an issue facing the Upper Nisqually business community. In addition to capturing tourism dollars, valley merchants must contend with the increased tendency of local residents to travel to nearby larger communities for shopping.

**MOUNT RAINIER NATIONAL PARK**

The grandeur of Mount Rainier is the symbol of the Cascade Mountains that is most familiar to Americans. It is located within 75 miles of major urban centers on both the east and west sides of the Cascades. Over three million people live within one hundred miles of the Park. On the basis of proximity, a significant share (44 percent) of Mount Rainier visitors come from these
urban centers. In addition to the pristine areas contained in the Park, numerous recreational opportunities abound. Mountain and rock climbing, snowshoeing, cross-country skiing, hiking, and camping are just a few of the recreational activities available in the Park.

**Visitor Estimates**

The National Park Service has the responsibility to manage Federal parks in a manner which minimizes the environmental impacts of visitors on the Park's natural environments, while still providing various recreational opportunities for the public. The National Park Service estimates 2,181,396 people visited Mount Rainier National Park in 1995. This estimate reflects an annual visitor increase of 1.8 percent since 1975. Although the annual visitation rate has increased over the past twenty years, the number of visitors to Mount Rainier has fluctuated, in some instances dramatically from year to year. Fluctuations in annual attendance are the result of a number of factors including weather, flooding damage, road closures, road construction, avalanche hazard, fuel prices, local and national economies, and government shut downs.

Until the 1990's it was very rare for the Park to attract more than 2,000,000 visitors. However, between 1989 and 1995, visitation exceeded two million persons in six of the seven years. The National Park Service estimates 245,333 vehicles entered Mount Rainier National Park through the Nisqually entrance in 1995. This estimate reflects an annual visitor increase of 1.3 percent since 1988. This annual rate is slightly lower than experienced during the same time for the entire Park, a 2.4 percent annual increase.

The economy of the Upper Nisqually Valley is largely influenced by Mount Rainier National Park. Fluctuations in the local economy may occur due to weather conditions, road closures, or other factors that influence visitation to the Park.

The average summer visitation (June through September) to Mount Rainier National Park accounts for 70 percent of the yearly total. The peak month of visitation is in August, consisting of 24 percent of the yearly total. January and December are the months experiencing the lowest visitation, two percent each month, during the year.

**The Vail Agenda**

In 1991, the National Park Service celebrated its 75th anniversary. While most organizations focus on past achievements during their anniversary year, the National Park Service concentrated on improving its organization and management of its resources. The Park Service, in cooperation with institutions concerned about the management of the national park system, initiated an intensive review of its responsibilities. This effort was coordinated by a steering committee with working groups discussing specific problems and challenges.

In October 1991 at the 75th Anniversary Symposium, "Our National Parks: Challenges and Strategies for the 21st Century," held in Vail, Colorado, the working groups presented a draft report to nearly 700 experts and interested parties from inside and outside the Park Service. The draft report facilitated debate and discussion regarding the future of the national park system. The outcome of this event was a report which clarified the evolving role of the National Park Service and identified strategic objectives and specific recommendations for the
organization for the 21st century. This report was published in 1992, titled, "National Parks for the 21st Century; The Vail Agenda, Report and Recommendations to the Director of the National Park Service."

The report contains a variety of recommendations related to gateway communities. Among the recommendations that impact the Upper Nisqually Valley are limiting the number and type of facilities within national park boundaries, improving transportation systems, and translating the importance of the park through coordination and planning with agencies responsible for management of lands outside the national park boundaries.

Throughout the evolution of the national park system, facilities have been constructed within park boundaries which are for the convenience of visitors and not necessarily needed to enjoy the park's resources. Examples of such facilities are gas stations and grocery stores. The Vail Agenda calls for these facilities to be provided outside park boundaries by the private sector within surrounding gateway communities. The outcome of implementing these recommendations would be a greater demand for visitor facilities and services in the communities surrounding park entrances. For the Upper Nisqually Valley, this demand would be focused on the commercial areas providing tourist services such as the communities of Ashford and Elbe.

The National Park Service also wants to encourage improved public transportation systems. Improved transportation systems would help protect natural resources and enhance the visitor experience. The Park Service would like to coordinate in-park transportation systems with public transportation systems and design innovative transportation alternatives. The result of these recommendations could be a better transportation system to the National Park through the Upper Nisqually Valley. Additional public transportation facilities, such as shuttle systems, could be located in one or more of the centers. Although the improved transportation system is intended to accommodate visitors to Mount Rainier National Park, local residents, rail for light industry, and employees of the National Park could also benefit.

In past years, managers in the National Park Service have focused their attention on the activities within the Park Service’s boundaries. This was in part due to the fact that much of the land surrounding the parks was undeveloped. In recent years, as development began to occur outside national park boundaries, park managers have observed adverse impacts to park resources. These impacts may affect components of the environment ranging from air and water quality to cultural landscapes. Participants in the Symposium believed the Park Service must work closer with the communities outside their boundaries. As a result, various recommendations contained in the Vail Agenda address how park managers can deal with their neighbors and their activities. The result of these recommendations should be a greater presence of National Park Service representatives in surrounding communities. Both the National Park Service and the residents should have a better understanding of issues and limitations. Working closer with the surrounding communities should also bridge communication better than what has been experienced in previous years.
**Gifford Pinchot National Forest**

The U.S. Forest Service is responsible for the lands within the Gifford Pinchot National Forest. The Forest Service is responsible for managing the forest for long-term timber production while providing recreational and natural opportunities for public enjoyment. The forest is managed through the Land and Resource Management Plan of 1990, as amended, which addresses timber harvest and recreational activities.

Many of the lands suitable for timber production in the Forest have been extensively harvested in the past. The forest plan identifies 2,284 acres of the Pierce County portion of the Forest as being suitable for timber production.

Although estimates for existing recreational usage are not available, day visitors are taking advantage of the roads and trails for hiking and biking. All Forest Service roads are designated as secondary forest routes. Various trailheads are located off the main route accessing the forest from the Nisqually Valley floor, Forest Road 59. The trails within the National Forest lie mostly within the Glacier View Wilderness Area.

**Elbe Hills State Forest**

The Washington Department of Natural Resources (DNR) manages approximately 23,000 acres of land as the Elbe Hills State Forest. Approximately 20,774 acres of the Forest lies within the Plan Area. The Elbe Hills State Forest is part of an original 1889 land grant from the federal government.

**Forest Condition/Character**

An inventory of the age of timber stands in the Elbe Hills State Forest was issued in July 1990 as part of a draft Nisqually Resource Management Plan prepared by the DNR. The management plan was never finalized. The 1990 inventory identified, northeast of Elbe, scattered stands of less than 1,800 acres in overall area with an origin in the 1920's or earlier. The 1990 inventory identified that the overwhelming majority of timber has origins in the 1930's and 1940's. In addition, the inventory identified scattered stands with origins in the 1950's, 1960's, 1970's, and 1980's.

**Recreation Use**

In addition to its role as a timber producer, the Elbe Hills State Forest plays a significant role in providing recreation opportunities. The forest contains two large trail systems for different types of recreation users. The Elbe Hills Off-Road Vehicle (ORV) Trail System located off 9 Road, west of Busywild Creek, is used by mountain bike, motorcycle, and four-wheel drive vehicle enthusiasts. The Sahara Creek/Nicholson Horse Trail System located on the hillsides and ridges above the Nisqually River Valley between Elbe and Ashford is used by horseback and hiking enthusiasts. In addition to the designated trail systems, there are numerous roads open to the public for exploration of the forest.
DESCRIPTION OF DESIRED CONDITIONS

Residents of the Upper Nisqually Valley would like to improve the economy and job opportunities available closer to home through tourism, commercial business and light industry. However, there is a certain reluctance in the community to accept growth and change. There is an underlying, and quite valid fear of losing some of the qualities that make life in the Upper Nisqually unique. All of the elements of the community plan work together to try to balance these sometimes opposing goals of improving the economy while retaining a rural character and pristine natural resources. Growth is directed into three designated centers and is not allowed to spread haphazardly throughout the valley. These centers are targeted for development of commercial business. The rest of the valley is zoned into large tracts of land in order to continue the rural landscape. Within the centers, shopping and service opportunities would be provided not only for tourists, but local citizens as well, thus reducing the need for local residents to travel to larger communities outside of the valley to do their everyday shopping.

The economic strategies build upon the traditional strengths and talents of the local community by: encouraging local ownership, encouraging home occupations and cottage industries, growing the tourism, mountaineering, and natural resources sectors of the economy.

TOURISM

Residents of the Upper Nisqually Valley would like to change the seasonal nature of their economy by strengthening and lengthening the tourist season to better capture the dollars otherwise bypassing the communities. Residents would like to see the early spring and late fall become important times in the tourist trade, allowing local business owners to realize profits through more of the year. The plan policies contain a myriad of strategies to achieve the desired condition of improving and lengthening the tourist season. These strategies focus on building upon the outdoor recreational opportunities, artistic skills of local residents, history of the region, and natural resources of the valley. Expanding upon these opportunities will be accomplished through improved marketing (regionally and nationally), zoning areas for opportunities to occur (such as allowing for rental of recreational equipment or micro-breweries within centers), building infrastructure (such as connections between the valley and mountain biking opportunities or a museum for historical information), organizing annual events (such as an arts festival), and coordinating the local business community with other regional and national networks (coordination with the Park Service, Visitor Convention Bureau, etc.).

NATIONAL HARBOUR PLYWOOD CORP. CIRCA 1930s

The tourist season may extend into the fall, winter, and spring seasons if marketing of existing amenities is properly expanded. The valley has ample access to winter sports and recreational opportunities such as cross-country skiing, snowshoeing, and snowmobiling. Further, there are
ample opportunities for relaxing in the fresh mountain rain at one of the many bed and breakfast facilities with jacuzzi or spa facilities.

**Mountaineering**

The Upper Nisqually Valley is in a prime location for those interested in learning or furthering their mountaineering skills. The proximity to Mt. Rainier, the Cascade Range, Mt. Adams, Mt. St. Helens, and the Olympic Range allows numerous opportunities for mountaineering challenges. The desired condition is to build upon this opportunity by promoting mountaineering opportunities, advertising the local guide schools, and coordinating with the National Park to offer more mountaineering experiences. The area’s heritage and local expertise in mountaineering can be developed as a significant portion of the local economy, as well as provide a unifying theme for economic development efforts. Plan policies also promote and encourage the manufacturing of mountaineering equipment, outdoor clothing, or other spin-off industries.

**Forestry**

The desired condition is to maximize timber dollars with sustainable forestry and to diversify forestry employment from the cutting of raw timber to promoting other forest-related activities. Plan policies allow for the continuation of timber harvesting but, recognize that diversification of the forest industry is likely to have stable long-term economic results. The community plan promotes offering the valley for ecosystem, wildlife, and forest research to universities, scientists, and Washington State. Federal, State, and private timber companies are also encouraged to provide management or administrative offices within the community. Finally, forest-related industries such as cabinet-making, log cabins, or other hand-crafted wood products are encouraged and should be actively marketed. Adding value to local timber products and developing the specialty forest products industry would allow valley residents to enter increasingly profitable niche markets.

**The National Park and Other Public Lands**

A sustainable economy and community development will best be achieved through improved coordination and cooperation with the public agencies and private interests that control large land holdings in the valley and influence the tourist industry. Cooperation and coordination should also occur between communities that are located at the base of Mount Rainier. The
desired condition is to develop a working partnership between the community, other public agencies, and private timber companies. An improved relationship will result in better information and resource sharing to further the interests of the local community and the public land administrators. For example, information such as visitor data and traffic counts should be shared to allow local businesses and residents to better plan and provide for the needs of visitors. Easily accessed up-to-the-hour information regarding Park closures and road conditions should also be disseminated throughout the community. Furthermore, the public land administration and private timber companies have resources that can benefit the community. These resources can include knowledge, skills, and monies.

The community also needs to begin to take a more active role in participating in and influencing the decisions regarding the public lands. Public land representatives and local citizens need to interact and discuss proposed changes in the management of the public lands that affect the community. The community also needs to be clear about stating its position and goals. If the community wants the Park Service to consider constructing an information center in the valley, it needs to be clearly stated. Finally, the local citizens should strive to improve the relationship with the Park Service by providing support for the public lands through such activities as volunteering.

**ECONOMIC DEVELOPMENT POLICIES**

**GOALS**

We envision a healthy economy that recognizes our unique talents and builds on our historic strengths. We envision a valley economy that is based on environmentally sound businesses and industry which provides year-round family wage jobs while encouraging local ownership.

**TOURISM, MOUNTAINEERING, AND FORESTRY/NATURAL RESOURCES**

The intent of the tourism, mountaineering, and forestry policies is to improve and diversify the economy through a myriad of strategies which build upon the outdoor recreational opportunities, artistic skills of local residents, history of the region, and natural resources of the valley.

**GOAL UNV EC-1**

Strengthen the economy by building upon the traditional strengths of the valley in tourism, mountaineering, and forestry.

**UNV EC-1.1**

Strengthen and extend the tourist season into spring, winter, and fall by capitalizing on outdoor recreational, artistic, heritage, ecotourism, and natural opportunities of the valley.

**UNV EC-1.1.1**

Improve the local economy by marketing interpretive tourist opportunities in the valley.

**UNV EC-1.1.2**

Promote arts-related business and activity.
UNV EC-1.1.3 Coordinate an organized network of local artists that can support and market the wares of the artistic community.

UNV EC-1.1.4 Market the recreation opportunities in the valley such as snowmobiling, mountain biking, cross-country skiing, hiking, and fishing.

UNV EC-1.1.5 Display the historic and cultural heritage of the community.

UNV EC-1.1.6 Encourage visitors to Mount Rainier to stop at local retail and service establishments in the valley by designing pedestrian-oriented centers that entice people to stop.

UNV EC-1.1.7 Encourage ecotourism through tours of the national forests, national park, Nisqually River, and natural resource amenities in the valley.

UNV EC-1.1.8 Encourage a diversified tourist economy with small-scale industries such as wineries, breweries, natural resource manufacturing with interpretive experiences, or manufacturing of outdoor mountaineering gear.

UNV EC-1.1.9 Work closely with the Tacoma-Pierce County Visitor & Convention Bureau and the Washington State Division of Tourism to coordinate, publish, and distribute information.

UNV EC-1.1.10 Allow the use of wineries and breweries within centers.

UNV EC-1.1.11 Develop an annual festival in the valley that could consist of a sport competition, or local Washington products, or theater plays.

UNV EC-1.1.12 Target each of the Rural Gateway Communities for development of commercial business to serve visitors.

UNV EC-1.2 Work with public and private agencies to market the wares of local artists.

UNV EC-1.2.1 Allow for a centralized retail sales location for local arts (possible business incubator) within Village Centers.

UNV EC-1.3 Work with public land representatives to market the recreation opportunities, particularly for winter activities such as snowmobiling, mountain biking, and cross-country skiing.

UNV EC-1.3.1 Allow for sporting goods stores and sales/rental of outdoor gear within centers.

UNV EC-1.3.2 Encourage local businesses to coordinate and design package deals for lodging/recreation activities.

UNV EC-1.3.3 Allow for U-Cut Christmas tree farms throughout the rural lands in the Upper Nisqually.

UNV EC-1.4 Promote the Upper Nisqually Valley as a premier destination for mountaineering.

UNV EC-1.4.1 Recognize that Mount Rainier provides an ideal location for developing and promoting mountaineering guide schools.
UNV EC-1.4.2 Promote year-round mountaineering opportunities, including diversification of permitted outfitted guide services.

UNV EC-1.4.3 Work closely with the national park to open guide service opportunities to more than one provider a year.

UNV EC-1.4.4 Promote interpretation and education of Rainier mountaineering.

UNV EC-1.4.5 Encourage manufacturing of associated mountaineering equipment.

UNV EC-1.4.6 Maximize timber dollars with sustainable forestry and diversify forestry employment from the cutting of raw timber to promoting other forest-related activities.

UNV EC-1.4.7 Support and promote opportunities to make the valley a place where forest research can occur.

UNV EC-1.4.8 Encourage federal, state, and private timber companies to provide offices within the community so foresters and their management can be located in the valley.

UNV EC-1.4.9 Support the wholesale and retail sale of forest products.

UNV EC-1.4.10 Encourage the DNR, U.S. Forest Service, and private timber companies to contract with valley operators when harvesting timber in the valley.

UNV EC-1.4.11 Promote forest industry employment by encouraging active management of sustainable forest lands.

INDUSTRY

The intent of the industry policies is to diversify the economy and provide year-round family wage job opportunities for local citizens.

GOAL UNV EC-2 Change the seasonal nature of the economy and provide year-round jobs to local residents.

UNV EC-2.1 Encourage diversification of the local economy and improve the existing transportation infrastructure.

UNV EC-2.2 Encourage environmentally-friendly resource manufacturing businesses that have little or no impact on the environment.

UNV EC-2.3 Environmentally friendly cottage industries and home occupations are strongly encouraged as a means of employment throughout the valley.

UNV EC-2.4 Diversify the economy through ecotourism opportunities unique to the Upper Nisqually Valley.
COORDINATION

The intent of the coordination policies is to improve the relationship of the local community with public land managers and agencies which have a role in the Upper Nisqually Valley.

GOAL UNV EC-3

Develop the relationships with the National Park Service; U.S. Forest Service, Department of Natural Resources; Department of Transportation; Department of Community, Trade, and Economic Development; Tacoma Regional Convention + Visitor Bureau; private timber companies; and the community to promote the economic vitality and environmental preservation of the community.

UNV EC-3.1 Create a working partnership with public land representatives, private timber companies, and the community.

UNV EC-3.2 Foster a relationship between the National Park Service and the community that strengthens and encourages communication and cooperation.

UNV EC-3.3 Strengthen coordination of the local business community with the National Park Service, U.S. Forest Service, and Department of Natural Resources.

UNV EC-3.4 Develop partnerships with the National Park Service, U.S. Forest Service, Department of Natural Resources, and private timber companies to fund improvements within the communities or place seed money into the community and lend technical assistance.

UNV EC-3.5 Encourage business operators and residents of the Upper Nisqually Valley to take a more active role in participating in and influencing decisions made by the National Park Service, U.S. Forest Service, State Department of Natural Resources (DNR), and timber companies.

UNV EC-3.6 Encourage the DNR to develop a fee-based recreation program for forest recreation activities such as tours, guided activities, trail uses, etc.

UNV EC-3.7 Encourage the Mount Rainier concessionaires to move some or all facilities into designated centers.

IMPLEMENTING ACTIONS

The following is a list of actions that should be completed in order to implement the policies contained within this plan. They are arranged according to the timeframe within which each should be completed; short, medium, or long term. Short term actions should occur immediately or within one year of plan adoption. Mid-term actions should be completed within 2-5 years. Long term actions should be completed within 5-20 years of plan adoption. The party or parties responsible for leading the effort to complete the action item is listed in parenthesis following the action. Actions are assigned to the Gateway Community Advisory Board (GCAB), the Upper Nisqually Advisory Commission (UNAC), the Washington Department of Natural Resources (DNR), the U.S. Forest Service (USFS), Mount Rainier National Park, or Pierce County Planning and Land Services (PALS). The local business association is also listed as they are
recognized as a major influence within the Upper Nisqually Valley. Those actions assigned to the GCAB are completed as part of the adoption and implementation of this plan.

**SHORT TERM ACTIONS**

1. Establish a subcommittee of the UNAC to work with the National Park Service, U.S. Forest Service, Department of Natural Resource, Department of Transportation, Department of Community, Trade, and Economic Development, Visitor Convention Bureau and private timber companies.
2. The subcommittee should set a schedule for discussing:
   - Specific actions the community can participate in to aid the public lands; and
   - Specific actions on behalf of the public lands and large timber companies that will market the recreation or environmental aspects.
3. The subcommittee should set a method for communicating and coordinating with the UNAC, business association, and the community so that all can be involved. (UNAC)
4. Advertise valley opportunities by:
   - Developing brochures that advertise valley attractions and are distributed in the valley and throughout Puget Sound;
   - Attending trade shows to market valley attractions such as snowmobile shows, mountain bike shows, etc;
   - Developing a web page that tells of valley amenities and links to other public land web pages; and,
   - Developing an advertising slogan for the valley. (UNAC, business association)
5. Conduct a market analysis to determine which businesses are most likely to be successful in the valley. (UNAC, business association, Pierce County)

**MID-TERM ACTIONS**

1. Develop an interpretive forest tour that shuttles visitors through wild and managed forests. (UNAC, U.S. Forest Service, DNR)
2. Advertise the opportunity to learn mountaineering in one of the world’s best locations and from some of the world’s best mountain guides. (UNAC, business association)
3. Pursue dedication of areas in the valley for forest research opportunities with universities, public forest lands, and private timber companies. (UNAC)
4. Work with the Washington State Division of Tourism to develop a “mountain loop drive” that could include Mount Adams, Mount St. Helens, and Mount Rainier. (UNAC, PALS)
5. Organize an annual or bi-annual arts festival in the valley. (UNAC, Pierce County)
6. Coordinate with public land representatives regarding proposed changes in the management of public lands in decisions that affect the community. (UNAC)
7. Actively pursue public and private funding opportunities to support businesses and capital facility improvements:
   - Pursue grants to help small businesses and to recruit new businesses;
   - Pursue grants to assist in redevelopment of centers to comply with themes; and
• Work to keep hotel/motel taxes in the community for community improvements. (UNAC, Pierce County)

8. Market the valley for cottage industries and home occupations (including home-based computer operators). (UNAC, business association)

9. Investigate the establishment of a local business incubator to provide space for start-up industries consistent with the rural policies of the Comprehensive Plan. (UNAC, business association, Pierce County)

10. Develop performance standards for small scale industry which prevent the degradation of the natural environment (standards may relate to air or noise pollution). (UNAC, Pierce County)

11. Encourage the establishment of a master craftsmen’s guild that could market handcrafted wood products that use local hardwoods. The guild may offer apprenticeships and/or tours of the craftsman at work. (UNAC, business association)

12. Place advertisements in outdoor/backpacking/environmental magazines which inform readers that the valley is looking for strong, environmentally friendly businesses to locate in the valley. (UNAC, DNR, business association)

13. Create maps/brochures illustrating biking, hiking, skiing, horse trails -- distribute at sporting goods stores throughout Puget Sound. (UNAC, business association, U.S. Forest Service, DNR)

14. Encourage the Department of Natural Resources, U.S. Forest Service, and private timber companies to develop a policy for soliciting bids from valley operators. (UNAC)

15. Coordinate with the National Park so that information such as visitor data and traffic counts could be shared with the community to allow local businesses and residents to better plan and provide for the needs of visitors and local citizens. Information such as easy access to up-to-the-hour information regarding Park closures and road conditions should be disseminated throughout the community. (UNAC, business association, National Park)

16. Work in partnership with Mount Rainier National Park to encourage economic sustainability in the community by:
   • Encouraging development of private sector visitor services so as to improve competition, increase choices for visitors, and minimize the need for in-park facilities;
   • Providing camping facilities within the community based on needs assessment;
   • Marketing appropriate winter use activities within the park to encourage more off-season use;
   • Encouraging more weekday and off-season use to help distribute visitation “loading” away from peak, overcrowded summer weekend days;
   • Enhancing park interpretative capabilities within the “gateway community”; and
   • Becoming a transportation, housing, and food services hub to support park visitation and use. (UNAC, PALS, National Park)
LONG TERM ACTIONS

1. Establish linkages with technical/vocational colleges for training of employees. (UNAC, business community)
2. Establish an art exchange program with one of the urban areas. (UNAC)
Chapter 6: Facilities and Services Element

**Introduction**

The Infrastructure and Services Element articulates the need for facilities and services that will implement the visions and goals of the community plan. Facilities and services are collectively considered “infrastructure” and may include public and/or privately funded projects. The adoption of policy statements regarding infrastructure provides direction to investors and decision-makers about what investments are desired and needed by the community.

The policies of the Infrastructure and Services Element call for facilities and services that meet the needs of the local community (such as developing a community park or museum) while accommodating the needs of tourists without impacting the local citizens. The element also prioritizes the projects and suggests potential funding sources to complete the projects.

**Description of Current Conditions**

The Upper Nisqually Valley is rural and sparsely populated. Urban facilities and services such as bus services, libraries, parks, public restrooms, or sewer service are not available. However, in the summertime when more than ½ million tourists move through the area, some of these facilities or services would be helpful to defray the impact. The community plan recognizes the need for improved infrastructure. Some of the proposed improvements meet the needs of tourists while mitigating impacts to local residents and other proposed improvements are intended to strictly serve the local community. The most immediate need, and a top priority within the community plan, is for public restrooms. This need becomes ever more pressing as the Park celebrates its centennial in 1999.

**Sewer and Wastewater Treatment**

Two sewage treatment plants exist within the plan area: the Elbe wastewater treatment plant and the Tahoma Woods sewage treatment plant. The plant at Elbe is operated by the Elbe Water and Sewer District and services the community of Elbe. The Tahoma Woods plant is operated by Mount Rainier National Park and serves only the Tahoma Woods administration and housing facilities.
The Elbe treatment plant utilizes a mound system with sand filter providing secondary treatment. The plant has a treatment capacity of 29,000 gallons per day and presently serves approximately 35 households. There is a remaining treatment capacity for approximately 45 additional households. The Tahoma Woods treatment plant provides tertiary treatment which involves chlorination and percolation into the ground. The treatment plant has a permitted capacity of nine to ten thousand gallons per day and is currently operating at four to five thousand gallons per day.

**Domestic Water Systems**

Domestic water within the plan area is provided by individual on-site wells and six community water systems. The community water systems are the Ashford Water District, Elbe Water and Sewer District, Tahoma Woods water system, Holiday Hills water system, Nisqually Park Water Company, and the Alpine Village water system (see Map K-5: Water Systems). The largest of these systems is the Ashford Water District which is licensed for 500 connections with only 179 of those connections being utilized. Although the valley has six water systems, the conditions of the systems and their ability to expand is questionable. Tahoma Woods is currently operating at 40-50 percent capacity, however, it is unlikely that water service will be provided to adjacent landowners, as excess capacity is being reserved for future expansion of National Park facilities on the site. Four of the remaining five community water systems have a combined total of 385 licensed connections with 76 of those connections still available.

**Transportation**

**Roads and Highways**

The Upper Nisqually Valley is accessed through a variety of regional State highways and county arterials that provide access to and from the I-5 corridor. In Pierce County, SR 7 and SR 161 provide north/south access to Puyallup and Tacoma, while SR 702 provides east/west access to 507/510 leading to the I-5 corridor. Ashford and Elbe are both located along SR 706, which begins in Elbe and terminates at the entrance of the National Park. Access to the Upper Nisqually community through Lewis County is via SR 508, US 12 and SR 7. SR 508 extends from I-5 south of Chehalis eastward to Morton. US 12 begins at I-5, south of Chehalis and SR 508, through Morton where it intersects with SR 7 before continuing eastward over the Cascades to eastern Washington.

There are few County roads in the plan area due to the rural nature of the community. The County roads with the highest traffic volumes are Alder Cutoff Road, Kernahan Road, and Mt. Tahoma Canyon Road. Many of the County roads are narrow and have poor visibility. Drivers often cannot see far enough at intersections because of hills, curves, or brush overgrowth. Some of the roadways do not cross at 90 degree angles, which also reduces intersection visibility. Another concern is the condition of the roadway pavement.

Congestion is an important transportation issue in the Upper Nisqually Valley. While southern Pierce County does not experience a significant amount of commuter traffic, it does have high
volumes of recreational travel, which clogs the roadways and creates long traffic lines and parking problems. The recreation related congestion is seasonal, occurring in the warm summer months.

Visitors and tourists come to the South County area to boat on numerous lakes, tour Mount Rainier National Park, or to participate in any of a number of other activities, such as horseback riding, bicycling, or using recreational vehicles (four-wheeling).

Mount Rainier National Park has three main entrance stations located at Nisqually (SR 706), Stevens Canyon (SR 123), and the White River (SR 410). About 50 percent of the vehicle entries occur at Nisqually while Stevens Canyon and the White River each accommodate 25 percent (Final Report Transportation Feasibility Study, Mt. Rainier National Park, May 1995). The road from Nisqually entrance to Paradise is open year round.

The primary local routes in the Gifford Pinchot National Forest are Forest Roads 59, 5900037, and 5900079. Forest Service Road 59 extends north of SR 706 east of Ashford. It provides access into the Gifford Pinchot Forest and from it extends Forest Service roads 037 and 079. These roads are used for access to forest lands and recreational opportunities, such as hiking and trails.

The Washington Department of Natural Resources manages the Elbe Hills State Forest located immediately north of SR 706 between the areas of Elbe and Ashford and the Tahoma State Forest located south of SR 706 in the vicinity of Ashford. Elbe Hills has two entrances, Stoner Road which is open year-round, and the Elbe entrance which is open to motorized vehicles for the hunting season. The main roads in the Elbe Hills Forest are Roads 8, 9, and 800 which are open year-round and roads 5, 57, 7, 923, and 92 which are open seasonally. Tahoma State Forest has one entrance which is open year-round. The main roads in the Tahoma Forest are 1, 2, and 23 which are open in varying parts of the year.

### Rail Services

Railroad tracks are in place from the Port of Tacoma to National, with a branch line that extends through Mineral to Morton in Lewis County. Mount Rainier Scenic Railroad, which is funded by Washington Forest Industry Museum, operates an excursion train on a part of the line between Elbe and Mineral. In addition, the Mount Rainier Dining Company operates a dinner train over this same line segment extending to Morton.

The City of Tacoma owns the railroad tracks from near Freighthouse Square in Tacoma to Ashford and is interested in starting a “Train to the Mountain” passenger rail service. This train could bring tourists to the Upper Nisqually and Park areas. Shuttles would likely be established to transport people from place to place once in the Upper Nisqually area. The train trip from Tacoma to the Upper Nisqually would be completed in approximately 1.5 to 2 hours. A layover in the valley of at least three hours would be likely. Therefore, a round trip to the mountain would total approximately seven hours or a trip from 9:30 a.m. to 4:30 p.m.

Significant capital investments are necessary to complete the Train to the Mountain concept. Currently the rail line is a single track branch line with numerous curves and steep grades. The track would need to be brought to appropriate standards that would allow for freight and
passenger movement. Needed improvements include tie replacement, track improvement, resurfacing and lining of track, bridge rehabilitation, slope stabilization, ditch and culvert improvements, automatic crossing protections, and signage for public safety.

**PUBLIC AIRPORTS**

The Federal Aviation Administration (FAA) identifies no airports in the plan area. The closest facility is the Eatonville Airport, also known as Swanson Field, located east of Eatonville adjacent to the city limits and approximately six nautical miles (seven miles) north of Elbe. The airport, at an elevation of 850 feet, has a 3,000 foot long by 36 foot wide paved, lighted runway that is attended continuously. It is within the FAA’s Seattle Center airspace and can accommodate prop and turboprop airplanes, but not jets. There are two other public airfields in the vicinity. Strom Field in Morton and an airfield in Packwood can accommodate prop airplanes only.

**LAW ENFORCEMENT AND FIRE PROTECTION**

**Pierce County Sheriff**

The Pierce County Sheriff’s Department provides police protection to the plan area. The Department's Mountain Detachment office is located north of Eatonville at the junction of SR 161 and the Eatonville Cutoff, and serves a population of 30,000 in an area bounded by Fort Lewis, the Nisqually River, Mount Rainier National Park, the Puyallup River, and 224th Street South.

The detachment has a staff of one sergeant and ten deputies, with no clerical support. A minimum of two deputies are on duty between the hours of 7:00 a.m. and 3:00 a.m. If necessary, two mountain detachment deputies who reside in the plan area may be called in to provide additional support when necessary during off-duty hours.

**Washington State Patrol**

The plan area is within the Washington State Patrol's Zone 8. This zone serves all of Pierce County east of I-5. State troopers assigned to Zone 8 are dispatched from an office at 2502 112th Street E. There are two detachments on duty at all times, with one trooper in each detachment assigned to a region which includes the plan area.

**Fire Protection**

The plan area is served by Pierce County Fire District No. 23. The District has two fire stations: Station One is on SR 706 on the west side of Ashford, and Station Two is at 18109 541st Street in Elbe. Currently, the average response time is 10 minutes, 13 seconds. Equipment at Station One in Ashford includes:

- 1 Life Support)
- 1 1985 pumper (1,250 gallons-per-minute (GPM) with 750 gallon tank)
- 1 1994 tender (1,500 gallon capacity manufactured in 1975)
- 1 1988 3/4 ton utility rescue truck (carries pump and 75 gallon tank for brush fires in the summer time)
- 1 1973 Snow Cat (used for winter rescues)
- 1 trailered breathing air compressor and 5 KW generator

Equipment at Station Two in Elbe includes:
- 1 1988 ambulance (Basic Life Support)
- 1 1979 pumper (1,000 gallons-per-minute (GPM)) with 750 gallon tank
- 1 1992 tender (1,500 gallon capacity manufactured in 1975)
- 1 1986 4x4, 1 ton brush truck with 240 gallon tank and pump
- Assigned 24 hour response vehicles:
  - 1993 4X4 sport utility command vehicle (Fire Chief)
  - 1986 1-1/4T 4X4 brush-utility flatbed (Assistant Chief)

The combined staff at the two fire stations include:
- 1 full-time paid fire chief
- 1 assistant volunteer chief
- 1 part-time paid secretary
- 5 volunteer lieutenants
- 1 part-time, paid maintenance person (2 days a week) responds as a volunteer on calls
- 1 volunteer paramedic
- 10 volunteer firefighter emergency medical technicians (EMT’s)
- 5 volunteer first responders
- 3 volunteer firefighters
- 3 volunteer support members (traffic control, rehab, support functions)

Both stations have restroom and kitchen facilities. Both stations are frequently used as community meeting facilities. Station One at Ashford is also used as a base for search and rescues and natural disasters by the Pierce County Sheriffs office, Lewis County Sheriffs office, DNR and other agencies as needed. Both stations are equipped with emergency power, blankets, and emergency first aid supplies, as well as two-way VHF radio, CB communications and HAM radio antennas.

PUBLIC SCHOOLS

The plan area is served by Eatonville School District No. 404. The District includes three elementary schools, a middle school, and a high school, with a total capacity of 1,819 students. Columbia Crest Elementary School is located between Elbe and Ashford. From 1990 to 1996, enrollment at the school has ranged from a low of 207 students to a high of 228 students. As of September 1998, enrollment at the school is 212 students.
### Parks and Recreational Areas

There are numerous parks and recreational areas within the Upper Nisqually Valley. Most of these facilities are built to attract visitors on a regional, State, or national basis. Park and recreational areas within the plan area include:

<table>
<thead>
<tr>
<th>Park Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Alder Lake Park</strong></td>
<td>The 148-acre Alder Lake Park is located off State Highway 7 near Alder Dam, and is owned and maintained by the City of Tacoma. The park is open throughout the year and includes numerous amenities such as boat ramps and docks, campgrounds, an RV dump station, picnic areas, swimming beaches and restrooms.</td>
</tr>
<tr>
<td><strong>Sunny Beach Point Day-Use Park</strong></td>
<td>The 9-acre Sunny Beach Point is a day-use park located off of State Highway 7 at the Eatonville Cut-off Road, and is owned and maintained by the City of Tacoma. Facilities include a swim beach, sunning area, water ski dock and area, picnic shelter, 20 picnic sites with tables and grills, restrooms, and parking for 65 vehicles. The park operates only in summer.</td>
</tr>
<tr>
<td><strong>Rocky Point Day-Use Park</strong></td>
<td>Rocky Point is a small day-use park located on the north shore of Alder Lake, off State Highway 7, west of Elbe, owned and maintained by the City of Tacoma. The park operates only in summer.</td>
</tr>
<tr>
<td><strong>Elbe Hills State Forest</strong></td>
<td>Elbe Hills State Forest is owned and managed as timber and recreational resource area by the State Department of Natural Resources. Several recreational facilities are located within the state forest including Sahara Creek Campground, Sahara Creek/Nicholson Horse and Hiking Trail System, and the Elbe Hills Off-Road Vehicle (ORV) Campground.</td>
</tr>
<tr>
<td><strong>Tahoma State Forest</strong></td>
<td>Tahoma State Forest is owned and managed as a timber and recreational resource area by Washington State Department of Natural Resources. Tahoma State Forest is located south of Ashford, outside of the Upper Nisqually Valley Community Plan area. It is accessible only through the National entrance off the State Highway 706.</td>
</tr>
<tr>
<td><strong>Mount Tahoma Ski Trails</strong></td>
<td>The ski trails system consists of 100 miles of cross country skiing on snow covered logging roads. The trail system is a partly connected system of ski trails and huts located in Elbe Hills State Forest, Tahoma State Forest land, privately owned Champion Company timberland, Mt. Baker Snoqualmie National Forest Land, and Mt. Rainier National Park.</td>
</tr>
</tbody>
</table>
**Mt. Baker Snoqualmie National Forest**

A part of the Mount Tahoma Ski Trails is located in Mt. Baker Snoqualmie National Forest. A snowpark and trailhead located near Copper Creek off Road 453 provide access to the Mount Tahoma Ski Trails.

**Mt. Rainier National Park**

Visitor centers, hiking trails, lodging, mountain climbing, auto camping, back country camping, and picnic areas are located throughout the Mt. Rainier National Park. The following summarizes major recreational facilities within the Park:

- Visitor centers are located at Longmire, Paradise, Ohanapecosh, and Sunrise.
- There are approximately 240 miles of hiking trails which are generally accessible from June or early July until early October. Nearly 100 miles of park trails are open to equestrian use.
- There are 11 different picnic areas with a total of approximately 320 tables within the Park in addition to 211 roadside tables and one picnic shelter scattered around the Park.
- There are two hotels located within the Park. The hotels are managed by Mount Rainier Guest Services. National Park Inn at Longmire has 25 rooms, a full service restaurant, and gift shop. Six rooms are fully accessible for individuals with disabilities. Paradise Inn at Paradise has 126 rooms, full service restaurant and lounge, gift shop, and snack bar.

Five automobile campgrounds provide a total of approximately 580 sites. They are in five locations within the Park:

- Sunshine Point (SW entrance): 18 individual sites, open year round, approximately 0.5 mile from the Nisqually entrance.
- Cougar Rock (SW entrance): 200 individual sites (including 60 pull-through sites) and 5 group sites, open late May to mid-October, approximately 7.25 miles from the Nisqually entrance.
- Ohanapecosh (SE entrance): 205 individual sites, open late May to mid-October, approximately 1.25 miles from the Stevens Canyon entrance.
- White River (NE entrance): 117 individual sites, open late June to late September, approximately 6 miles from the White River entrance.
- Ipsut Creek (NW corner): 29 individual sites and 2 group sites, open year-round (weather permitting), approximately 4.5 miles from the Carbon River entrance.

**Pierce County Library System**

The plan area is served by the Pierce County Library System. The Eatonville branch library is the closest Pierce County library to the plan area. The library has a total floor space of 4,200 square feet, 2.6 full-time library staff, and approximately 14,000 catalogued books in its collection.
total collection size is 26,503. The library is open 28 hours per week. In addition, a bookmobile travels to Elbe and Ashford on one weekday and on Saturday.

**Electricity**

Electric power is supplied to the plan area from two sources. The Lewis County Public Utility District (PUD) supplies electric power to the area outside of the Alder area, generally from Elbe to Mt. Rainier National Park along the SR 706 corridor. The other is the Alder Mutual Light Company supplying electric power to the Alder area.

The Lewis County PUD distribution line for the district’s Elbe substation has a maximum capacity of 5 megawatts, with 3.7 megawatts of that capacity currently being used by customers, leaving available capacity for future use at 1.3 megawatts. The district estimates that the 1.3 megawatts of future reserve capacity can serve an additional 150 residential customers. Both the size of the distribution line and the current voltage at which it is operated limit growth beyond 5 megawatts.

The Lewis County PUD is in the process of upgrading the Elbe Substation and the distribution feeders extending east and south from the town of Elbe. The project involves increasing the substation distribution voltage and upgrading the distribution feeder voltages from 14 Kv to 25 Kv. Phase I of the project includes replacement of the substation transformer and increasing the distribution voltage of the substation and the distribution feeders approximately 3 miles east and 4 miles south. To date the District has completed most of the design and material’s procurement work for Phase I. Phase I is scheduled to be completed this summer, with work starting in June.

Phase I will increase the District’s service capability to the area upgraded approximately twofold. Phases II and III, which will upgrade the feeder voltage to Ashford and the Kernahan Road, are expected to be completed within the next 5 years.

**Solid Waste**

Refuse collection and curbside pickup of recyclables is available to residential and commercial customers by Harold LeMay Enterprises, Inc., franchised under the authority of the Washington Utilities and Transportation Commission. Yard waste pickup service is not available, as the plan area is located outside the permanent burn ban area established by the Puget Sound Air Pollution Control Authority. Household hazardous wastes are not collected on a regular basis in the plan area, however, they can be brought to disposal facilities at the City of Tacoma Landfill.

**Description of Desired Conditions**

The community wants to be able to meet the summertime needs of the tourist population without overburdening the local citizens with taxes to complete infrastructure projects. Further, the community is interested in retaining its rural character and privacy. The plan policies recognize the need for new facilities and services for both the tourists and the local community. These projects are intended to help improve the economy and mitigate the
impacts of the large numbers of visitors. Table K-14 lists a number of potential facility and infrastructure improvement projects which are not imperative to implement the plan. The projects simply provide more amenities to the community or provide a more cost-effective means of development. Project costs are not identified on Table K-14 because: (1) the projects are not necessary to implement the community plan; and (2) the majority of projects require a feasibility study which would reveal the true costs of capital improvements. For example, a feasibility study is necessary to determine whether development in Ashford would be better served by a community septic system or individual onsite septic systems. Until the feasibility study is complete, it is difficult to estimate the costs of a community septic system. The feasibility studies will assist in determining the most cost-effective and efficient manner in which to provide public facilities for future growth.

Permits are not issued in Pierce County if septic disposal, storm drainage, potable water, and fire flow are not available. If a development proposal does not have the appropriate facilities and services available to meet Pierce County level of service standards, no permit will be issued.

**Recreation**
Bike and Barrier Free Trails | 3 | | | | 
1) Feasibility Study | | | (X) | | 
Community Benefit: Encourage outdoor recreation throughout the Upper Nisqually Valley as an alternative to the crowded National Park. Provide a connection between centers.

**Community Gatherings**
Community Center and Park | 2 | X | (X) | | 
Museum and Information Center | 7 | X | (X) | | 
Kiosks | 9 | X | (X) | | 
Community Benefit: Enable a greater sense of community by providing a community gathering place where people may relax. Encourage visitors to stop and leave their cars by providing information on the history of the Upper Nisqually Valley. Inform the community and its visitors of local & park events.

CDBG - Community Development Block Grant
Before CDBG funds could be used, an income eligibility survey for the centers would need to be conducted. Also, competition for these funds is extremely competitive and if awarded would probably provide only a portion of the total amount required.

USDA - US Department of Agriculture
The USDA offers several loan programs which could be accessed, including Community Facilities loans and Rural Development loans.

EPA - RCAP - Environmental Protection Agency Rural Community Assistance Program
RCAP is a network of non-profit agencies that can provide on-site technical assistance in needs assessment, financing, technology selection, operation, and maintenance practices.

## Sewer and Wastewater Treatment
Within the next 20 years, the Upper Nisqually Valley is expected to experience the majority of commercial and residential growth within the Village Center zone. In order to accommodate this growth, improvements will need to be made to the local sewer and wastewater treatment systems.

Since Elbe currently has a treatment system that has available capacity, the focus in the community plan is on Ashford. The desired condition is to have a treatment system that can support the planned growth in Ashford. This system may consist of one large community septic system, a series of smaller community septic systems, or individual on-site septic systems. The policies of the community plan call for an inventory of present conditions (capability of local soils to treat wastewater) and an evaluation of options to meet the treatment needs. The inventory may point to the need for one large community system or several smaller systems within Ashford.
DOMESTIC WATER SYSTEMS

Similar to sewer and wastewater treatment, the need for improving the water systems needs to be inventoried and evaluated. The desired condition is to have water facilities and services to accommodate the needs of residents and visitors. Although there appears to be an ample supply of available groundwater, some of the water systems need more water rights to access the water or need to upgrade facilities in order to convey the water to users. For example, the Ashford Water District would need to upgrade and resize its conveyance pipes and pumphouses in order to serve anticipated growth. The policies of the community plan call for an inventory of the current systems and an evaluation of upgrade and repair options to meet the future needs.

TRANSPORTATION

The desired condition for the Upper Nisqually Valley is to improve the transportation system to accommodate tourists while minimizing the impacts to local citizens. Public restrooms and rest areas are a top priority for the community as it cannot continue to be inundated with a summertime urban tourist population with no rest stop facilities. The policies in the community plan call for constructing pedestrian facilities such as sidewalks, boardwalks, and striped crosswalks in centers to encourage tourists to leave their cars and shop/tour the Upper Nisqually centers. A barrier-free trail system is desired to be constructed to provide a connection between Alder and the National Park with access to the Nisqually River and surrounding public lands. In order to accommodate large numbers of visitors to the National Park without impacting local citizens, two items are desired: a public parking facility to help accommodate RV and many cars, and a shuttle system which will move people from Puget Sound up to the Park or from the valley into the Park.

LAW ENFORCEMENT, FIRE PROTECTION, AND EMERGENCY MANAGEMENT

The desired condition is to improve the resources and funding available in law enforcement, fire protection, and emergency management to accommodate the summertime visitors and population without impacting local citizens. The strategies contained in the community plan ask for funding and support from other agencies such as the National Park, Forest Service, Department of Natural Resources, and Tacoma Power to help the local agencies handle the summertime overload.

Secondly, the community recognizes Mount Rainier as a volcanic hazard and chooses to take measures to ensure the safety of citizens and visitors. The policies in the community plan call for an evacuation plan with a public education program to be prepared by the year 2002.
**Public Schools**

The plan does not contain any policy direction pertaining to the elementary school. The plan does encourage the establishment of a work training program in the Upper Nisqually Valley through a technical college.

**Parks and Recreational Areas**

The Upper Nisqually Valley has numerous recreational opportunities that are designed to attract visitors on a regional, State, or national basis. These recreational opportunities include the National Park and national and State forests. The residents of the Upper Nisqually Valley would like a local park to be developed for the community to use for baseball games, basketball, tennis, picnicking, or other recreational opportunities.

At the present time, a 23-acre site in Ashford is being considered for a potential future community park. Once public ownership is secured, the community park would provide a central gathering place and recreational facility for area residents.

The community plan also calls for the development of a museum and/or an information center. The museum would be a historical museum that would house local development and history information. The information center would be oriented to sharing local information to tourist and visitors but would likely contain historical information as well.

**Pierce County Library System**

The community is content with the availability of the Eatonville Library and bookmobile. The plan does not contain any policy direction pertaining to the library system.

**Electricity**

Electrical supply is not an issue within the community plan area; however, the community would like to see utility lines placed underground whenever possible. Recently, a bald eagle was lost after becoming entangled in utility lines. Community plan policies strive to improve the appearance of the valley and reduce risks to wildlife by placing utility lines underground.

**Solid Waste**

The community plan does not contain any policy language pertaining to solid waste disposal.

**Stormwater Facilities**

Currently, each development or property owner is expected to meet standards for stormwater retention in accordance with Pierce County Code. In recent years, this code has become more stringent regarding the amount of discharge that leaves a developed site and can require a
significant portion of land to be dedicated to stormwater holding ponds. The policies in the community plan call for stormwater facilities to be combined where possible.

**CAPITAL FACILITIES POLICIES**

**GOALS**

We envision a valley with infrastructure and services that meet the needs of area residents, businesses, and visitors while providing for the health and safety of individuals.

**GENERAL**

**GOAL UNV CF-1**  
Infrastructure placement should be compatible with the visual environment.

**UNV CF-1.1**  
The siting and design of infrastructure projects should blend with the natural and surrounding built environment.

**UNV CF-1.2**  
Capital facilities should conform to adopted design standards and guidelines.

**UNV CF-1.3**  
Any publicly-funded facilities should conform to adopted design standards and guidelines.

**UNV CF-1.4**  
Develop a museum/information center in one of the Village Centers for display of information relating to the history and natural resources of the Upper Nisqually Valley.

**UNV CF-1.5**  
Encourage the national park, U.S. Forest Service, and private timber companies to provide information for the museum/information center.

**UNV CF-1.6**  
Encourage the development of public parking lots in Elbe and Ashford.

**UNV CF-1.7**  
Developments that have a significant impact upon the schools, traffic, and housing availability shall be required to provide mitigation of impacts to less than significant levels.

**REST AREAS**

The intent of the rest areas policies is to address the need for restroom and rest area facilities.

**GOAL UNV CF-2**  
Provide capital facilities and services which mitigate impacts caused by tourists.

**UNV CF-2.1**  
Develop public rest areas and restrooms in the valley.

**UNV CF-2.2**  
Public restrooms should be available within centers.

**UNV CF-2.3**  
A rest area which serves motorists and non-motorists shall be located in or immediately adjacent to one of the Village Centers.

**UNV CF-2.3.1**  
The rest area should have a site design which encourages individuals to visit and shop in the center.

**UNV CF-2.3.2**  
The rest area shall meet the design standards of the Village Center.
UNV CF-2.3.3 The rest area should display historical information about the Upper Nisqually Valley.

UNV CF-2.4 In siting a rest area, consideration should be given to minimizing potential traffic hazards and congestion.

UNV CF-2.5 Rest area buildings should represent the historic character through a train station design.

QUALITY OF LIFE

The intent of the quality of life policies is to identify those facilities and services that are needed in the Upper Nisqually Valley to maintain or improve the quality of life and mitigate the impacts of new development.

GOAL UNV CF-3 Develop capital facilities and services which maintain or improve the community’s quality of life and mitigate the impacts of development.

UNV CF-3.1 Construct facilities and provide services which improve the health, safety, and welfare of community residents.

UNV CF-3.2 Identify the Upper Nisqually Valley as a high priority for developing an emergency evacuation plan.

PARKS AND RECREATION POLICIES

GOAL UNV PR-1 Provide facilities and services for the community and visitors.

UNV PR-1.1 Develop a barrier-free trail system for walkers, hikers, and cyclists that provides access to the Nisqually River, public lands, and the national park along the trail system.

UNV PR-1.2 Place historical or environmental interpretive signs along the trail.

UNV PR-1.3 Develop a park for use by local residents and supported by Pierce County Parks and Recreation.

UNV PR-1.3.1 Include indoor and outdoor facilities in the park along with passive and active recreation opportunities such as baseball fields, basketball courts, play equipment, a climbing rock, a community center, restrooms, natural areas, and picnic area.

UNV PR-1.3.2 Encourage residents and businesses to donate labor and materials for the construction of community facilities.

UNV PR-1.3.3 The design of the park should be oriented away from SR 706.

UNV PR-1.3.4 Buildings in the park should meet design standards for Village Centers.
TRANSPORTATION POLICIES

The intent of the transportation policies is to recognize that traffic congestion can be a detriment to the community during the peak tourist season and to seek alternative modes of transporting visitors through the valley to reduce congestion.

GOAL UNV T-1

Provide a variety of transportation alternatives to decrease seasonal traffic congestion, maintain the rural character, and conserve air and water resources.

UNV T-1.1 While encouraging tourism, reduce the number of vehicle trips through the Upper Nisqually Valley.

UNV T-1.2 Promote a variety of transportation options such as transit, bike trails, pedestrian facilities, and shuttle services.

UNV T-1.3 Permit land use patterns which allow residents and visitors to access multiple businesses and services with one stop.

UNV T-1.4 Permit facilities which support nonmotorized transportation and high occupancy vehicles.

UNV T-1.5 Encourage the national park to promote employee use of shuttles or carpools to work during the peak season.

UNV T-1.6 Pursue development of a bike shoulder along SR 706.

GOAL UNV T-2

Encourage transportation services that facilitate tourism.

UNV T-2.1 Transportation services that move large numbers of people and reduce reliance on the automobile are encouraged to reduce traffic.

UNV T-2.2 Encourage development of a shuttle system with stops in Alder, Elbe, Ashford, and the park entrance.

UNV T-2.2.1 Design the shuttle system to accommodate the needs of visitors and employees.

UNV T-2.3 Encourage development of the Train to the Mountain if financially feasible.

UNV T-2.4 The Village Center in Ashford is the preferred site for passenger rail.

UNV T-2.5 Develop public parking facilities within Rural Gateway Communities.

UNV T-2.6 Establish a transit connection or bus route between the communities of Ashford and Graham.

GOAL UNV T-3

New commercial, subdivisions, multifamily, and employee housing developments may be required to upgrade existing roads to meet an increased road standard.

UNV T-3.1 New development shall provide on-site pedestrian facilities in Village Centers.

UNV T-3.2 If a road improvement is required for a new development, installation of sidewalks shall be required along the improvement.
Rural Gateways

The intent of the Rural Gateway Communities infrastructure policies is to recognize the need for infrastructure improvements that would support pedestrian-oriented commercial centers.

GOAL UNV T-4 Construct pedestrian facilities throughout Village Centers.

UNV T-4.1 Improve pedestrian facilities within the Village Centers zone through boardwalks, sidewalks, and crosswalks.

UNV T-4.2 The materials used in the construction of the pedestrian routes should be consistent with the rural character of the Upper Nisqually Valley.

UNV T-4.3 The pedestrian circulation pattern should connect all the businesses within the Village Center.

GOAL UNV T-5 Street lighting should be provided to improve safety.

UNV T-5.1 Street lighting should be of historic character.

Utilities Policies

Septic

The intent of the waste disposal policies is to recognize that unsafe waste disposal practices are a detriment to water resources and community health. The policies are intended to educate and encourage cooperation to terminate unsafe waste disposal practices.

GOAL UNV U-1 Determine the need for community septic systems in Ashford.

UNV U-1.1 Support a soil assessment study to determine if a single community septic system or several smaller community septic systems are needed to achieve desired village densities. The study should make recommendations about the location, types of systems, and potential sources to construct systems.

UNV U-1.2 Investigate private and public funding sources available to construct community septic system(s).

UNV U-1.3 Pierce County shall provide guidance to the community in conducting the soil assessment and design and construction of any community systems.

UNV U-1.4 Educate local property owners about the financial and environmental benefits of a community septic system.

GOAL UNV U-2 Reduce the risk of unsafe waste disposal practices and septic tank failures.

UNV U-2.1 Recognize that improperly functioning septic systems can have detrimental impacts to the natural environment and human health.

UNV U-2.2 Educate residents and business owners about the:

UNV U-2.2.1 Importance of septic maintenance;
Proper installation of a system;
Proper maintenance of a system;
Latest technology in septic design;
Health department regulations and enforcement;
Latest technology in septic design;
Health department regulations and enforcement;
How and where to obtain loans and financial assistance.

Support public and private funding mechanisms for replacement or repair of failing septic systems.
Consider replacing individual systems with multi-user systems.
Work with the railroad companies to stop the dumping of sewage along tracks.

STORMWATER

GOAL UNV U-3 Determine the need for a community stormwater system in Ashford and Elbe.

UNV U-3.1 Support an assessment study to determine if a community stormwater system is needed to achieve desired commercial intensity. The study should make recommendations on the location, types of systems, and potential sources to construct systems.

UNV U-3.2 Investigate private and public funding sources available to construct community stormwater system(s).

UNV U-3.3 Educate local property owners about the financial and environmental benefits of a community stormwater system.

IMPLEMENTING ACTIONS

The following is a list of actions that should be completed in order to implement the policies contained within this plan. They are arranged according to the timeframe within which each should be completed; short, medium, or long term. Short term actions should occur immediately or within one year of plan adoption. Mid-term actions should be completed within 2-5 years. Long term actions should be completed within 5-20 years of plan adoption. The party or parties responsible for leading the effort to complete the action item is listed in parenthesis following the action. Actions are assigned to the Gateway Community Advisory Board (GCAB), the Upper Nisqually Advisory Commission (UNAC), the Washington Department of Natural Resources (DNR), the U.S. Forest Service (USFS), Mount Rainier National Park, or Pierce County Planning and Land Services (PALS). The local business association is also listed as they are recognized as a major influence within the Upper Nisqually Valley. Those actions assigned to the GCAB are completed as part of the adoption and implementation of this plan.
Short Term Actions

1. Work with the Washington State Department of Transportation to ensure the rest area is designed to meet the design standards identified in the community plan. (UNAC, Pierce County)

2. Determine if the current rest area proposal meets the objectives and policies of the community plan. If necessary, review and propose other potential sites. (UNAC)

3. Work with Pierce County Fire District #23 to develop an emergency management evacuation plan by January 2002. (UNAC, Pierce County)

Transportation

4. Allow for transportation facilities that would accommodate a shuttle system in each of the centers. (GCAB, UNAC)

5. Allow a passenger rail station to be located in Ashford. (GCAB, UNAC)

Mid-Term Actions

1. Discuss possible funding opportunities or matching funds to improve community services with representatives from the National Park, U.S. Forest Service, DNR, and Tacoma Power. (UNAC, Pierce County)

2. Work with the Tourist Division of Washington State Department of Community, Trade and Economic Development to assist in funding community facilities. (UNAC, Pierce County)

3. Encourage the Pierce County Public Works and Utilities Department and Washington State Department of Transportation to include capital facility improvements in their appropriate planning documents. (UNAC, Pierce County)

4. Work with Pierce County to earmark a percentage of the hotel/motel tax revenue collected from businesses throughout the County for community facilities and services in the Upper Nisqually Valley. (UNAC)

5. Coordinate with the Lewis County Public Utility District (PUD) commissioners and managers about the goals and objectives of the Upper Nisqually Valley Community Plan. (UNAC)

6. Identify potential economic benefits to the PUD associated with the community plan. (UNAC, business association)

7. Pursue funding opportunities for public restrooms in Village Centers. (UNAC)

8. Investigate and pursue (if feasible) a community stormwater system:
   - Secure a grant for conducting a stormwater system study;
   - Implement the recommendations of the stormwater system study;
   - Convene a community forum which educates local property owners about establishing a community stormwater system;
   - Research funding opportunities for construction of a community stormwater system; and,
• Work with the Washington State Department of Community, Trade, and Economic Development to obtain funding for a community stormwater system. (UNAC, Pierce County)

9. Educate citizens and visitors about the emergency evacuation plan:
• Develop and distribute educational materials and brochures to citizens and visitors regarding volcanic hazards and the evacuation plan;
• Place maps of the emergency evacuation plan at community kiosks;
• Incorporate information about the evacuation plan into campground education programs; and,
• Place maps and information about the emergency evacuation plan at visitor centers within Mount Rainier National Park. (UNAC, National Park, USFS, business association, Pierce County)

10. Pursue improvement of emergency services:
• Meet with Pierce County Fire District #23 to assess funding, equipment, and staffing needs;
• Prioritize the list of needs within the District;
• Seek grant opportunities for improving emergency funding; and,
• Recruit commercial businesses as a means of expanding the tax base for emergency services. (UNAC, DNR, business association)

11. Investigate and pursue (if feasible) a community septic system in Ashford:
• Secure a grant for conducting a soil assessment study;
• Implement the recommendations of the soil assessment study;
• Convene a community forum which educates local property owners about establishing community septic systems;
• Research funding opportunities for construction of community septic systems; and,
• Work with the Washington State Department of Community, Trade, and Economic Development to obtain funding for a community septic system. (UNAC, Pierce County)

12. Investigate and pursue upgrading the Ashford water system:
• Secure a grant or a funding source to complete an update to the Comprehensive Water System Plan;
• Implement the recommendations of the Comprehensive Water System Plan update;
• Research funding opportunities for upgrading the water system; and,
• Obtain the approvals necessary to incorporate the updates through the Pierce County Health Department and the State Department of Health. (UNAC, Pierce County)

Parks

13. Develop a barrier-free trail system:
• Conduct a feasibility study to determine trail users, routes, cost estimates, potential funding sources, maintenance options, and a timeline for development;
• Conduct public workshops to solicit public comments on trail development; and
• Develop a strategy to fund and construct the trail system. (Pierce County Parks, PALS, UNAC)

14. Develop a park:
• Work with Pierce County Parks and Recreation and review the current proposal for a park and ensure it is consistent with policies and design standards of the community plan;
• Work with the Pierce County Parks Department to incorporate any new modifications and determine the roles and responsibilities in the maintenance of the park;
• Conduct public workshops to solicit public comments on park development; and
• Support Pierce County Parks and Recreation when seeking funds for park development. (PALS, UNAC)

Transportation

15. Encourage the Pierce County Public Works and Utilities Department and Washington State Department of Transportation to include capital facility improvements in their appropriate planning documents. (UNAC, Pierce County)

16. Map the public road right-of-way in the Village Centers where the pedestrian paths would be located. (Pierce County)

17. Identify the preferred placement of street lighting. (UNAC)

18. Work with Pierce County Public Works to develop a program to place pedestrian facilities within Village Centers. (UNAC, PALS)

19. Investigate and pursue the development of public parking facilities in Rural Gateway Communities. (UNAC, Pierce County)

20. Work with the Washington Department of Transportation to develop a bike shoulder along SR 706.

21. Work with the Pierce Transit Board to establish a transit connection or bus route between Ashford and Graham.

LONG TERM ACTIONS

1. Work with the Lewis County PUD to research funding options for moving utility lines underground. (UNAC)

2. Investigate the impacts of requiring all new development to place utility lines underground. (UNAC)

3. Periodically update the list of capital facilities needed to support the Village Center concept. (UNAC)

4. Develop a museum/information center:
• Conduct a feasibility study to determine museum users, locations, cost estimates, potential funding sources, maintenance options, and a timeline for development;
• Ask the National Park and US Forest Service to provide technical assistance in developing interpretive displays at the museum or information center;
• Conduct public workshops to solicit public comments on museum development; and
• Develop a strategy to fund and construct the center. (PALS, UNAC)

**Transportation**

5. Work with the National Park and Pierce Transit to develop a transit plan and encourage development of a shuttle system. (UNAC)
Domestic Water Systems

- Alder Lake Community Water System
- Alder Lake Park
- Alexander's Country Inn
- Alpine Village Property Owners
- Ashford Water District
- Citizens Water Association
- Columbia Crest Elementary School
- Gateway Inn
- Holiday Hills Comm Club Inc.
- Nisqually Park Water Co.
- Tahoma Woods *
- Wild Berry Restaurant

* Sewer and Wastewater Treatment also provided

Note: Updated with new water systems 2/5/99

Upper Nisqually Valley Community Plan

Pierce County, Washington

Department of Planning and Land Services
Plot Date: November 26, 2007

Water Resources
Chapter 7: Plan Monitoring

**Purpose**

The 1990 State Growth Management Act (GMA) requires jurisdictions planning under GMA to report on progress made in implementing the Act, and to subject their comprehensive plans to continuing evaluation and review. As part of the County’s Comprehensive Plan, the Upper Nisqually Valley Community Plan is subject to this requirement. One mechanism for conducting this evaluation and review is to monitor the development standards, regulations, actions, and other programs called for in the plan for the purpose of determining their effectiveness in fulfilling the vision of each of the five elements of the plan.

This chapter provides a framework both for monitoring the various actions undertaken to implement the plan and for offering recommendations to make adjustments to the actions in order to better fulfill each of the visions in the plan. Actions may include the development and implementation of regulations and design standards, working with State and Federal agencies to develop programs, organizing community groups and events, developing interpretive and educational programs, conducting community forums, and other actions. This framework for monitoring provides a means for measuring the effect of each action, identifies participants and their roles in monitoring the actions, lays out time frames for monitoring, and specifies how the monitoring program should be documented. Information obtained from the monitoring program will be used to offer recommendations to decision makers as to what changes to the community plan may be needed in order to attain specified goals and meet the visions in the plan.

**How to Measure the Effect of Standards**

The Upper Nisqually Valley Community Plan identifies actions which should be implemented to meet its visions, goals, and objectives. Monitoring evaluates the effectiveness of the actions in fulfilling these visions, goals, and objectives. The monitoring program outlined here includes several steps which are intended to identify actions taken, the ease with which they can be used, and whether the actions actually fulfill the objectives they were intended to fulfill.

To do this, the monitoring program is divided into five steps: Actions, Inputs, Process, Outputs, and Outcomes. Each of the steps and the responsible participant is discussed briefly here.

**Phase 1: Actions.**

Phase 1 monitoring would consist largely of reviewing the visions, objectives, policies, and actions stated in the plan and identifying all the actions which need to be undertaken to be consistent with the plan. The actions should be grouped according to the objectives they are intended to meet. PALS staff and the Upper Nisqually Advisory Commission (UNAC) would be the primary participants in this activity. A report from PALS would be submitted to UNAC for review.
PHASE 2: INPUTS:

Phase 2 monitoring would determine whether actions called for in the plan have actually been undertaken and completed. PALS staff would evaluate if regulations and design standards have been adopted. Review to determine if other actions, such as community forums or other events, have been completed could be done by UNAC, PALS staff, and event organizers.

PHASE 3: PROCESS:

Phase 3 monitoring would evaluate whether an action is straightforward, understandable, or easy to use. In the case of regulations and design standards, those persons who have submitted permit applications requiring compliance with these regulations and design standards would need to be involved in the evaluation. Citizen advisory boards which review such applications, as well as PALS staff, would also be included in the monitoring. PALS staff would coordinate the monitoring and could conduct interviews or distribute questionnaires to persons who have submitted or reviewed permit applications subject to the regulation being monitored. Monitoring of other actions, such as events and ongoing activities, would include event organizers and participants, UNAC, and PALS staff.

PHASE 4: OUTPUTS:

Phase 4 monitoring would determine whether the action has been carried out as stated in the plan. For example, monitoring would determine whether a regulation or design standard has been complied with and identify reasons for any noncompliance. In regard to events and ongoing activities, monitoring would determine whether the immediate objectives of the activity have been met. Participants would include residents, property owners, the UNAC, and PALS staff.

PHASE 5: OUTCOMES:

Phase 5 monitoring would evaluate the extent to which each action results in the desired effect on the community. The primary participants are the residents and property owners in the plan area. Assistance would be provided by the UNAC and PALS staff. The UNAC would need to provide a forum in which adopted vision statements are reiterated to residents and property owners. PALS staff would assist in organizing public meetings, preparing and distributing questionnaires, and using other means to gather information.

TIMELINE

It is anticipated that the Upper Nisqually Valley Community Plan will take a substantial period of time to be implemented. There are a number of actions that can be accomplished within a short timeframe, some will take much longer, and others will involve ongoing actions with no specific completion date. It is important that monitoring be done on a continuing basis with specific actions monitored at different times.
In regard to monitoring the development and implementation of regulations and design standards, it would be appropriate for monitoring to be phased over time as the five phases outlined above are accomplished. Phase 1 would begin almost immediately upon the plan adoption. Phase 2 would take place within two years following the plan adoption. This would provide adequate time for the County Council to adopt implementing regulations called for in the plan. Phases 3, 4, and 5 would occur within two to three years following completion of Phase 2. This would allow time for the regulations to be applied to a number of development projects. Phase 3 analysis of how understandable the regulations are, and the ease to which they can be applied, would then be based on the application of the regulations to those projects developed within that time period.

Phases 4 and 5 monitoring would be done simultaneously with Phase 3 monitoring. The total time for initial monitoring for Phases 1 through 5 would be about five years. As changes are made to regulations and design standards, the monitoring cycle would need to be repeated to address the changes.

Other actions which do not involve the implementation of regulations or design standards would be monitored on a similar timetable. Phase 1 and Phase 2 would occur within two years of adoption of the plan, while Phase 3, 4, and 5 monitoring would occur within five years of plan adoption.

As amendments are made to the plan, monitoring would need to continue to determine how effective the changes are in carrying out the visions in the plan. In addition, it would be appropriate to continue monitoring all actions in the plan every five years to evaluate whether the actions continue over time to effectively carry out those visions.

**Documentation**

A review of baseline information is necessary to effectively monitor whether the objectives of the Upper Nisqually Valley Community Plan are being met. Information regarding community attitudes, visual characteristics of the community, community services, infrastructure, business climate, land uses, permitting activity, and other community characteristics would be evaluated.

The plan and other documents provide much of the baseline information. It may be necessary, however, to supplement that information prior to effectively monitoring the plan. As each phase of monitoring is completed, a report should be prepared by PALS staff which identifies the action being monitored, the specific purpose of the monitoring, methods used in monitoring, data collected, analysis of the data, findings, and recommendations for further action. The report should be submitted to the UNAC for review and comment and to the County Council for its consideration.

**Recommendations for Further Action**

In addition to determining the effectiveness of the plan in fulfilling the vision of the Upper Nisqually community, a key component to monitoring would be the recommendations for further action. These recommendations should clearly identify the specific vision statement
being addressed, how the recommended action corrects a deficiency in the plan, how the recommended action will contribute to fulfilling the vision statement, and a timeline for completing the proposed action.
